Presented 5th December, 1906, by Sir Wilfrid Laurier..... *Not printed.*
52. Return under chapter 131 (R.S.C.), intituled: "An Act respecting Trade Unions," and submitted to parliament in accordance with section 23 of the said Act. Presented 5th December, 1906, by Sir Wilfrid Laurier *Not printed.*
53. Return to an address of the House of Commons, dated 19th March, 1906, for copies of all orders in council and documents, between the first day of July, 1896, and the present time, relating to swamp lands; and of all letters, telegrams and other documents and correspondence between the government of Canada and the government of Manitoba, during the same period, relating to such lands. Presented 5th December, 1906.—*Mr. Staples*..... *Not printed.*
- 53a. Supplementary return to No. 53. Presented 11th December, 1906..... *Not printed.*
54. Return (in so far as the Department of the Interior is concerned) of copies of all orders in council, plans, papers, and correspondence which are required to be presented to the House of Commons, under a resolution passed on 20th February, 1882, since the date of the last return, under such resolution. Presented 5th December, 1906, by Hon. F. Oliver..... *Not printed.*
55. Return to an order of the House of Commons, dated 28th November, 1906, showing the number of commercial agencies for the Dominion in operation during the fiscal years 1905 and 1906, the names of the several agents, where located, their salaries, contingent expenses, the total cost of each agency, and the aggregate cost of all the agencies combined. Presented 6th December, 1906.—*Mr. Wilson (Lennox and Addington)*..... *Not printed.*
56. Return of orders in council passed under provisions of the Dominion Lands Act, affecting lands in the Yukon Territory; and of orders or ordinances passed under the provisions of section 8 of the Yukon Territory Act, as that section was enacted by section 3 of chapter 34, 2 Edward VII. Presented 6th December, 1906, by Hon. F. Oliver..... *Not printed.*
57. Return of orders in council, under the provisions of section 52 of the Northwest Irrigation Act. Presented 6th December, 1906, by Hon. F. Oliver..... *Not printed.*
58. Return of orders in council which have been published in the *Canada Gazette* and in the *British Columbia Gazette*, between 20th January and 1st December, 1906, in accordance with provisions of subsection (d) of section 38 of the regulations for the survey, administration, disposal and management of Dominion lands within the 40-mile railway belt in the province of British Columbia. Presented 6th December, 1906, by Hon. F. Oliver *Not printed.*
59. Return of orders in council which have been published in the *Canada Gazette* between 20th January and 1st December, 1906, in accordance with the provisions of clause 91 of the Dominion Lands Act, chapter 54, of the Revised Statutes of Canada, and its amendments. Presented 6th December, 1906, by Hon. F. Oliver.... *Not printed.*
60. Return to an order of the House of Commons, dated 29th November, 1906, for a copy of the proclamations used in the elections of 1904, in the constituencies of Selkirk, Provencher, Macdonald, Lisgar, Marquette, Souris, Brandon and Portage la Prairie. Presented 10th December, 1906.—*Mr. Roche (Marquette)*..... *Not printed.*
61. Report of the Ottawa Improvement Commission for the fiscal year ended 30th June, 1906. Presented 10th December, 1906, by Hon. W. S. Fielding..... *Not printed.*

 CONTENTS OF VOLUME 13—*Continued.*

- 61a.** Orders in Council relative to the appointment of Commissioners under the provisions of chapter 10 of the Acts of 1899, intituled: "An Act respecting the city of Ottawa." Presented 28th January, 1907, by Sir Wilfrid Laurier..... *Not printed.*
- 62.** Report of the Commissioners of the National Transcontinental Railway, under date of 9th October, 1906, on the surveys and other works under their charge for the year ended 30th June, 1906, in pursuance of subsection 2 of section 30, chapter 71, of 1903. Presented 10th December, 1906, by Hon. H. R. Emmerson..... *Printed for both distribution and sessional papers.*
- 62a.** Return to an order of the House of Commons, dated 28th November, 1906, for a copy of all reports and plans of engineers regarding the line and location of the Grand Trunk Pacific Railway between the city of Quebec and Edmundston, New Brunswick, and more particularly the city of Quebec, and Lake Pheonegamook, in the county of Kamouraska. Presented 9th January, 1907.—*Mr. Monk.* *Not printed.*
- 62b.** Return to an address of the House of Commons, dated 28th November, 1906, for a copy of all orders in council, surveys, reports, documents, and papers of every kind not already brought down, touching, showing or relating to the route of the National Transcontinental Railway between the city of Quebec and the city of Moncton. Presented 9th January, 1907.—*Mr. Crocket* *Not printed.*
- 62c.** Return to an address of the House of Commons, dated 18th December, 1906, for a copy of all orders in council, advertisements for tenders, tenders, specifications of every kind, plans, drawings, reports, letters, telegrams, correspondence, contracts, agreements and other documents and papers of every kind, touching or relating to the construction of a section of the Transcontinental Railway designated as "District F," from a point at or near the city of Winnipeg, to a point known as Peninsular Crossing, near the junction point of the Fort William branch of the Grand Trunk Pacific Railway, a distance of about 245 miles. Presented 29th January, 1907.—*Mr. Borden (Carleton).* *Not printed.*
- 62d.** Return to an address of the House of Commons, dated 17th December, 1906, for a copy of all orders in council, advertisements for tenders, tenders, specifications of every kind, plans, drawings, reports, letters, telegrams, correspondence, contracts, agreements and other documents and papers of every kind, touching or relating to the construction of a section of the Transcontinental Railway, designated as "District B," beginning at the north end of the Quebec Bridge and Railway Company's bridge, in the vicinity of the city of Quebec, to a point near La Tuque, a distance of about 150 miles. Presented 29th January, 1907.—*Mr. Borden (Carleton).*..... *Not printed.*
- 62e.** Return to an order of the House of Commons, dated 6th February, 1907, for a copy of plans, documents, &c., now under consideration by the Transcontinental Commission and Railway Commission pertaining to the development and improvement of Quebec Harbour as a maritime port and railway terminus. Presented 25th February, 1907.—*Mr. Robitaille*..... *Not printed.*
- 62f.** Return to an address of the House of Commons, dated 23rd January, 1907, for a copy of all papers, correspondence, reports, plans and profiles, and estimates of costs at any time received by or filed with the Commissioners of the National Transcontinental Railway, or with the Department of Railways, respecting: (a) That portion of the route of the said railway between the Quebec bridge and the vicinity of the Maine boundary line, as the route for such portion has been approved or adopted, or respecting any suggested variations of the location of such portion of the railway; (b) respecting another suggested route for the said portion of the said railway between the points aforesaid, not passing by way of Lake Etchemin, and sometimes known as the Morin route. 2. For a copy of all orders in council approving, adopting, or respecting any such routes between the points aforesaid. Presented 26th February, 1907.—*Mr. Morin*..... *Not printed.*
- 62g.** Return to an order of the House of Commons, dated 4th March, 1907, for a copy of all memoranda in the possession of the government, showing the amounts from month to month reported by the company and verified by the officers of the government, as having been duly expended in connection with the construction of the western division of the National Transcontinental Railway, whereon the government of Canada guarantees the bonds to the extent of 75 per cent of the cost. Presented 14th March, 1907.—*Mr. Ames*..... *Not printed.*
- 62h.** Return to an order of the House of Commons, dated 24th April, 1907, for copies of papers in relation to the Transcontinental Railway route through New Brunswick. Presented 24th April, 1907.—*Hon. W. S. Fielding*..... *Not printed.*

 CONTENTS OF VOLUME 13—*Continued.*

- 63.** Return to an order of the House of Commons, dated 3rd December, 1906, showing what properties, if any, have been purchased by the government during the past two years, in the city of Ottawa, between Sussex Street and Mackenzie Avenue; the properties acquired by the government in that locality; the names of the vendors; the dates of the purchases, the price agreed upon in each case; the superficies of the property acquired; the date on which the government took possession in each case. Presented 11th December, 1906.—*Mr. Morin* *Not printed.*
- 64.** Return to an address of the House of Commons, dated 28th November, 1906, for a copy of all orders in council passed during the last three years, relating to the formation of any new territory or district, or the alteration of the boundaries of any territory or district in Canada. Presented 11th December, 1906.—*Mr. Sifton* *Not printed.*
- 64a.** Return to an address of the House of Commons, dated 28th November, 1906, for a copy of all letters, communications, memorials, petitions, or documents, received during the past three years from the government of any province in the Dominion, or any member thereof, by the government of Canada, or any member thereof, relating to the extension or alteration of the boundaries of any province of Canada. Presented 17th December, 1906.—*Mr. Sifton.*
Printed for both distribution and sessional papers.
- 65.** Return to an order of the House of Commons, dated 3rd December, 1906, for a copy of contracts with transatlantic steamship lines, in force during the season of 1906, that were entitled by such contract to receive bonuses or subventions from the government. Presented 11th December, 1906.—*Mr. Smith (Wentworth)* *Not printed.*
- 66.** Return to an order of the House of Commons, dated 28th November, 1906, for a copy of all letters, telegrams, correspondence, reports, documents and papers, with respect to filling the vacancy on the bench of the Supreme Court of Nova Scotia, occasioned by the appointment of Honourable D. C. Fraser to the office of Lieutenant Governor. Presented 14th December, 1906.—*Mr. Borden (Carleton)* *Not printed.*
- (66.** Sessional Papers of 1906). Evidence taken before the Royal Commission on Life Insurance. Presented 26th February, 1907, by Hon. W. S. Fielding *Printed for distribution.*
- 67.** Report of the Deputy Minister of Labour on negotiations conducted by him under Conciliation Act, 1903, in connection with the strike of coal miners in the employ of the Alberta Railway and Irrigation Company, which commenced on 9th March, 1906. Presented 14th December, 1906, by Hon. R. Lemieux *Not printed.*
- 68.** Return to an order of the House of Commons, dated 28th November, 1906, for a copy of all papers and correspondence in connection with the Buckingham strike and riots. Presented 14th December, 1906, by Hon. R. Lemieux *Not printed.*
- 68a.** Supplementary return to No. 68. Presented 9th January, 1907.—*Mr. Bourassa* *Not printed.*
- 68b.** Return to an address of the Senate, dated 23rd of January, 1907, for a copy of all papers and correspondence having reference to the calling out of militia and to the intervention of the government in the late strikes and riots in Hamilton and Buckingham; also giving a statement showing the amounts paid by the government and municipalities in each case, for the services of the militia in connection with strikes; together with a statement showing in which cases, if any, the government was recouped by the municipalities, the amount paid the militia, and the amounts. Presented 19th February, 1907.—*Hon. Mr. David* *Not printed.*
- 69.** Return to an order of the House of Commons, dated 3rd December, 1906, showing all, if any, islands or portions of islands sold since the first day of July, 1896, adjoining the townships of Baxter and Gibson, in the district of Muskoka, on the Georgian Bay, and the prices received therefor, respectively. Presented 17th December, 1906.—*Mr. Wright (Muskoka)* *Not printed.*
- 70.** Return to an order of the House of Commons, dated 29th November, 1906, for a copy of all circulars sent out by the immigration office during the present year to agents of the department in the United Kingdom, and on the continent of Europe; also to booking agents in the United Kingdom and on the continent. Presented 17th December, 1906.—*Mr. Chisholm (Huron)* *Not printed.*
- 70a.** Return to an order of the House of Commons, dated 5th December, 1906, for a copy of all papers, circulars, instructions, or other correspondence, sent out by the Department of the Interior, or any officer thereof, relative to immigration; and all correspondence or papers, &c., relative thereto, from agents abroad during the year 1906, with special reference to question No. 2, on the Order Paper of 3rd December, 1906. Presented 17th December, 1906.—*Mr. Lefurgey* *Not printed.*

 CONTENTS OF VOLUME 13—*Continued.*

71. Return to an order of the House of Commons, dated 28th November, 1906, for a copy of all letters, documents, telegrams, reports, writs of supersedeas, and other papers, relating to the standing and different grades in the civil service, from time to time, of Henry J. Morgan, and his superannuation. Presented 18th December, 1906.—*Mr. Stewart*..... *Not printed.*
72. Returned to an order of the House of Commons, dated 28th November, 1906, showing: 1. The names of fire insurance companies which have received their charters within the past five years. 2. The names of the parties applying for the same. 3. The amount of subscribed capital required under the charter. 4. The amount of paid-up capital required under the charter. 5. The proposed location of the head office in each case. Presented 17th December, 1906.—*Mr. Macdonell*.. *Not printed.*
73. Return to an order of the House of Commons, dated 3rd December, 1906, showing: quantity or value of green fruit, canned fruits, and vegetables, fruit jams, preserves and jellies, classifying them wherever practicable, imported into Canada, and exported therefrom, during each of the past ten years; stating also whether from Great Britain, United States, or other countries; and during the past two years, the quantity imported through ports of entry, first, in Eastern Provinces; second, Prairie Provinces; third, British Columbia. Presented 9th January, 1907.—*Mr. Smith (Wentworth)* *Not printed.*
74. Return to an order of the House of Commons, dated 17th December, 1906, showing: 1. The total amount of duty received by the government in the fiscal year 1906 upon the respective articles named in the following items, as numbered, of the new Customs Tariff, viz: Item 445.—Mowing machines, harvesters, self-binding or without binders, binding attachments, reapers. Item 446.—Cultivators, ploughs, harrows, horse-rakes, seed drills, manure-spreaders, weeders and wind-mills. Item 447.—Threshing machine outfit, when consisting of traction or portable engines and separators. Item 448.—Hay loaders, potato diggers, horse-powers, separators, n.o.p., wind-stackers, fodder or feed cutters, grain crushers, fanning mills, hay tedders, farm, road or field rollers, post-hole diggers, snaths, and other agricultural implements, n.o.p. Item 449.—Axes, scythes, sickles or reaping hooks, hay or straw knives, edging knives, hoes, rakes, n.o.p., and pronged forks. Item 450.—Shovel and spades, iron or steel, n.o.p., shovel and spade blanks, and iron or steel cut to shape for the same, and lawn mowers. Item 451.—Stoves of all kinds, for coal, wood, oil, spirits or gas. 2. The total amount of duty that would have been received in the same period, the fiscal year of 1906, had the tariff now proposed by the government been then in force, giving such duty for each of the items 445, 446, 447, 448, 449, 450 and 451, separately. Presented 9th January, 1907.—*Mr. Henderson*..... *Not printed.*
75. Report of the Commissioner, Dominion Police Force, for the year 1906. Presented 9th January, 1907, by Hon. A. B. Aylesworth..... *Not printed.*
76. Return to an order of the House of Commons, dated 10th December, 1906, for a copy of all writs, forms and instructions issued and used in and for the purposes of the elections for the constituency of London, in the year 1905, and for the elections for the constituencies of East Elgin and North Bruce, in the year 1906. Presented 9th January, 1907.—*Mr. Barker*..... *Not printed.*
77. Return to an order of the House of Commons, dated 18th April, 1906, for a copy of all petitions, memorials, reports, letters, documents, correspondence and papers, setting forth or relating or referring to the necessity of improved aids to navigation, and of the life-saving vessels or appliances on the Pacific coast. Presented 9th January, 1907.—*Mr. Borden (Carlton)*..... *Not printed.*
78. Return to an order of the House of Commons, dated 18th April, 1906, for a copy of all reports, findings and recommendations of any officer, court of inquiry or commission, respecting the loss of any steamship or vessel on the Pacific coast during the past six years, except such as have already been published in the Annual Report of the Department of Marine. Presented 9th January, 1907.—*Mr. Borden (Carlton)*..... *Not printed.*
79. Return to an order of the House of Commons, dated 21st March, 1906, showing: How many wrecks there were on the Pacific coast in Canadian waters in 1900, 1901, 1902, 1903, 1904, 1905, and in 1906, up to date, British and foreign; number of lives lost in each wreck; the total financial loss in ships and cargoes; the inquiries made by the government into the causes of such wrecks; the causes given for such wrecks; the results of reports made of such investigations, as to hulls or machinery, by the British Columbia inspectors; the port of registry of each vessel wrecked; the age of each ship. Presented 9th January, 1907.—*Mr. Smith (Nanaimo)*..... *Not printed.*

 CONTENTS OF VOLUME 13—*Continued.*

80. Return to an order of the House of Commons, dated 10th December, 1906, showing : The quantity of oil from the wells of the Memramcook and Dover, sold and delivered to the Intercolonial Railway, between the 1st of January, 1904, and the 31st of March, 1906 ; such statement to set forth in detail the dates, quantity, price, and total value of each of such shipments. And further for a similar statement giving like information in respect of all other oil purchased from or through the agency of the New Brunswick Petroleum Company, being the output of other wells than those herein above specified. Presented 9th January, 1907.—*Mr. Barker*..... *Not printed.*
81. Return to an order of the House of Commons, dated 10th December, 1906, showing : All sums paid from 1st January, 1904, to date, to George H. Cochrane, of Moncton, for supplies furnished or services rendered the Intercolonial Railway ; such statement in respect of each item in every such transaction, when and by whom the order was given, nature of and the quantity of goods furnished, character of services rendered, prices paid, and the names of the parties who certified to the correctness of his account. Presented 9th January, 1907.—*Mr. Barker*..... *Not printed.*
82. Return to an order of the House of Commons, dated 18th December, 1906, giving comparative statement of the standard passenger tariff in force on the Intercolonial Railway in 1904, and that in force at the present time, said statement to be so arranged as to show the former and present passenger rates in convenient form for purposes of comparison, in each of the following cases : 1. From Truro (*a*) to Hopewell, to New Glasgow, to Pictou, to Antigonish, to Port Mulgrave, to Grand Narrows, to Sydney, to Glace Bay, to Louisburg ; (*b*) to Halifax, (*c*) to Londonderry, to Amherst, to Sackville, to Shediac, to Moncton, to Cape Tormentine. 2. From Moncton (*a*) to Salisbury, to Sussex, to Norton, to St. John ; (*b*) to Kent Junction, to Weldford, to Newcastle, to Dalhousie, to Campbellton. 3. From Lévis (*a*) to Berthier-en-bas, to St. Thomas de Montmagny, to Ste. Anne de la Pocatière, to River du Loup, to Rimouski, to Causapscal, to Metapedia ; (*b*) to Drummondville, to Ste. Rosalie, to Montreal. Presented 9th January, 1907.—*Mr. Ames*..... *Not printed.*
83. Return to an order of the House of Commons, dated 10th December, 1906, for a copy of all reports, investigations, orders, or correspondence, since 1st January, 1905, dealing with or touching upon alleged misconduct or remissions of duty on the part of (*a*) I. L. Burrill, paymaster on the Intercolonial Railway ; (*b*) Moses Tracey, inspector of car cleaners ; (*c*) Bruce McDougall, of the Intercolonial Railway Audit Office, Moncton ; together with a copy of the rules and regulations in force since above date, and at the present time, with reference to the employees of the Intercolonial Railway. Presented 9th January, 1907.—*Mr. Barker*..... *Not printed.*
84. Return to an order of the House of Commons, dated of 28th November, 1906, for a copy of the report furnished to the government by Messieurs Brunet and Duff, of Montreal, regarding the water-powers on the Lachine Canal. Presented 9th January, 1907.—*Mr. Monk*..... *Not printed.*
85. Return to an order of the House of Commons, dated 10th December, 1906, showing, by means of a comparative statement, the difference in rates charged, in respect of the ten classes of articles most largely carried, under the standard freight tariff in force during 1904, and that in force at the present time upon the Intercolonial Railway, from station to station, as hereinafter specified : 1. From Truro (*a*) to Hopewell, to New Glasgow, to Pictou, to Antigonish, to Port Mulgrave, to Grand Narrows, to Sydney, to Glace Bay, to Louisburg ; (*b*) to Halifax ; (*c*) to Londonderry, to Amherst, to Sackville, to Shediac, to Moncton, to Cape Tormentine. 2. From Moncton (*a*) to Salisbury, to Sussex, to Norton, to St. John ; (*b*) to Kent Junction, to Weldford, to Newcastle, to Dalhousie, to Campbellton. 3. From Lévis (*a*) to Berthier-en-bas, to St. Thomas de Montmagny, to Ste. Anne de la Pocatière, to River du Loup, to Rimouski, to Causapscal, to Metapedia ; (*b*) to Drummondville, to Ste. Rosalie, to Montreal. Presented 9th January, 1907.—*Mr. Ames*..... *Not printed.*
86. Return of all lands sold by the Canadian Pacific Railway Company, from the 1st October, 1905, to the 1st October, 1906. Presented 9th January, 1907, by Hon. F. Oliver..... *Not printed.*
87. Return to an order of the House of Commons, dated 5th December, 1906, for a copy of all documents relating to the application of R. C. McCracken for the northeast quarter, section 36, township 35, range 16, west of the second meridian, province of Saskatchewan ; also Mr. McCann, for the northwest quarter of the same section. Presented 9th January, 1907.—*Mr. Barr*..... *Not printed.*
88. Return to an order of the House of Commons, dated 17th December, 1906, showing : 1. The names, ages, sexes and parentage of children attending Muscoweguan's Indian boarding school, specifying whether treaty or non-treaty Indians, the band they belong to, and whether parents alive or not. 2. Amount of government grants made to the school during the years 1904, 1905 and 1906. 3.

 CONTENTS OF VOLUME 13—*Continued.*

- Amount of treaty money paid to Muscoweguan's band at the last payments, to what Indians were the payments made, and the number of children belonging to each. Presented 9th January, 1907.—*Mr. Lake* *Not printed.*
89. Return to an order of the House of Commons, dated 5th December, 1906, for: 1. A copy of the evidence taken at the investigation promised by the Minister of the Interior at the last session of parliament into the conduct of W. T. R. Preston, Commissioner of Immigration in England; together with copies of all letters, documents, and papers, in any way relating thereto. 2. Copy of the report of the party or parties who held the investigation which was promised by the Honourable Mr. Oliver, Minister of the Interior, when the matter of the dismissal of Mr. W. T. R. Preston was under discussion at the last session of parliament. 3. Of all correspondence between W. T. R. Preston and any member of the government, or any department thereof, with reference to his present appointment. 4. And showing what government position W. T. R. Preston now holds, what his duties are, what salary he gets, what living and travelling expenses he is allowed. Presented 9th January, 1907.—*Mr. Wilson (Lennox and Addington)* *Not printed.*
90. Return to an address of the House of Commons, dated 28th November, 1906, for a copy of all orders in council, agreements, valuations, reports, memoranda, letters, telegrams, correspondence and other documents and papers, touching, relating to or concerning the grant by or on behalf of the government of Canada, of any lands in Southern Alberta, under conditions contemplating or requiring the construction of irrigation works, and all such documents as aforesaid relating to any concession or grant of about 380,575 acres of land to the Robins Irrigation Company. Presented 9th January, 1907.—*Mr. Borden (Carleton)* *Not printed.*
- 90a. Return to an address of the House of Commons, dated 28th November, 1906, for a copy of all orders in council, agreements, papers and correspondence in connection with the sale of 380,600 acres, more or less, of land in Southern Alberta, to the Robins Irrigation Company; and the list of shareholders of the company, and its officers. Presented 10th January, 1907.—*Mr. Borden (Carleton)*.
Not printed.
- 90b. Return to an order of the House of Commons, dated 3rd December, 1906, for a copy of all documents relating to the application of, (a) J. T. Robins, for land in townships 10, 11 and 12, ranges 7, 8, 9, 10, 11, 12, west of the 4th; and of (b) E. H. Cuthbertson, for land in townships 11, 12, 13, ranges 7, 8, 9, 10, 11 and 12, west of the 4th, for purposes of irrigation. Presented 10th January, 1907.—*Mr. Ames*. *Not printed.*
91. Return to an address of the House of Commons, dated 3rd December, 1906, for a copy of all orders in council, leases, agreements, valuations, reports, memoranda, letters, telegrams, correspondence, and other documents and papers, relating to, (a) the granting of grazing lease No. 2013, issued to J. D. McGregor, and of grazing lease No. 2014, issued to A. E. Hitchcock; (b) the assignment of said lease privileges to, or the enjoyment of the same, by the Grand Forks Cattle Company; (c) and further transfer or sale of said privileges by the Grand Forks Cattle Company; (d) all transactions between the government and the assigns of the Grand Forks Cattle Company. Presented 9th January, 1907.—*Mr. Ames*. *Not printed.*
- 91a. Return to an address of the House of Commons, dated 3rd December, 1906, for a copy of all orders in council, leases, agreements, valuations, reports, memoranda, letters, telegrams, correspondence, and other documents and papers, touching, relating to, or concerning, (a) the granting of grazing lease No. 2009, issued to C. E. Hall; (b) the enjoyment of said lease privileges by C. E. Hall; (c) the assignment of the same to the Milk River Cattle Company; (d) the enjoyment of the same by the Milk River Cattle Company; together with a statement showing all amounts received by the government by way of rentals, bonuses, or otherwise, from each of the parties herein above-mentioned, with date, amount, and object of each such payment. Presented 9th January, 1907.—*Mr. Ames*.
Not printed.
- 91b. Return to an address of the House of Commons, dated 3rd December, 1906, for a copy of all orders in council, leases, agreements, valuations, reports, memoranda, letters, telegrams, correspondence, and other documents and papers, touching, relating to, or concerning, (a) the granting of grazing lease No. 2059, issued to H. P. Brown, of Grand Forks, Montana; (b) the assignment of said lease privileges to the Galway Horse and Cattle Company; and the enjoyment thereof by said company; (c) the further assignment of said lease privileges by the Galway Horse and Cattle Company to John Cowdry, of Macleod, and his enjoyment of the same, together with a statement showing all rentals or bonuses received by the government from any of the above parties, with date, amount, and purpose of each payment. Presented 9th January, 1907.—*Mr. Ames*. *Not printed.*

 CONTENTS OF VOLUME 13—*Continued.*

- 91c.** Return to an address of the House of Commons, dated 9th January, 1907, for a copy of all orders in council, agreements, valuations, reports, memoranda, letters, telegrams, correspondence and documents of every description, relating to or treating of (a) the granting of a closed grazing lease to Brown, Bedingfield, *et al*; (b) the enjoyment of and the payment for the privileges granted under said lease. Presented 7th February, 1907.—*Mr. Ames*.....*Not printed.*
- 91d.** Return to an order of the House of Commons, dated 23rd January, 1907, for a copy of all applications for the lease of grazing lands within the provinces of Alberta and Saskatchewan, between the 1st day of February, 1905, and the 1st day of August, 1905. Presented 19th April, 1907.—*Mr. McCarthy (Calgary)*.....*Not printed.*
- 92.** Return to an order of the House of Commons, dated 28th November, 1906, showing: 1. All sums of money paid to the North Atlantic Trading Company, or on their order, to 1st November, 1906, with dates, sums, and names of persons to whom paid. 2. Presented 15th January, 1907.—*Mr. Foster* *Not printed.*
- 102*a*.** Return to an order of the House of Commons, dated 14th January, 1907, for a copy of all letters, telegrams, reports, memoranda and other documents and papers, respecting supplies purchased or ordered for or in connection with the government steamer *Kestrel*, from January 1st, 1903, up to the present time, including all correspondence between any department, officer or agent of the government, and the captain of the said steamer. Presented 12th April, 1907.—*Mr. Reid (Greenville)*.
Not printed.
- 103.** Return to an order of the House of Commons, dated 10th December, 1906, showing the local and general tariffs of each and every through transportation line, railway or steamship line, giving in detail the rates upon each class of commodity from station to station; and also upon commodities passing through Canada, or from Canada to foreign countries, or to Great Britain and Ireland. Presented 17th January, 1907.—*Mr. Hughes (Victoria)*. *Not printed*
- 104.** Return to an order of the House of Commons, dated 3rd December, 1906, showing for five years past the annual shipments across the Atlantic of: butter, cheese, apples, pears, other fruits and other products, classifying them (*a*) in cold storage; (*b*) in cool air compartments; (*c*) in ordinary storage. Presented 17th January, 1907.—*Mr. Smith (Wentworth)*. *Not printed.*
- 105.** Return to an address of the House of Commons, dated 28th November, 1906, for a copy of all orders in council, reports, letters, telegrams, correspondence, memoranda and other documents and papers, relating to or in any way touching the purchase or acquisition of land in or near the city of Halifax, since 1st January, 1902, for the purpose of constructing thereon a round-house or machine shop. Presented 17th January, 1907.—*Mr. Barker*. *Not printed.*
- 106.** Return to an address of the Senate, dated 19th June, 1906, for copies of all correspondence between the Imperial authorities and the government of Canada relating to the uniform to be worn upon state occasions by privy councillors of the cabinet, privy councillors not of the cabinet, deputy heads of departments, and by any other of the government officials. Presented 16th January, 1907.—*Hon. Mr. Landry* *Not printed*
- 107.** Return to an address of the Senate, dated 7th December, 1906, for copies of all correspondence respecting a site or sites for a public building in the town of Glace Bay, Nova Scotia, between any member of the government and all other parties; the area of the sites, the price of each, the date of the purchase, the date of each payment, the name of the seller of each site, the report or reports of the government engineer, showing lots recommended and those not recommended by him, and all notes or memoranda referring to said sites. Presented 16th January, 1907.—*Hon. Mr. McDonald (Cape Breton)* *Not printed*
- 108.** Return to an address of the Senate, dated 5th December, 1906, for a copy of all the correspondence exchanged between the department of marine and fisheries, or any person or any company whatsoever on the subject of the stranding at Matane of the steamer *Kensington*, as well as of the inquiry which has been made into this subject and of the judgment rendered by the commissioner making the inquiry. Presented 16th January, 1907.—*Hon. Mr. Landry*. *Not printed.*
- 109.** Return to an address of the Senate, dated 28th November, 1906, of imports of oxide of aluminum for the years 1903, 1904, 1905 and to date, 1906, with values. Presented 16th January, 1907.—*Hon. Mr. Domville* *Not printed.*
- 109*a*.** Return to an order of the Senate, dated 28th November, 1906, giving the amount of aluminum exported for the years 1903, 1904, 1905 and to date, 1906, with values. Presented 16th January, 1907.—*Hon. Mr. Domville*. *Not printed.*
- 110.** Supplementary return to an order of the House of Commons, dated 14th March, 1906, showing, in the case of every homestead against which, during the years 1904 and 1905, a report of non-compliance with the law, or a demand for cancellation has been received by the Dominion land office or offices; giving (*a*) the location of said quarter-section, range, township, and meridian; (*b*) the name and address of the party by whom the original entry was made; (*c*) the name and address of the party or parties (if there have been several) who endeavoured to lodge cancellations; (*d*) the reason alleged by complainants why cancellation of entry should be allowed; (*e*) whether warning of threatened cancellation was served upon the alleged delinquent; (*f*) the action taken by the department in each case. Presented 21st January, 1907.—*Mr. Ames*. *Not printed.*

 CONTENTS OF VOLUME 13—*Continued.*

- 111.** Return to an address of the House of Commons, dated 10th December, 1906, for a copy of all orders in council, agreements, contracts, reports, telegrams, letters, and other documents, relating to any agreement between the government, or any department of the government, and Mr. W. A. D. Lees, or any other person or persons, for fencing a part or tract of land near Fort Saskatchewan, in Alberta; and all such documents and papers aforesaid, relating to the maintenance of such fence. Presented 21st January, 1907.—*Mr. Roche (Marquette)*..... *Not printed.*
- 112.** Return to an order of the House of Commons, dated 17th December, 1906, for a copy of the ordinance or regulation of the Canadian militia by which young men following the three months' short course, day attendance, are stipulated as having no right to any indemnity for their services; also a copy of the ordinance or regulation of the Canadian militia by which young men from the country are not entitled to any pay for provisionary course, night attendance. Presented 21st January, 1907.—*Mr. Robitaille*..... *Not printed.*
- 113.** Extract from a Report of the Committee of the Privy Council, approved by the Governor General on the 24th day of December, 1906, in relation to the leasing of the Beauharnois Canal, in order to its utilization for the development of electricity for lighting and industrial purposes. Presented 21st January, 1907, by Sir Wilfrid Laurier *Not printed.*
- 114.** Return to an order of the House of Commons, dated 14th January, 1907, showing: 1. All amounts which have been since 1st July, 1904, expended, chargeable to capital account, upon the strengthening of bridges along the line of the government railways. 2. The estimated cost of each work, which it is proposed to carry on during the fiscal year 1907-8. Presented 21st January, 1907.—*Mr. Crockett*..... *Not printed.*
- 115.** Return to an order of the House of Commons, dated 14th January, 1907, for a copy of all correspondence, petitions and other papers, addressed to, or received by the department of railways and canals, from any persons, organizations, or associations, asking for the institution of a system of annuities for employees on the Intercolonial Railway. Presented 21st January, 1907.—*Mr. Macdonald*..... *Not printed.*
- 116.** Return to an order of the House of Commons, dated 26th March, 1906, for a statement containing the following information concerning the water-powers in the possession and under the control of the Dominion government. 1. The province and the locality within the province where the water-power is situated. 2. A summary of the report or reports made to the government on such water-power, if any report has been made, with date of the report and name of the party who has reported. 3. The power susceptible of being developed. 4. If under lease or alienated in any way, the name of lessee or purchaser, date, duration and condition of lease or purchase. 5. If under lease or alienated, whether public tenders were called for through the newspapers before lease or alienation took place. 6. If under lease or alienated, whether any report was sought and obtained by the government previous to such alienation, and by what officer such report was made to the government, and the purport of such report, as well as its date. 7. If under lease or alienation in any way, the amount due the government for rent or price of sale and arrears. 8. If under lease or alienated, whether the conditions of alienation have been fulfilled. Presented 21st January, 1907.—*Mr. Monk*.
Printed for both distribution and sessional papers.
- 116a.** Return to an address of the House of Commons, dated 28th November, 1906, for: 1. A copy of the contract or agreement by which the government has leased or alienated the water-powers on the Soulanges canal; of the tenders, if any were invited, before the disposal of said water-powers; and of any and all correspondence concerning the said powers before the disposal of the same by the government. 2. A copy of the order in council disposing of said water-powers. 3. A copy of all transfers of said water-powers since the original alienation of the same; of all correspondence relating to said transfers; and of orders in council authorizing or ratifying said transfers. 4. A copy of all reports and estimates in the possession of the government in regard to the extent and value of water-powers on the Soulanges canal. Presented 14th February, 1907.—*Mr. Monk*.... *Not printed.*
- 116b.** Return to an order of the House of Commons, dated 10th December, 1906, showing: (1) The water-powers, and location of same, along the Trent Canal waterways, still in possession of the government of Canada; (2) those along tributary waters under the same control; (3) the water-powers that have been leased, or otherwise disposed of; (4) the terms in each case; (5) the nature of the title in each instance. Presented 14th February, 1907.—*Mr. Hughes (Victoria)*..... *Not printed.*
- 116c.** Return to an order of the House of Commons, dated 27th February, 1907, for copies of all reports and other papers in connection with the choice of the eastern outlet for the Trent Valley Canal. Presented 27th February, 1907.—*Mr. Emmerson* *Not printed.*

 CONTENTS OF VOLUME 13—*Continued.*

- 116d.** Report of E. J. Walsh, C.E., Engineer in charge of the surveys on the Trent Valley Canal, from Lake Simcoe to Georgian Bay, accompanied by plans, profiles and estimates. Presented 15th March, 1907, by Hon. H. R. Emmerson..... *Not printed.*
- 117.** Return to an order of the House of Commons, dated 5th December, 1906, for a copy of all letters, telegrams or documents of any description, relating to, (a) the appointment of Mr. F. W. Aylmer to the position of resident engineer of the Dominion Public Works at Winnipeg; and (b) his resignation of said position, together with all letters, telegrams, &c., interchanged between Mr Aylmer and any official of the public works department, in this connection. Presented 21st January, 1907.—*Mr. Amcs*..... *Not printed.*
- 118.** Return to an address of the House of Commons, dated 28th November, 1906, for a copy of all correspondence, tenders, offers of lease or purchase or occupation, of water powers under the control of the government of Canada, and of any deed of alienation of the same, whether by lease or otherwise, situate within one hundred miles of the city of Montreal. Presented 21st January, 1907.—*Mr. Monk*..... *Not printed.*
- 119.** Return to an order of the House of Commons, dated 9th January, 1907, for a copy of all papers and correspondence in connection with registered letters lost between Bethany and Millbrook, and other points in the county of Durham; more especially concerning a letter posted by one Joseph Hadden, of Bethany, to the Bank of Toronto, at Millbrook. Presented 24th January, 1907.—*Mr. Ward*.
Not printed.
- 120.** Return to an order of the House of Commons, dated 3rd December, 1906, for a copy of all thermograph records of temperature on ocean-going vessels taken during the past season; stating names of vessel, and date of sailing, and port from whence sailing; also, stating if in cold storage chambers, cool air chambers, ventilated chambers, or unventilated chambers; also, in case of ventilated chambers, stating the method of ventilation. Presented 24th January, 1907.—*Mr. Smith (Wentworth)*.
Not printed.
- 121.** Return to an address of the House of Commons, dated 17th December, 1906, for a copy of: 1. All reports made from time to time by the officers of the topographical surveys branch of the department of the interior, in reference to land in townships 10, 11, 12 and 13, ranges 7, 8, 9, 10, 11, 12 and 13, west of the 4th, and townships 7, 8 and 9, ranges 8, 9, 10 and 11, west of the 4th. 2. Orders in council dated the 13th December, 1886, and 21st December, 1897, setting apart certain lands, viz.: those portions of the south half of section 7, the northwest quarter of section 9, and section 21, lying south and east of the river, township 12, range 12; that part of section 35 lying south and east of the river, township 11, range 13, and those portions of sections 1 and 2, lying east of the river in township 12, range 13, all west of the 4th meridian, as reserved for watering of stock. 3. Report of inspection referred to in order in council of 21st December, 1903, showing that the land referred to in orders in council dated 13th December, 1886, and 21st December, 1897, were no longer required for the purpose for which they were reserved. 4. All other reports made from time to time to date by officers of the department of the interior regarding the character and fertility of the soil, climate, rainfall, water supply, or topographical features of the area, or any part of the area described in paragraph 1 of this resolution. Presented 28th January, 1907.—*Mr. Amcs*..... *Not printed.*
- 122.** Orders in Council authorizing the granting of permits to foreigners and foreign corporations to bring fresh fish in American bottoms to any port in British Columbia, to land such fresh fish at such port without payment of duties and tranship the same in bond to any part of the United States of America, &c. Presented 28th January, 1907, by Sir Wilfrid Laurier..... *Not printed.*
- 123.** Return to an order of the House of Commons, dated 28th November, 1906, for a copy of all correspondence between the government, or any member or official thereof, and any member of the Royal Insurance Commission, or Mr. Shepley, K.C., or Mr. Tilley, barrister, or any other person employed by or on behalf of the government, relating in any way to the work of the commission, to the subjects and methods of conducting the inquiry, to suggestions as to what witnesses be called, what information be sought, and from whom; together with any reports received or transmitted in reference to the above; and also, for a copy of all instructions issued by the government, or any member thereof, to the commission, or any counsel employed thereat. Presented 29th January, 1907.—*Mr. Borden (Carleton)*..... *Not printed.*
- 123a.** Report of the Royal Commission on Life Insurance. Presented 26th February, 1907, by Hon. W. S. Fielding..... *Printed for both distribution and sessional papers.*

 CONTENTS OF VOLUME 13—*Continued.*

- 123b.** Supplementary return to 123a. Memorandum of exhibits by companies. Presented 6th March, by Hon. W. S. Filding. *Printed for both distribution and sessional papers.*
- 123c.** Supplementary Report of the Royal Commission on Life Insurance. *See No. 123b.*
- 123d.** Return to an address of the Senate dated 14th March, 1907, for the papers referred to as Exhibits Nos. 682, 686, 688, 737, 738, 740, and 741, in Sessional Paper No. 123b, being a supplementary return laid on the table of this house during the present session of parliament. Presented 4th April.—*Hon. Mr. Ferguson.* *See No. 123b.*
- 124.** Return to an address of the Senate, dated 16th January, 1907, showing: The tenders called for the supply of sleepers for any part whatsoever of the Transcontinental Railway by the Commissioners of the Transcontinental Railway. Who are the tenderers. What are the prices asked by each of them. Who obtained the contract. At what price and for what quantity. Has the contractor begun the execution of his contract. What quantity has he delivered up to this date. To whom, and at what place. What amount of money has he received in payment. Presented 24th January, 1907.—*Hon. Mr. Landru.* *Not printed.*
- 125.** Return to an order of the House of Commons, dated 18th December, 1906, for a copy of all correspondence between the five companies and the one individual whose hydraulic mining leases were cancelled during the past year, and the government, or any department thereof. Presented 29th January, 1907.—*Mr. Roche (Marquette).* *Not printed.*
- 126.** Return to an order of the House of Commons, dated 16th January, 1907, for a copy of all papers and correspondence during the past year in connection with the leasing of any lands adjacent to Lake Manitoba for sporting or other purposes. Presented 29th January, 1907.—*Mr. Schaffner.* *Not printed.*
- 127.** Return to an address of the House of Commons, dated 28th November, 1906, for a copy of all correspondence between the government of Canada and the government of Australia, or any officials thereof, with reference to tariff preferences between the two countries; and all orders in council in reference thereto, for the years 1904, 1905, 1906. Presented 29th January, 1907.—*Mr. Borden (Curleton)* *Not printed.*
- 128.** Return to an order of the House of Commons, dated 3rd December, 1906, showing the number of acres of Indian lands sold in each year since 1896, with the price received per acre, and where selected in each case; a statement of the manner in which said lands were sold in each case per acre, whether by public tender or private sale. If sold by tender, in how many papers were advertisements printed, in each case; also, giving the number of days from first appearance of such notice until tenders were closed, in each case; the amount paid the Indians, the expenses connected with the sales, and where the balance of these sales was deposited; also, a copy of all leases given by this government of Indian lands in the provinces of Manitoba, Saskatchewan, Alberta and British Columbia, since 1896; with a statement showing how such lands were leased, either by public tender or by private arrangement. Presented 29th January, 1907.—*Mr. Armstrong.*
Not printed.
- 129.** Return to an order of the House of Commons, dated 9th January, 1907, showing: 1. How many cheese curing buildings in all have been erected or provided by the government. 2. Where they are located. 3. The cost of each one, including care, and any other expense or expenses in connection therewith. 4. The charge, if any, made to the users of them. 5. What amount the government paid for transporting cheese from the factory to the curing rooms. The cost in connection with each factory, and the aggregate of all such costs up to date. 6. Who paid the charge for transportation from curing room when shipping; and if paid by the government, the aggregate of such costs to date. 7. The number of cheese manufacturers who have taken advantage of these curing rooms, and how many cheese have been stored by each, year by year, and the length of time each consignment has remained in the curing room. 8. The intention of the government to continue the use of these curing rooms for the future, or to extend them. 9. What disposition is to be made of those now owned by the government. Presented 1st February, 1907.—*Mr. Sproule.* *Not printed.*
- 130.** Return to an order of the House of Commons, dated 12th December, 1906, for a copy of all papers, and correspondence between the department of marine and fisheries and any person or persons, with reference to the sending of assistance and lifeboats to the relief of vessels recently wrecked on the north side of Prince Edward Island; and also papers and correspondence with reference to establishing life-saving stations and appliances at different points around the coast of Prince Edward Island. Presented 4th February, 1907.—*Mr. Lefurgey.* *Not printed.*

 CONTENTS OF VOLUME 13—*Continued.*

- 131.** Return to an order of the House of Commons, dated 3rd December, 1906, for a copy of all correspondence and documents on file referring to the sale of any timber upon what is known as the "Light House" reserve, on Hope Island, in the Georgian Bay. Presented 4th February, 1907.—*Mr. Bennett*..... *Not printed.*
- 132.** Copies of all correspondence between the Clerk of the Senate, and the Department of the Auditor General, and that of the Department of Justice, relating to the payment of sessional indemnity and travelling expenses to senators. Presented 1st February, 1907, by the Hon. The Speaker. *Not printed.*
- 133.** Pay and Allowances Regulations for the Canadian militia, to have effect from the 1st January, 1907. Presented 6th February, 1907, by Sir Frederick Borden..... *Not printed.*
- 134.** Return to an order of the House of Commons, dated 30th January, 1907, for a copy of all accounts, vouchers, correspondence, documents and papers relating to the purchase of supplies forwarded or intended to be forwarded to Kingston, Jamaica, for the relief or assistance of sufferers from the recent disaster in that city. Presented 6th February, 1907.—*Mr. Taylor*..... *Not printed.*
- 135.** Return to an address of the Senate, dated 23rd February, 1907, asking for the production before the house of all papers, orders, rules, charges, reports of inquiries, evidence, and judgment rendered, by any council of war or court-martial whatsoever, concerning a soldier of the ordnance corps by the name of Téléphore Roy, at Québec, accused and found guilty of any offence whatsoever, and sentenced on that account to cells and hard labour; together with all documents relating to this matter, before and after the charge and the judgment of the military court; the names of the complainant, of the officers who sat on the court-martial, of the defender of the accused, of those who confirmed the judgment; and a copy of the record upon which were based both the judgment of the court martial and the confirmation by superior authority of the judgment rendered. Presented 6th February, 1907.—*Hon. Mr. Landry*..... *Not printed.*
- 136.** Return to an address of the House of Commons, dated 10th December, 1906, for a copy of all orders in council, contracts, reports of experts or officials, and of all correspondence relating to the adoption and purchase of 250 subtarget guns, by the department of militia, and especially all letters passing between the Ontario Sub-Target Company (Limited), Mr. J. H. Jewell, Mr. Hartley Dewart, K.C., or any director or shareholder of the Sub-Target Company, and the Minister of Militia, or his private secretary, in reference to purchases or contracts, or agreements to purchase, either proposed or consummated, and payments made thereon or in pursuance thereof. Presented 7th February, 1907.—*Mr. Foster*..... *Not printed.*
- 136a.** Supplementary return to No. 136. Presented 20th March, 1907..... *Not printed.*
- 137.** Return to an address of the House of Commons, dated 30th January, 1907, for a copy of documents relating to the Metlakatla Indian Reserve, that is to say, a certain agreement with the province of Prince Edward Island in or about the year 1876, and mentioned in an order in council bearing date 2nd April, 1906, the said order in council and all recent correspondence dealing with the reserve. Presented 7th February, 1907.—*Mr. Borden (Carleton)*..... *Not printed.*
- 138.** Return to an address of the House of Commons, dated 28th November, 1906, for a copy of all orders in council, agreements, valuations, reports, memoranda, letters, telegrams, correspondence, documents and papers, in connection with the sale or grant by the government of Canada, or any department thereof, since 1st January, 1905, of any public lands or public domain, other than to actual settlers. Presented 7th February, 1907.—*Mr. Borden (Carleton)*..... *Not printed.*
- 139.** Return of the names of all persons appointed to or promoted in the Civil Service of Canada, during the calendar year 1906. Presented 14th February, 1907, by Sir Wilfrid Laurier..... *Not printed.*
- 140.** Return to an address of the House of Commons, dated 28th January, 1907, for a copy of all orders in council, rules or regulations governing the operation and management of the Government Printing Bureau. Presented 14th February, 1907.—*Mr. Verville*..... *Not printed.*
- 141.** Return to an order of the House of Commons, dated 3rd December, 1906, for a copy of all correspondence concerning the retirement from office of Mr. Talbot, late postmaster at Cannington, Ontario. Presented 14th February, 1907.—*Mr. Hughes (Victoria)*..... *Not printed.*
- 142.** Return to an order of the House of Commons, dated 30th January, 1907, showing what life-saving stations are maintained on the sea coasts and inland waters of Canada, when the same were erected, respectively, and at what cost, respectively, and the cost of maintenance of each of same, during the last ten years. Presented 14th February, 1907.—*Mr. Boyce*..... *Not printed.*

 CONTENTS OF VOLUME 13—*Continued.*

143. Return to an address of the House of Commons, dated 30th January, 1907, for a copy of all papers, memorials, memorandums, documents and correspondence between the provincial assembly and provincial government of Manitoba, and the Dominion Parliament and Dominion Government during the past ten years, in reference to the extension of the boundaries of Manitoba. Presented 18th February, 1907.—*Mr. Roche (Marquette)*... .. *Not printed.*
144. Despatches and orders in council relative to Colonial Conference, 1907, from 20th April, 1905, to 15th February, 1907. Presented 18th February, 1907, by Sir Wilfrid Laurier.
Printed for both distribution and sessional papers.
145. Return to an address of the House of Commons, dated 28th January, 1907, for a copy of all orders in council, letters, papers, correspondence and documents relating to or connected with the resignation of Mr. Alexander Henderson as judge of the county court of British Columbia. Presented 18th February, 1907.—*Mr. Borden (Carleton)*... .. *Not printed.*
146. Return to an order of the House of Commons, dated 6th February, 1907, showing the number of persons employed in the House of Commons, (a) as permanent employees, and in what capacity; (b) as sessional employees, and in what capacity; (c) the salary of each such employee; (d) the name of each employee of the house, or connected with the service of the house, as translators or otherwise, not living at Ottawa; (e) where each employee lives, and what his salary or remuneration is. Presented 18th February, 1907.—*Mr. Bergeron*... .. *Not printed.*
- 146a. Return to an order of the House of Commons, dated 6th February, 1907, showing where all the clerical work of the House of Commons is done, (a) the ordinary routine work; (b) all the translation; (c) how much is paid to translators not living in Ottawa, or working at their homes in Ottawa, per day, or how paid; (d) how much was paid last year for all such services in the House of Commons. Presented 18th February, 1907.—*Mr. Bergeron*... .. *Not printed.*
147. Copy of order in council respecting the landing of fresh fish in American bottoms and the purchase of supplies by such vessels, in ports of British Columbia,—and also copy of instructions to the collector of customs, Vancouver, B.C., respecting the same. Presented 19th February, 1907, by Hon. W. Paterson... .. *Not printed.*
148. Return to an address of the House of Commons, dated 6th February, 1907, for a copy of all orders in council, reports, letters, telegrams, accounts, vouchers, documents and other papers since the 1st January, 1902, relating to the surrender of the whole or any portion of the Nipissing Indian Reserve. Presented 20th February, 1907.—*Mr. Taylor*... .. *Not printed.*
149. Return to an address of the Senate, dated 29th of January, 1907, for copies of all reports received by the government or any member thereof, relating to the establishment of an experimental branch farm in Prince Edward Island, and any order in council made regarding the same; also a statement showing what tract of land, if any, has been purchased for the purposes of the said farm, where it is located, the number of acres acquired, the price paid for the same, and the name of the vendor. Presented 19th February, 1907.—*Hon. Mr. Ferguson*... .. *Not printed.*
150. Return (in so far as the department of the interior is concerned) to an address of the House of Commons, dated 6th February, 1907, for a copy of all orders in council in connection with the land grants or subsidies to the following railways: The Manitoba and Southeastern Railway Company, the Lake Manitoba Railway and Canal Company, the Hudson Bay Railway Company, the Winnipeg and Great Northern Railway Company, and all other railways now part of The Canadian Northern Railway Company's system, west of the province of Ontario. Presented 21st February, 1907.—*Mr. McCarthy (Calgary)*... .. *Not printed.*
151. Correspondence respecting the vacancy on the Bench of the Supreme Court of Nova Scotia. Presented 21st February, 1907, by Hon. A. B. Aylesworth... .. *Not printed.*
152. A statement of the affairs of the British Canadian Loan and Investment Company, as on 31st December, 1906. Presented 22nd February, 1907, by the Hon. The Speaker... .. *Not printed.*
153. Return to an order of the House of Commons, dated 6th February, 1907, showing: In respect of items "Locomotive and car shops, and land purchase at Moncton, \$540,000" and "New machinery for locomotive and car shops, \$72,500", in the Appropriation Act of 1906, Schedule B, page 29, all expenditures made thereunder up to December 31st, 1906, said statement to specify in respect of each payment, the date of the transaction, the nature of the goods supplied or service rendered, name of the person or company to whom the consideration was paid. Presented 25th February, 1907.—*Mr. Crockett*... .. *Not printed.*

 CONTENTS OF VOLUME 13—*Continued.*

- 154.** Return to an order of the House of Commons, dated 21st January, 1907, for a copy of all reports, papers, surveys, estimates, correspondence and other documents, with reference to the proposed branch line from the Prince Edward Island Railway at or near O'Leary, to a point at or near West Cape. Presented 25th February, 1907.—*Mr. Lefurgey*..... *Not printed.*
- 155.** Return to an order of the House of Commons, dated 3rd December, 1906, for a copy of all correspondence, contracts, appointments of overseers, in respect to Port Bruce Harbour, in the county of Elgin, Ontario, since 1st January, 1905; also a return showing voucher pay-sheets, amount of new material used, from whom purchased, of all day or contract work on said harbour, giving the names of overseers and when appointed, from same date. Presented 26th February, 1907.—*Mr. Marshall.*
Not printed.
- 156.** Return to an order of the House of Commons, dated 6th February, 1907, showing: 1. What government dredges operated in the maritime provinces during the years 1900-1, 1901-2, 1902-3, 1903-4, 1904-5, 1905-6. 2. At what ports or places in the maritime provinces dredging was carried on during said years, giving the name of the dredge operating in each place, the number of days each dredge was employed, and the number of cubic yards excavated at each place where dredging was carried on. 3. Where said dredges are at present. Presented 26th February, 1907.—*Mr. Sinclair.*
Not printed.
- 157.** Return to an address of the House of Commons, dated 28th November, 1906, for a copy of all orders in council, valuations, letters, telegrams, correspondence, memoranda, conveyances and other documents and papers, from the first day of January, 1900, to the present time, relating to the proposal to acquire lands at Truro, Nova Scotia, for the Intercolonial Railway, and especially all such documents as aforesaid relating to the acquisition of land purchased by the Crown from H. W. Yuill by deed bearing date on or about the 17th October, 1904; also a copy of conveyances bearing date in October, 1904, under which the said Yuill acquired the said property; also all reports touching the question of sites for the construction of a round-house at Truro. Presented 28th February, 1907.—*Mr. Borden (Carlton)*..... *Not printed.*
- 158.** Return to an order of the House of Commons, dated 11th February, 1907, showing: 1. What work the Railway Department ordered and performed at public expense to rail and ballast the whole or part of a branch railway from the Intercolonial Railway to the Wallace Quarries, Cumberland County, Nova Scotia, and what length was railed or ballasted. 2. From what point and for what distance the department conveyed ballast for the said work. 3. The length of said branch line. 4. Why the said branch line was not extended to Wallace Village, and what distance farther than constructed it would be necessary to build to give Wallace Village rail connection. 5. If the department hauls cars to said Wallace Quarries at public expense, and why it is done. 6. If shunting charge on the said branch line was cancelled, when it was cancelled, and for what reason. 7. At whose instance or request, or for whose benefit the above-mentioned work was done, and the shunting charge cancelled. 8. How much the department has expended for work on construction of said branch line. 9. Who the owners or operators of the said Wallace Quarries are. 10. What the freight rates collected by the department over the said branch lines are. 11. What similar or any concessions in the matter of construction, reduction of freight rates, or cancellation of shunting charges, to or in relation to any other quarries operated at or near Wallace have been granted by the department. 12. What other quarries operating at or near Wallace, and doing business over the Intercolonial Railway, are charged freight rates or shunting charges, or both, upon or in respect to any branch line used by them. 13. What companies are so operating, and what charges the department makes against them. 14. What owners or operators of the Wallace Quarries above-mentioned are related to the minister of railways, who they are, and how related. Presented 28th February, 1907.—*Mr. McLean (Queen's)*..... *Not printed.*
- 159.** Return to an order of the House of Commons, dated 18th February, 1907, showing: Summary of stock, implements, chattels, grain, hay, roots, and all other kinds of fodder, and their value, on the first day of December, for the years 1905-1906 on the Central Experimental Farm, Ottawa. Presented 28th February, 1907.—*Mr. Jackson (Elgin)*..... *Not printed.*
- 160.** Return to an order of the House of Commons, dated 10th December, 1906, for a copy of the correspondence, telegrams, tenders, and engineer's estimate, in reference to letting the contract for the construction of extension pier at Port Daniel, in county of Bonaventure, on 30th May, 1904. Presented 1st March, 1907.—*Mr. Martin (Queen's)*..... *Not printed.*

 CONTENTS OF VOLUME 13—*Continued.*

161. Return to an order of the House of Commons, dated 3rd December, 1906, for a copy of all correspondence, contracts, appointments of overseers, in respect to Port Burwell Harbour, in the county of Elgin, Ontario, since 1st January, 1905; also a return showing pay-sheets, amount of new material used, from whom purchased, of all day or contract work on said harbour, giving names of overseers, and when appointed from the same date. Presented 1st March, 1907.—*Mr. Marshall.*
Not printed.
162. Copy of Deed, Joseph H. Henderson *et al* to His Majesty the King, for 34.78 acres of land in the city of Halifax, N.S., for the Intercolonial Railway. Presented 1st March, 1907, by Hon. H. R. Emmerson..... *Not printed.*
163. Return to an order of the House of Commons, dated 3rd December, 1906, showing: 1. The present indebtedness to the Dominion Government of the Montreal Turnpike Trust, (a) on capital account; (b) for arrears of interest. 2. The amount collected at each toll-gate belonging to the said Turnpike Trust during the year ending 31st December, 1905. 3. The names of all parties who have commuted their tolls, and the amount of commutation paid in each case. 4. The amounts expended on each section or road division under the control of said trust, during the said year, ending 31st December, 1905, and the contracts given out during the year, with the name of the contractor, and the date and amount involved in each case. 5. The amount paid out during the said year at each toll-gate and check-gate for salaries of day and night keepers, and other expenditures at each of the toll-gates maintained. 6. The names of all parties holding passes for free use of the road, under the control of said trust, during the said year. 7. The expense of the said trust during the said year, for rent, salaries of the office, giving name and remuneration of each official. 8. The actual indebtedness in detail of the said trust, outside of its bonds, due to the government of Canada. 9. The amount collected during the year 1905 from municipalities, under special agreements made, as their share, pro rata, of the bonded indebtedness of the Turnpike Trust. Presented 1st March, 1907.—*Mr. Monk.*..... *Not printed.*
164. Return to an order of the House of Commons, dated 16th January, 1907, showing: 1. What amounts were paid into the office of the receiver general during the fiscal year 1905-1906 on account of contractors' deposits for security, and by what contractors these sums were paid. 2. The deposits forfeited to the government during the said fiscal year, names of the contractors and the amounts so forfeited. 3. Cheques received as security from contractors during the said fiscal year, held by the departments which received them, and from whom they were received. 4. The total amount now in the hands of the receiver general and of the several departments, respectively, belonging to this account. Presented 1st March, 1907.—*Mr. Foster.*..... *Not printed.*
165. Return to an address of the House of Commons, dated 10th December 1906, (in so far as the department of customs is concerned), for a copy of all orders in council, correspondence, and all other papers, relating to the Standard Chemical Company (Limited), or Peuchen & Co., in its dealings with the Customs and Inland Revenue Departments, from the date of the incorporation of the said company to the present date. Presented 1st March, 1907.—*Mr. Robitaille.*..... *Not printed.*
166. Return (in so far as the department of the interior is concerned) to an address of the Senate dated 7th February, 1907, calling for the orders in council of the 11th of May, 1885, and the 5th of March, 1895, allotting lands in the Northwest Territories under the authority of the Act of 1884, chapter 25, section 7, and all orders in council passed since 1895, relating to grants of lands for this purpose. Also copies of all contracts between the Canadian Northern Railway Company and the government relating to the construction of a line of railway to the Hudson Bay or any portion of the said line of railway. Presented 21st February, 1907.—*Hon. Mr. Ferguson.*..... *Not printed.*
167. Return to an order of the House of Commons, dated 9th January 1907, showing all timber lands in the railway belt in the province of British Columbia, sold or leased by the government, or any department thereof, since the 1st July, 1896, the description and area of such lots, the applications made therefor, the notice of advertisement for sale or tender, the tenders received, the amount of each tender, the tenders accepted, the name and address of the person or company to whom each lot was sold or leased. Presented 4th March, 1907.—*Mr. McCarthy (Calgary).*..... *Not printed.*
- 167a. Return to an order of the House of Commons, dated 11th March, 1907, showing: The timber lands sold or leased by the department of the interior subsequent to the date of those included in Sessional Paper No. 90, brought down to the house on the 9th of April, 1906; the description and area of such lands, the applications made therefor, the notice of advertisement for sale or tender, the tenders received, the amount of each tender, the tenders accepted, the name of the person or com-

 CONTENTS OF VOLUME 13—*Continued.*

- pany to whom each lot was sold or leased, and the name and address of each person or company to whom any of such leases have been transferred. Presented 9th April, 1907.—*Mr. Ames. Not printed.*
- 167b.** Return to an order of the House of Commons, dated 8th April, 1907, showing, in respect of timber berths Nos. 824, 1062, 1107, 1108, 1171 and 1212, all bonuses, rentals or dues paid to date by the lessees or other assigns to the government, together with a copy of all applications, correspondence, reports, advertisements, tenders, leases, transfers, or memoranda of any description, and a copy of the regulations of the department of the interior in force at the time said timber berths were leased, and the corresponding regulations in force at the present time. Presented 26th April, 1907.—*Mr. Boyce Not printed.*
- 168.** Return to an order of the House of Commons, dated 4th March, 1907, showing: 1. How much money has been paid by the government of Canada in the form of bounties on lead. 2. To what companies the same has been paid. 3. Where the mines are located. Presented 4th March, 1907.—*Mr. Marshall Not printed.*
- 169.** Return to an address of the House of Commons, dated 11th February, 1907, for a copy of all correspondence, reports and letters, between this government and the government of the United States, relating to rural free delivery. Presented 5th March, 1907.—*Mr. Armstrong Not printed.*
- 170.** Return to an order of the House of Commons, dated 11th February, 1907, showing the names of the employees of the Brandon Post Office during the year ending June 30th, 1906, and salaries received by them, respectively; also names and salaries of those now employed in the office; also amount paid by the postmaster for help and expenses for year ending June 30th, 1906. Presented 5th March, 1907.—*Mr. Roche (Marquette) Not printed.*
- 71.** Return to an order of the House of Commons, dated 3rd December, 1906, for a copy of all correspondence, contracts, appointments of overseers, in respect to Port Stanley Harbour, in the county of Elgin, Ontario, since 1st January, 1905; also a return showing pay-sheets, amount of new material used, from whom purchased, of all day or contract work on said harbour, giving names of overseers, and when appointed from the same date. Presented 5th March, 1907.—*Mr. Marshall. Not printed.*
- 172.** Return to an order of the House of Commons, dated 28th January, 1907, showing: In respect of the special inspection undertaken in April last of all unpatented homesteads entered for prior to 1st September, 1905, in the Alameda, Battleford, Regina and Yorkton land districts (referred to in Part I, page 4, of the Report of the Department of the Interior, 1905-6: (a) the report of the Inspector of Dominion Land Agencies; (b) the instructions issued to the several land agents and homestead inspectors; (c) all correspondence between the department of the interior and the aforesaid agencies in respect to the necessity or desirability of such inspection, the manner in which it should be conducted, and the action to be taken in consequence of the facts brought out by such inspection. Presented 6th March, 1907.—*Mr. Ames Not printed.*
- 173.** Return to an address of the Senate, dated 13th June, 1906, for a copy of the correspondence exchanged between the Honourable Mr. Landry and the Right Honourable Sir Wilfrid Laurier, and between the latter and the Department of Militia and Defence, on the subject of the refusal by that department to translate and to cause to be published in French the regulations for the militia which were published, in English only, in the *Canada Gazette*, of the 5th May last. Presented 5th March, 1907.—*Hon. Mr. Landry Not printed.*
- 174.** Return to an order of the House of Commons, dated 18th February, 1907, for a copy of all regulations submitted by the government to trans-Atlantic steamship companies for their guidance in regard to stowing of perishable products, or temperatures to be maintained in cold storage, or cold air chambers, or ventilation required in ordinary storage chambers on their steamships. Presented 7th March, 1907.—*Mr. Smith (Wentworth) Not printed.*
- 175.** Return to an order of the House of Commons, dated 23rd January, 1907, for a copy of all correspondence and written communications between judges of the Provincial Courts and the Minister of Justice, or any member or official of the government, since the passing of the Dominion Act 4-5 Edward VII, chapter 31, in reference to section 7 of said Act, or in reference to judges acting as executors, administrators or trustees of estates, directors or managers of companies, corporations or firms, or arbitrators, umpires or referees in matters of controversy, or engaging in other extrajudicial work; and including a copy of a circular letter to judges issued by the Minister of Justice, and referred to by the Minister in *Hansard* for First Session of 1906, at page 869, and of the answers of the judges to the circular. Presented 8th March, 1907.—*Mr. Lennox Not printed.*

 CONTENTS OF VOLUME 13—*Continued.*

176. Return to an order of the House of Commons, dated 28th January, 1907, for a copy of the report of Mr. C. W. Speers, General Colonization Agent, in respect of the special inspection and enumeration which was made of the Doukhobor colonies during the year 1905-6, together with the instructions which led up to it, and the report of the inspectors engaged in the work (without census sheets), and any correspondence in connection with or arising out of the same. Presented 8th March, 1907.—*Mr. Ames*..... *Not printed.*
177. Return to an order of the House of Commons, dated 28th February, 1907, for a copy of all correspondence in regard to the mission of W. L. Mackenzie King, Deputy Minister of Labour, to England, to secure legislation by the British Parliament to prevent fraudulent representations being made in that country to induce emigration to Canada; also a copy of the legislation enacted as a result of such mission. Presented 8th March, 1907.—*Mr. Smith (Nanaimo)*..... *Not printed.*
178. Return to an order of the House of Commons, dated 18th February, 1907, for a copy of the report respecting the selection and location of 3,500,000 acres in the Peace River District of British Columbia, which has been prepared upon the exploratory survey mentioned by the Minister of the Interior on the 7th February in the House of Commons. Presented 11th March, 1907.—*Mr. Borden (Carlton)*..... *Printed for sessional papers.*
179. Return to an order of the House of Commons, dated 20th February, 1907, showing all timber licenses over Indian lands in the territorial district of Algoma granted or rented by the government since 1896; returns of such licenses or rentals, the area covered by each of the same, the names and address of the several licensees, and the prices or rentals paid, respectively, and any conditions which may be attached to the same, respectively. Presented 12th March, 1907.—*Mr. Boyce*..... *Not printed.*
180. Return to an order of the House of Commons, dated 25th February, 1907, for a copy of all correspondence, documents and papers, accounts, agreements, grants and memoranda respecting the application for and sale of timber lands in the townships of Fisher, Haviland and Tilley, in the district of Algoma, on the 21st of November, 1900, by the Superintendent General of Indian Affairs, to Messrs. Wilson, Reeser and Philp. Presented 12th March, 1907.—*Mr. Boyce*..... *Not printed.*
181. Return to an order of the House of Commons, dated 10th December, 1906, for a copy of all reports made by superintendents of experimental farms in Canada regarding the results of experiments made during the past season to test the value of fish scrap produced at the government reduction works at Canso, Nova Scotia, as a fertilizer. Presented 12th March, 1907.—*Mr. Sinclair*..... *Not printed.*
182. Return to an order of the House of Commons, dated 25th February, 1907, showing what statistical matter has been omitted from the Canada Year-book, 1905, which it has been customary to include in the Year-book of former years; and also where such omitted information can be found if published elsewhere. Presented 12th March, 1907.—*Mr. Kemp*..... *Not printed.*
183. Return to an order of the House of Commons, dated 11th February, 1907, showing: 1. What control the government has over the teachers in the Indian schools of Canada. 2. Whether or not the teachers are compelled by law to have certificates before accepting a position in the Indian schools of Canada. 3. How many teachers in the Indian schools of Canada have first class certificates, how many second class certificates, how many third class certificates, and how many are teaching on permits. 4. What standard of school books are used in said schools, and if said books are issued under instructions, from the department of Indian affairs, or issued by the department, or by what authority said books are issued, and who has charge of the issuing of such books. 5. Any regulations relating to education of Indians passed by this government since 1896, and the nature of said regulations. 6. The regulations, if any, that have been passed since 1896 relating to teachers in Indian schools. Presented 13th March, 1907.—*Mr. Armstrong*..... *Not printed.*
184. Return to an order of the House of Commons, dated 25th February, 1907, for a copy of all correspondence had between the Attorney General of New Brunswick, or any other member of the New Brunswick government, and the Minister of Justice, or any other member of the Dominion government, touching or in any way relating to the reorganization of the Supreme Court of New Brunswick. Presented 13th March, 1907.—*Mr. Crocket*..... *Not printed.*
185. Return to an order of the House of Commons, dated 20th February, 1907, showing: 1. The names of every officer, non-commissioned officer and man, of the Second Rifles Royal Canadian Regiment, the Canadian Mounted Rifles, the Royal Canadian Field Artillery, and the Strathcona Horse, and the South African Constabulary, who enlisted from the province of British Columbia, in order to take part in active military operations in South Africa. 2. The names of all British Columbians

CONTENTS OF VOLUME 13—*Continued.*

- who served with or embarked for service with the British forces in South Africa who were not members of the above corps. 3. The names of all British Columbians who were regularly appointed to the medical staff, and were actively engaged in said military operations. 4. The names of nurses, hospital dressers, and orderlies, resident in British Columbia, who were actively engaged in said military operations. Presented 13th March, 1907.—*Mr. Ross (Yale-Cariboo)*... ..*Not printed.*
- 186.** Return to an order of the House of Commons, dated 23rd January, 1907, for a copy of all correspondence, with the papers and reports made by superior officers of the Department of Marine and Fisheries, or by Captain Wakeham, or any other person, regarding the dismissal from the service of R. P. Dubé, second mate on board *La Canadienne*; also for a copy of the report made by the said R. P. Dubé to the Department of Marine and Fisheries regarding the fire on the *Aberdeen*, on the 10th November, 1905. Presented 13th March, 1907.—*Mr. Gauvreau*... ..*Not printed.*
- 187.** Return to an order of the House of Commons, dated 11th February, 1907, for a copy of the record and all proceedings in the suit in the Exchequer Court of Canada between the King, on the information of the Attorney General of the Dominion of Canada, and H. E. Lyon, plaintiffs, and Malcolm McKenzie and Felix A. Montalbetti, defendants, including all correspondence in connection therewith between the Department of Justice and the Department of the Interior, or any officers thereof, respectively, and between either of the said departments, or any officers thereof, and any other person or persons whatsoever; and including all documents or memorandum in any way relating to the said suit, including instructions to counsel engaged therein on behalf of the plaintiffs; and also all documents on file in the Department of the Interior, relating to the northeast quarter of section 35, in township 7, range 4, west of the 5th meridian. Presented 18th March, 1907.—*Mr. Herron*... ..*Not printed.*
- 187a.** Supplementary return to No. 187. Presented 10th April, 1907... ..*Not printed.*
- 188.** Return to an order of the House of Commons, dated 23rd January, 1907, showing: All sales of Dominion lands of 160 acres and upwards, in Manitoba, Saskatchewan and Alberta, which have been made by the government, exclusive of school lands, since the 1st January, 1905, with the price obtained, and dates of sale. Presented 19th March, 1907.—*Mr. Lake*... ..*Not printed.*
- 189.** Return to an address of the Senate, dated 6th March, 1907, for copies of all correspondence between the government of Canada or any member thereof with any person whatsoever, and any report from any officer of the government regarding the question of pensions by the state to deserving persons of advanced age; and also a copy of a Bill referred to by the Right Honourable the Minister of Trade and Commerce during a speech made by him in the Senate on the 28th February last, dealing with the sale of annuities by the government of Canada. Presented 19th March, 1907.—*Hon. Mr. Ferguson*... ..*Not printed.*
- 190.** A statement in pursuance of section 17 of the Civil Service Insurance Act for the year ending 30th June, 1906. Presented (Senate) 15th March, 1907, by Hon. R. W. Scott... ..*Not printed.*
- 191.** Return to an address of the House of Commons, dated 28th March, 1906, for copies of all orders in council, reports, memoranda, correspondence, valuation, documents and papers, of every kind and nature and description, relating to the property situated on the south side of Spring Garden Road, in the city of Halifax, upon which the old drill shed was or is situated; or relating to the leasing, conveying, disposal, or user of the said property, or of any property conveyed to the crown in consideration or in part consideration therefor. Presented 22nd March, 1907.—*Mr. Fowler*... ..*Not printed.*
- 192.** Return to an order of the House of Commons, dated 11th February, 1907, for a copy of all reports or correspondence between the Railway Commission and the Department of Justice, concerning the trial of one Atkinson, on a charge of manslaughter, in connection with the collision which took place on the Grand Trunk Railway at Richmond, Quebec, in August, 1904. Presented 22nd March, 1907.—*Mr. Worthington*... ..*Not printed.*
- 193.** Return to an order of the House of Commons, dated 6th February, 1907, for a copy of all correspondence, telegrams, orders in council, and all other papers and documents in possession of the government, or any member or official thereof, in any way relating to the purchase by the government of what is known as the Warburton property in Charlottetown, for a rifle range, and a right of way for approach to the Hillsboro' bridge. Presented 25th March, 1907.—*Mr. Lefurgey*... ..*Not printed.*
- 193a.** Supplementary return to No. 193. Presented 15th April, 1907... ..*Not printed.*

 CONTENTS OF VOLUME 13—*Continued.*

- 194.** Return to an address of the House of Commons, dated 17th December, 1906, for a copy of all orders in council, advertisements for tenders, tenders, specifications of every kind, plans, drawings, reports, letters, telegrams, correspondence, contracts, agreements and other documents and papers of every kind, touching or relating to the construction of immigration buildings in the city of Winnipeg, since 1st January, 1900. Presented 25th March, 1907.—*Mr. Borden (Carleton).*
Not printed.
- 194a.** Supplementary return to 194. Presented 19th April, 1907..... *Not printed.*
- 195.** Return to an order of the House of Commons, dated 4th March, 1907, showing: The number of desks of every kind and description, with prices of the same, bought for the House of Commons by the government, since 1896. (Particulars of purchases by Stationery Branch and the Sergeant-at-Arms.) Presented 25th March, 1907.—*Mr. Bergcron.*..... *Not printed.*
- 196.** Return to an order of the House of Commons, dated 4th March, 1907, showing: 1. The chief differences in principle between the Ross rifle and the Snider-Enfield, the Martini-Henry and the Lee-Enfield. 2. The average annual number of each, the Ross rifle and the Lee-Enfield rifle, manufactured. 3. The various kinds of rifle "sights" for which adoption has been sought in recent years. 4. The number of accidents to men in Canada from each, the Lee-Enfield and the Ross rifle. 5. The break-ages or disabled rifles of each class recorded. Presented 25th March, 1907.—*Mr. Hughes (Victoria).*
Not printed.
- 197.** Return to an address of the House of Commons, dated 17th December, 1906, for a copy of all orders in council, advertisements for tenders, tenders, specifications, plans and drawings, reports, letters, telegrams, correspondence, contracts and other documents and papers of every kind, touching or relating to the construction of a post office building at Vancouver, British Columbia. Presented 27th March, 1907.—*Mr. Borden (Carleton)*..... *Not printed.*
- 198.** Return to an order of the House of Commons, dated 11th February, 1907, for a copy of all letters, reports and other papers connected with the cutting of a channel into a lake at Red Head, Shelburne Co., N.S., for the purpose of connecting it with the sea. Presented 2nd April, 1907.—*Mr. Gunn.*
Not printed.
- 199.** Return to an order of the House of Commons, dated 14th January, 1907, showing: The number of miles of government telegraph lines, respectively, in each of the provinces and districts of Canada, the points between which they run, and the various stations on each line, and population of the same, the working expenses and receipts, respectively of each station and line for the ten years ending December 31st, 1906; the amount that has been spent yearly during the ten past years, (a) on construction of new lines or extensions; (b) on repairs and maintenance of existing lines; and the total expenditure for, (a) construction; (b) repairs and maintenance of the present government telegraph lines, and the receipts and working expenses thereof by years. Presented 27th April, 1907.—*Mr. Foster.*..... *Not printed.*
- 200.** Return to an address of the House of Commons, dated 28th March, 1906, showing: 1. What proprietary rights, or rights of licensing, or control or other rights, if any, are vested in the government of Canada or the crown, in the right of Canada in respect to (a) sea fisheries; (b) inland fisheries in each province. 2. What such rights are vested in each provincial government or the crown in the right of each provincial government, in respect of the matter aforesaid. 3. What rights, powers or jurisdiction to lease or otherwise regulate or control, manage or interfere with sea or inland fisheries, are exercised by the federal government or any department thereof. 4. What such rights, powers or jurisdiction, if any, are exercised by any provincial government or department thereof. 5. What jurisdiction to legislate is possessed or exercised by, (a) the parliament of Canada; (b) any provincial legislature with respect to: (c) sea fisheries, or (d) inland fisheries in regard to: (e) proprietary rights; (f) licensing; (g) other regulations; (h) control or management. 6. Whether any differences or disputes between any provincial government and the federal government now exist with respect to any of the matters above mentioned; and, if so, a statement of the exact nature and form of such disputes or differences. Presented 10th April, 1907.—*Mr. Borden (Carleton).*.... *Not printed.*
- 201.** Copy of amendment to the Postal Convention of January, 1888, between Canada and the United States. Presented 11th April, 1907, by Hon. R. Lemieux..... *Not printed.*
- 202.** Return to an order of the House of Commons, dated 18th February, 1907, for a copy of all correspondence, telegrams, reports, and all other information in the possession of the government, or any member or official thereof, in reference to winter communication, and the construction of a tunnel between Prince Edward Island and the mainland of Canada. Presented 12th April, 1907.—*Mr. Martin (Queen's).*..... *Not printed.*

 CONTENTS OF VOLUME 13—*Continued.*

- 202a.** Supplementary return to 202. Presented 17th April, 1907.....*Not printed.*
- 203.** Return to an order of the House of Commons, dated 30th January, 1907, showing what wrecks have been reported to the Department of Marine and Fisheries of Canada, which have occurred on the Great Lakes, that is, Lakes Huron and Superior, since the first day of May, 1882; showing what loss of life occurred as a consequence of each wreck, the reported or ascertained cause of the wreck, showing in each case whether there was an investigation into the cause of the wreck, the tonnage and approximate value of each vessel and cargo lost. Presented 12th April, 1907.—*Mr. Boyce.*
Not printed.
- 204.** Return to an order of the House of Commons, dated 3rd December, 1906, for a copy of all correspondence between the postmaster general's department and any person or persons, relating to the forbidding the use of the mails to the newspaper known as *Lowrey's Claim*, and copies of the articles complained of. Presented 15th April, 1907.—*Mr. Galliher*..... *Not printed.*
- 205.** Return to an order of the House of Commons, dated 29th November, 1906, showing the names, places of residence, places or ports where shipped, and dates when shipped, of the officers and crews of the steamers *Minto*, *Stanley* and *Princess*; and also of the dredges *W. S. Fielding*, *St. Lawrence* and *George MacKenzie*. Presented 12th April, 1907.—*Mr. McLean (Queen's)*.....*Not printed.*
- 205a.** Return to an address of the Senate dated 27th February, 1907, asking for a statement showing: 1. How many men are now or have been employed on the government steamer *Montcalm*, giving the name of each, the date of his employment, the nature of his duties, the amount of his remuneration, and stating in each case whether the employment has been permanent or temporary. 2. What service or services has the said steamer been engaged in, since her construction. If there have been different services the statement to show definitely the time devoted to each service. 3. At what places in the St. Lawrence or elsewhere has the said steamer operated in ice-breaking, and to what extent has such operation resulted in opening passages for ordinary shipping. 4. What has been the total cost of maintenance of said steamer, including wages, fuel, repairs, board of crew, and other expenses, from the time she commenced service (the date to be stated) up to the 25th instant. 5. And showing the tonnage, horse-power, and original cost of said steamer. Presented 17th April, 1907.—*Hon. Mr. Ferguson*.....*Not printed.*
- 206.** Return to an order of the House of Commons, dated 17th December, 1906, for a copy of all correspondence between the Winnipeg Board of Trade and any other body or individual and the government or any department thereof, relating to the restriction of fishing on Lake Winnipeg. Presented 12th April, 1907.—*Mr. Roche (Marquette)*.....*Not printed.*
- 207.** Return to an order of the House of Commons, dated 17th December, 1906, for: 1. A copy of all leases and agreements between the government, represented by the Department of Marine and Fisheries, and (a) the Athabasca Fish Company (J. K. McKenzie, Selkirk, Manitoba), or their assigns, Messrs. Butterfield & Dee; (b) A. McNee, Windsor, Ontario; (c) the British American Fish Corporation of Montreal and Selkirk (F. H. Markey). 2. A copy of all reports, correspondence or documents, relating to or touching upon the application for securing of, transfer of, or enjoyment of any privileges under said leases. 3. A statement of all rentals, bonuses, or payments to the government in respect of such leases to date. 4. All information in the possession of or procurable by the government with reference to (a) the number of tugs, boats and men employed; (b) the quantity and value of nets used; (c) the number and value of fish taken; (d) the quantity of fish exported under each of said leases during the last period of twelve months, for which such figures are available. Presented 12th April, 1907.—*Mr. Ames*.....*Not printed.*
- 208.** Return to an order of the House of Commons, dated 9th January, 1907, showing, in respect of all contracts since 1st January, 1904, between the government and the Gallena Oil Company, of Toronto, for supplies to any of the railways of the government: 1. The tenders upon which contracts were based, and all tenders made by other parties for such contracts. 2. All correspondence and communications of the department and officers thereof, with theseveral tenderers or contractors, relating to such contracts, or tenders or supplies; also all correspondence and communications between such officers, relating to such tenders, contracts or supplies. 3. All advertisements, notices, statements, accounts, papers and vouchers, relating to such contracts or supplies, or payments thereof. Presented 15th April, 1907.—*Mr. Ames*..... *Not printed.*
- 209.** Return to an order of the House of Commons, dated 9th January, 1907, for a copy of all reports, instructions, plans, agreements or documents, of every description, in the possession of the government, concerning, relating to, or touching upon the location, the erection, or the equipment of new

CONTENTS OF VOLUME 13—*Continued.*

- locomotive and car shops at Moncton, or the purchase of new machinery for the same. Presented 15th April, 1907.—*Mr. Ames*..... *Not printed.*
210. Return to an order of the House of Commons, dated 11th of March, 1907, showing the total amount of money in banks, to the credit of the government, at the end of each month during the year 1906, and the name of each bank. Presented 15th April, 1907.—*Mr. Armstrong*..... *Not printed.*
211. Return to an order of the House of Commons, dated 20th February, 1907, showing all the mineral, coal and other lands, water-powers, and other franchises in the vicinity of Grand Falls, on the Hamilton River, and also in the District of Mackenzie; and also in the Territory of Ungava, that have been applied for, leased, granted, disposed of, or otherwise dealt with, since the year 1896; together with the names and addresses of the applicants, lessees and purchasers, the prices paid, the quantity of land alienated, and the conditions, if any, attached to each of the grants or dispositions. Presented 17th April, 1907.—*Mr. Boyce*..... *Not printed.*
212. Return to an order of the House of Commons, dated 11th March, 1907, for a copy of all papers, reports and correspondence, in connection with the Doukhobor colonies in Saskatchewan, from October 1st, 1906, to date. Presented 17th April, 1907.—*Mr. Cash*..... *Not printed.*
213. Return to an address of the House of Commons, dated 8th April, 1907, for a copy of all memorials, petitions, resolutions, correspondence or documents of any description in the possession of the government, relating to or referring to the recent appointment of a senator to represent the district of Rougemont. Presented 17th April, 1907.—*Mr. Ames*..... *Not printed.*
214. Return to an order of the House of Commons, dated 11th February, 1907, showing: 1. What works of a public nature have been undertaken in the counties of Compton, Richmond and Sherbrooke, respectively, by any department of this government since 1896 to date. 2. All sums of money, apart from the usual expenditure in connection with the maintenance of postal and customs department, that have been expended in these counties, respectively, since that date. 3. For what purposes these sums were expended, and to whom paid. Presented 19th April, 1907.—*Mr. Worthington*.
Not printed.
215. Return to an address of the House of Commons, dated 18th December, 1906, for a copy of all orders in council, advertisements for tenders, tenders, specifications of every kind, plans, drawings, reports, letters, telegrams, correspondence, contracts, agreements and other documents and papers of every kind, touching or relating to the construction of a post office in the city of Winnipeg, since the year 1900. Presented 19th April, 1907.—*Mr. Borden (Carleton)*..... *Not printed.*
216. Return to an order of the House of Commons, dated 11th February, 1907, for a copy of all letters, reports and other papers connected with the building of a wharf at North East Harbour, Shelburne County, N.S. Presented 19th April, 1907.—*Mr. Perley*..... *Not printed.*
217. Return (in part) to an order of the House of Commons, dated 6th February, 1907, for a copy of all letters, accounts, vouchers, cheques, correspondence and documents relating to any amount paid to Mr. R. T. McIlreith, barrister, of Halifax, for legal services, by the government of Canada, during each of the fiscal years ending, respectively, 30th day of June, 1902, 1903, 1904, 1905 and 1906. Also relating to all amounts similarly paid to any legal agent or representative of the government at Halifax during each of the fiscal years ending, respectively, 30th June, 1891, 1892, 1893, 1894, 1895, 1896 and 1897. Presented 19th April, 1907.—*Messrs. Crockett and Johnston*..... *Not printed.*
218. Return to an order of the House of Commons, dated 10th December, 1906, for a copy of all papers and correspondence, relating to the adoption and the application of section 9 of the Act of 1885, amending the Consolidated Revenue Act of 1883, now subsection 4 of section 148, of chapter 34 of the Revised Statutes of Canada; this Act treating of two-year maturing spirits in bond. Presented 19th April, 1907.—*Mr. Robitaille*..... *Not printed.*
219. Report of Mr. Augustus Power, K.C., Commissioner appointed to report on the matter of Louise F. Wiley vs. Fred. T. Congdon. Presented 19th April, 1907, by Hon. F. Oliver..... *Not printed.*
220. Extracts from a report of the Committee of the Privy Council, approved by the Governor General on 26th May, 1906, and 5th July, 1906, respecting certain ordinances passed by the council of the Yukon Territory. Presented 20th April, 1907, by Hon. F. Oliver..... *Not printed.*
221. Return to an order of the House of Commons, dated 4th March, 1907, showing: All coal lands leased, sold, or otherwise disposed of, from the 1st of January, 1906, to date, giving the area disposed of, the party to whom, the consideration therefor, the assignments made, if any, the date thereof, and the name of the assignee in each case. Presented 24th April, 1907.—*Mr. Lake*.
Not printed.

 CONTENTS OF VOLUME 13—*Concluded.*

- 222.** Census of Statistics. Bulletin 1, Wage-earners by Occupations. Presented 25th April, 1907, by Hon. S. A. Fisher *Not printed.*
- 223.** Return to an address of the Senate dated 7th December, 1906, for copies of all correspondence respecting a site or sites for a public building in the town of Glace Bay, N.S., between any member of the government and all other parties; the area of the sites, the price of each, the date of the purchase, the date of each payment, the name of the seller of each site, the report or reports of the government engineer, showing lots recommended and those not recommended by him, and all notes or memoranda referring to said sites. Presented 15th April, 1907.—*Hon. Mr. McDonald (Cape Breton)*. *Not printed.*
- 224.** Return to an order of the House of Commons, dated 28th November, 1906, for a copy of all correspondence and other papers since the year 1896, between the city of Toronto, the Harbour Commissioners of Toronto, or any other persons, and the Dominion government, relating to, (a) the dredging or deepening of Toronto Harbour and the approaches thereto at the eastern and western gaps, or the shoals outside of said entrances; (b) the building of breakwaters, piers or other works for or in connection with such entrances at the eastern and western gaps to said harbour. Presented 27th April, 1907.—*Mr. Macdonnell*. *Not printed.*
- 225.** Supplementary return to 166. Presented (Senate) 28th February, 1907 *Not printed.*
- 226.** Return to an address of the Senate dated 20th March, 1907, asking for all correspondence between the government of Canada or any department thereof, and the government of Prince Edward Island, in 1901 or 1902, respecting the per capita allowance payable to that province, as provided for in the British North America Act, and how the said allowance should be computed on the population of the province, as ascertained by the census of 1901. Presented 5th April, 1907.—*Hon. Mr. Ferguson*. *Not printed.*
- 227.** Return to an order of the Senate, dated 6th February, 1907, asking for a statement indicating in so many columns: 1. The names, christian names, age and nationality, of all persons who have been appointed to any position in the customs house at Quebec, since the 1st of July, 1906. 2. The names of the persons who were replaced by those new appointments, specifying at the same time whether the persons so replaced were replaced by reason of their death, their retirement, or their dismissal, and by whom they have been replaced. 3. The names of the persons who recommended each of these new appointments. Presented 27th April, 1907.—*Hon. Mr. Landry*. *Not printed.*

REPORT

OF THE

DEPUTY MINISTER OF MARINE AND FISHERIES.

To the Honourable LOUIS-PHILIPPE BRODEUR,
Minister of Marine and Fisheries.

SIR,—I have the honour to report on the transactions of the Marine Branch of this department for the fiscal year ended June 30, last, and to give an account of a portion of the work since that date.

The demand for increased aids to navigation have continued, and as far as possible, new aids have been established and improvements made in many instances to the aids formerly existing. The result on the whole has therefore been a reduction of the dangers to navigation in the waters of the Dominion.

The re-arrangement of the different branches made the year previous, was found to lead to a more effective carrying out of the work of the department. The experience gained in the past year, in all branches of the service, has been valuable in demonstrating the success of the methods in use and showing where improvements can still be made. The detailed work connected with carrying out the policy of the department has vastly increased, making it necessary to increase the staff of officers and employees inside and outside.

The maintenance of the work in the ship channel in the St. Lawrence river and the government shipyard at Sorel increased the necessity for new steamers, dredges, other plant and equipment.

The great variety of the public service, embraced within the operations of the department, is shown by the following general subdivisions of the Marine Branch alone.

THE GENERAL SUBDIVISIONS OF THE MARINE BRANCH.

The construction of lighthouses and fog-alarms.
The maintenance of lights, gas buoys and other buoys.
The lighthouse board which decides the necessity for aids to navigation.
The hydrographic surveys.
The tidal surveys.
The ship channel St. Lawrence river and Sorel works.
Meteorological and magnetic service.
Investigation into wrecks.

Board of steamboat inspection.
 Cattle shipments inspection.
 Wireless telegraph service.
 Signal service.
 Life saving service.
 Marine hospitals.
 Submarine signalling.
 Shipping under the Merchants' Shipping Act.
 Legislation and administration of laws relating to the Department of Marine and Fisheries.
 Humane service in connection with seamen.
 Wrecking plant subsidized.
 Winter communication.
 Removal of obstructions to navigation.
 Examination of masters and mates, and issuing certificates.
 Naval militia.
 Pilotage.
 Government of ports and proclaiming of harbours in the Dominion.
 Control of government wharfs.
 Dominion steamers, Marine and Fisheries.

EXPENDITURE.

The expenditure for the fiscal year ending June 30, last, was as follows:—

LIGHTHOUSE AND COAST SERVICE.

Maintenance of lights..	\$1,082,718 36
Construction of lights..	1,605,778 59
	<hr/>
	\$2,688,496 95
	<hr/>
Appropriation for maintenance and construction..	\$2,724,000 00
Deduct expenditure..	2,688,496 95
	<hr/>
Expenditure less than appropriation..	\$ 35,503 05
	<hr/>

OCEAN AND RIVER SERVICE.

Appropriation..	\$1,048,100 00
Expenditure..	1,012,265 73
	<hr/>
Expenditure less than appropriation..	\$ 35,834 27

HYDROGRAPHIC SURVEYS—SCIENTIFIC INSTITUTIONS AND ST. LAWRENCE SHIP CHANNEL.

Appropriation..	\$1,326,850 00
Expenditure..	1,167,118 90
	<hr/>
Expenditure less than appropriation..	\$ 159,731 10

SESSIONAL PAPER No. 21

MARINE HOSPITALS—STEAMBOAT INSPECTION—CIVIL GOVERNMENT.

Appropriation.	\$ 212,119 36
Expenditure.	197,371 08
	<hr/>
Expenditure less than appropriation.	\$ 14,748 28
	<hr/>
Total appropriation.	\$5,311,069 36
Total expenditure, Marine Branch.	5,065,252 66
	<hr/>
Expenditure less than appropriation.	\$ 245,816 70
	<hr/>
Total expenditure, Marine Branch.	\$5,065,252 66
Total expenditure, Fisheries Branch.	968,375 09
	<hr/>
Total expenditure of department.	\$6,033,627 75
	<hr/>

NOTE.—The fisheries expenditure is merely added to show the total expenditure of the department, and has no connection with this report.

LIGHTHOUSE SERVICE.

The lighthouse service of the Dominion is divided as follows:—The Ontario division, embracing all lights from Montreal westward to the Northwest Territories; the Quebec division, extending below Montreal and including the St. Lawrence river from Platon and the gulf of St. Lawrence and strait of Belle Isle; the Montreal division, including the St. Lawrence river from Montreal to Platon; the Nova Scotia division, including St. Paul's island, Cape Breton, Sable island and Cape Race, Newfoundland; the New Brunswick division, the Prince Edward Island division and the British Columbia division, each including lights within the provincial boundaries.

The several districts, with the exception of the district above Montreal, are in charge of agents who receive instructions from the department and report annually, in addition to communicating with the department, in connection with all matters relating to their agencies.

The total number of light stations, lightships and fog-alarm stations in the Dominion is 838, and lights shown, 1,053; the number of steam whistles, fog-horns, bells and guns, 119; the number of lightkeepers and engineers of fog-alarms with masters of lightships is 883.

The report of the chief engineer relating to lighthouse construction, repairs, hydrographic surveys, &c., contains detailed information. The principal repairs, changes and improvements at existing stations are referred to in his report, also new aids to navigation. The work done at fog-alarm stations in connection with steam whistles, compressed air horns and explosives, is dealt with under the proper headings. Information is also given respecting the extent of repairs and some account of the repairs in detail under the head of the station.

6-7 EDWARD VII., A. 1907

During the past year 18 light stations were established in all, and 4 fog-alarms, 21 buildings were erected at existing stations and 7 fog-alarm buildings were erected at existing stations.

RIVER ST. LAWRENCE SHIP CHANNEL AND SOREL SHIPYARD.

The report of Mr. Cowie forms Appendix 12 of this report, and contains in detail information relating to the River St. Lawrence ship channel. This channel now extends from Montreal to Father Point, a total distance of about 325 miles. This has been divided, for the purposes of organization and details, into five divisions.

Division I., Montreal to Sorel:—It was recognized by the department that the improvement of the channel, through the shoal, opposite Longueuil, was of very great importance, and work was commenced at the beginning of the fiscal year, 1905. It was re-commenced in 1906, and almost completed at the end of the fiscal year. Although the work was of a very difficult nature, the progress made exceeded the estimates of the officers of the department.

In division II., from Sorel to Batiscan, the estimates of the officers were also exceeded, and most of the work completed at the close of the fiscal year, leaving several of the dredges available for work below Batiscan and at Cap à la Roche.

In division III., dredge No. 7 has been engaged on the 30-foot channel, through Lake St. Peter, and the channel through the lake is now completed. Of the 18 miles requiring dredging, nearly 6 miles is widened to from 450 to 650 feet. Next year the work of widening the channel will be continued with all possible vigour.

In division IV., from Batiscan to Quebec, tidal navigation can be used. At high tides there is an additional depth available of 3 feet at Batiscan, 4 feet at Cap a la Roche, 5 feet at Grondines, and about 10 feet at Ste. Croix and St. Nicholas at neap-tides.

The work in this district was concentrated on the non-tidal portion of the river until its completion. The 30-foot depth is available by taking advantage of high tide from Batiscan down.

The commencement of the important work, from Batiscan to Quebec, was made early in 1906, and some work at Cap à la Roche was begun.

Before the close of navigation, 1906, the 30-foot channel was completed from Montreal to Batiscan, so that navigation for that depth is now available, by taking advantage of high tide between Batiscan and Quebec, right up to Montreal.

Division V., Quebec to Father Point. The year 1906 has been an eventful one in the navigation of the St. Lawrence river, owing to the arrival of large steamers specially constructed for navigation between the ports of Montreal, Quebec and Great Britain. In order to make as much progress in the work of dredging the channel as possible, a European-built twin screw, sea-going, suction hopper dredge, built in 1904, was purchased for the sum of £30,000.

SESSIONAL PAPER No. 21

This dredge was placed at work at Beaujeu bank, 35 miles below Quebec, and before the close of navigation of 1906, an amount of about 100,000 cubic yards was removed from the channel opposite Crane island.

The season of 1906 was not only very successful, with regard to the progress of the improvements, but also for safe navigation.

The St. Lawrence, like all other waters of North America, has felt the effects of the exceedingly dry summer. The water has been lower than usual throughout the whole season, and for the months of September, October and November the large vessels were not able to load to their full capacity. The lowest depth reached was, however, 6 inches higher than the standard adopted for low water, or the low record of the year 1897, which was the lowest on record, except for the extraordinarily low water of 1895, which, for a few days, reached a stage 6 inches lower.

The usual sweeping of the channel was carried out, as well as all assistance given in the interest of navigation.

The total amount of dredging for the fiscal year amounted to 4,047,530 cubic yards, and the average cost 10½ cents per yard.

The Sorel shipyard has been fully occupied in the construction and repairs to dredges, tugs and steamers for the Department of Marine and Fisheries, Public Works Department and a steamer for use in Hudson Bay for the Mounted Police Department. Mr. G. J. Desbarats is director of the shipyard and his report forms Appendix No. 3 of this report.

The dredge *W. S. Fielding*, built at the Sorel shipyards for the Public Works Department, was finished in July last, and several vessels belonging to the dredging fleet of the same department were repaired during the year.

The steamer *Rouville* was built for the Mounted Police Department for use in Hudson Bay and launched on June 5 last.

For the Marine and Fisheries Department a sea-going hopper dredge is being built for use on the St. Lawrence river ship channel. The tug *Portneuf* for use with the dredging fleet of the ship channel was constructed; the *Jessie Hume*, for the same work, was extensively repaired and the hulls and machinery of the dredges and tugs of the ship channel fleet put in and maintained in good condition. This forms a large part of the work done at the Sorel shipyard.

The steamers *La Canadienne* and *De Levis* used in hydrographic work, were both repaired. The *La Canadienne* was partly rebuilt and made more suitable for the special work in which she is engaged.

The steamer *Verchères*, for lighthouse service of this department, was begun in January last and launched in August. Several vessels attached to lighthouse inspection and delivery work were repaired during the year.

Steel lighthouse towers were constructed in the shipyard, and repairs and alterations were made to other steel-lighthouse towers.

6-7 EDWARD VII., A. 1907

The *Arctic*, engaged in the Hudson Bay expedition work, was overhauled and repaired and materials furnished for her cruise.

The shipyard was much improved by the construction of a building of steel frames and brick walls, for use as a sub-station for electric power. The steam engines of the shipyard are not now used, as electric power has been substituted. A steel frame saw-mill with wooden walls was erected, and this building is also used for the accommodation of the wood working machinery of the shipyard.

An extension was made to the blacksmith shop and forges were erected.

In addition to the above, electric motors, electric driven turbine pumps and a hydraulic machine were installed.

WRECKING PLANT.

Yearly subsidies of \$10,000 are paid contractors who maintain wrecking plant, always available under contract to assist vessels which meet with marine accidents in certain divisions of Canadian waters.

The contracts at present existing are with Messrs. George Davie & Son, of Quebec, who keep the tug *Strathcona* and other plant in readiness to assist vessels that meet with marine accidents in the Lower St. Lawrence river. The subsidy of \$10,000 was paid Messrs. Davie & Son for the year ending June 30, 1906.

The British Columbia Marine Railway Company are the contractors for maintaining the wrecking plant at Esquimalt, always available in the waters of British Columbia. This plant has been used during the past season, and succeeded in getting off the steamer *Mariechen*, which went ashore in False bay, Alaska, and was towed into Esquimalt for extensive repairs. The subsidy of \$10,000 was paid the British Columbia Marine Railway Company for the year ending June 30, 1906.

Tenders were invited publicly for a wrecking plant to be stationed at North Sydney, in Cape Breton, to render assistance to vessels meeting with accidents in the waters of the maritime provinces and Gulf of St. Lawrence. The tenders are now under consideration.

LIST OF VESSELS SAFELY SALVED FROM JULY 1, 1905.

- By Messrs. George Davie & Sons, in the Gulf and River St. Lawrence.
- Str. *Pilot*, St. Antoine, July 1, 1905.
 - SS. *Aranmore*, Labrador Coast, July 1, 1905.
 - SS. *Unique*, St. Croix Bay, August, 1905.
 - SS. *Wastwater*, Anticosti, September, 1905.
 - SS. *Victorian*, Cap La Roche, September, 1905.
 - SS. *Virginian*, Crane Island, October, 1905.
 - Schr. *Tyree*, Rocky Bay, C.B., May, 1906.
 - SS. *Bray Head*, English Bay, May 1906.
 - SS. *Campana*, St. Valier, May, 1906.
 - SS. *Cervona*, Anticosti, July, 1906.
 - SS. *Kensington*, assisting Str. *Quebec* to Montreal, November, 1906.

SESSIONAL PAPER No. 21

SICK AND DISTRESSED MARINERS.

MARINE HOSPITALS.

Under the provisions of chapter 76, revised statutes, dues of two cents per ton register is levied on every vessel arriving in any port of the provinces of Quebec, Nova Scotia, New Brunswick, Prince Edward Island and British Columbia, the money thus collected forming the Sick Mariners' Fund. Vessels of the burden of 100 tons and less pay the duty once in each calendar year, and vessels of more than 100 tons, three times in each year.

By an amendment of this Act, passed at the session of parliament in 1887, 50-51 Victoria, chapter 40, it is provided that no vessel, not registered in Canada, and which is employed exclusively in fishing or on a fishing voyage, shall be subject to the payment of this duty.

The receipts for the fiscal year ended June 30, last, amounted to \$60,281.82 less \$97.92 refunds, making the net receipts \$60,183.90, being an increase of \$1,811.56, as compared with the previous year. The expenditure for the several provinces amounted to \$50,120.42, a decrease of expenditure of \$879.76 for the past fiscal year.

The receipts from the provinces of sick mariners' dues were as follows:—Nova Scotia, \$19,229.08; New Brunswick, \$11,698.48; Quebec, \$16,982.02; British Columbia, \$12,214.38; Prince Edward Island, \$357.86. The Sick Mariners Act does not apply to Ontario, and consequently no dues are collected from vessels in that province.

In the province of Quebec the expenditure on account of sick seamen amounted to \$9,072.35. The total collections for the entire province amounted to \$16,982.02, being \$327.56 less than the previous year.

At the port of Quebec, sick seamen are cared for at the Jeffrey Hale and the Hotel Dieu hospitals; a per diem allowance is made for each seaman for medical attendance and board.

At the port of Montreal, sick seamen are cared for at the General Hospital and at Notre Dame Hospital, under an arrangement made by the department, by which \$1.20 per diem is paid for board and medical attendance of each seaman.

The expenditure on account of sick seamen, in the province of New Brunswick for the fiscal year, amounted to \$10,449.42, and the collection of dues to \$11,698.48, or \$1,234.34 less than the previous year. Marine hospitals have been maintained at Miramichi, Richibucto and Bathurst.

In the province of Nova Scotia, marine hospitals are maintained at the ports of Louisburg, Yarmouth, Pictou, Sydney, Lunenburg and Point Tupper. The total expenditure on account of sick seamen in the province of Nova Scotia, for the fiscal year amounted to \$20,128.10, and the receipts to \$19,239.48.

At Halifax, provision is made for the care of sick seamen, at the Victoria General Hospital, under arrangements made with the managers by which the sum of \$1.20 per diem is allowed for board and medical attendance.

6-7 EDWARD VII., A. 1907

In the province of Prince Edward Island, the sum expended on account of sick seamen, during the fiscal year, was \$1,776, and the receipts from sick mariners' dues, \$359.86.

Sick seamen are cared for at the Charlottetown and Prince Edward Island hospitals, under arrangements made with the managers of these institutions.

In the province of British Columbia, the sum of \$8,582.26 was expended for sick and disabled seamen, while the receipts from the collection of sick mariners' dues amounted to \$12,214.38.

The marine hospital at Victoria has in attendance, a medical superintendent, with a salary of \$300 per annum, and a keeper, whose salary is \$500 per annum. He is also allowed a rate of \$5 a week for board and attendance of each seaman.

At the ports where no hospitals are established, in the province of Quebec, Nova Scotia, New Brunswick, British Columbia and Prince Edward Island, sick seamen are cared for, under the chief officer of customs, when the vessel to which the seamen belong has paid the dues according to law. A circular to collectors of customs was issued February 7, 1891, permitting sick seamen to be attended at the port of arrival of a vessel, provided that the regular dues are previously paid at some port.

During the fiscal year the sum of \$548.23 was expended for shipwrecked and distressed seamen, for which there was a parliamentary appropriation of \$3,000.

The total expenditure on account of sick seamen and marine hospitals amounted to \$50,120.42, including expenditure for printing and stationery, and the appropriation of parliament for the service was \$50,000. The dues collected amounted to \$60,183.90.

SESSIONAL PAPER No. 21

MERCHANT SHIPPING.

The total number of vessels remaining on the registry books of the Dominion on December 31, 1905, including old and new vessels, sailing vessels, steamers and barges, was 7,325, measuring 669,825 tons register tonnage, being an increase of 173 vessels and a decrease of 13,013 tons register, as compared with 1904. The number of steamers on the registry books on the same date was 2,654, with a gross tonnage of 362,888 tons.

The number of vessels in the registry books of the Dominion on December 31, 1905, will appear in detail in supplement No. 1, of this report. The number of new vessels built and registered will also be shown, and a comparative statement of the tonnage of new vessels built and registered, from 1874 to 1905, both inclusive.

The statements showing the number of vessels and number of tons on the registry books at the different ports of registry, in the Dominion appears in the list of vessels published for the year ending December 31, 1905, and that for the year 1906 will appear in the next list of shipping.

STATEMENT showing the Tonnage of each of the Maritime States of the World, compiled from the Répertoire Général for 1904-5.

STEAMBOAT INSPECTION.

The total number of steamboats reported in the several districts in the Dominion, is 1,805, the gross tonnage being 325,982. Fees were collected for inspection amounting to \$4,932.58; the fees from engineers for certificates amounted to \$1,237.50, making the total receipts from steamboat inspection and engineers' certificates \$6,170.08. The net receipts to the credit of the fund for the previous year amounted to \$10,818.78.

The total expenditure in connection with inspection was \$37,590.22. The decrease of expenditure for the last fiscal year was \$25.09.

The consolidated laws relating to steamboat inspection came into force on the first day of January, 1889. The report of the chairman of the board of steamboat inspection forms appendix No. 5.

The following is a comparative statement of the receipts and expenditures in connection with steamboat inspection:—

Owing to an amendment of the Steamboat Inspection Act of 1898, whereby fees for inspection of Dominion registered steamers were abrogated, there has been a falling off in receipts compared with those for the previous year, the fees as shown having been collected from steamers inspected but registered elsewhere than in Canada to the number of 142, having a gross tonnage of 144,180.

SESSIONAL PAPER No. 21

An Act to amend the Steamboat Inspection Act of 1898 was passed and assented to July 18, 1904; the following is a copy:—

His Majesty, by and with the advice and consent of the Senate and House of Commons of Canada, enacts as follows:—

1. Subsection 1 of section 6 of the Steamboat Inspection Act, 1898, is amended by adding thereto the following paragraph:—

(g) For the inspection of the machinery and equipment of steamboats propelled by gas, fluid, naphtha, electricity, or any other mechanical or chemical power, and in case of such vessels for making such changes in forms A and B of the second schedule hereto as he deems advisable.

NAMES OF INSPECTORS.

C. T. Schmidt.....	Inspector of Dominion Steamers.....	Halifax.

INVESTIGATIONS INTO WRECKS.

Investigations were held into the causes of wrecks and other casualties in the river and gulf of St. Lawrence on the Atlantic coast, British Columbia coast, the Ottawa river and Lake Winnipeg.

There were sixteen investigations altogether; two into casualties in British Columbia, one in Lake Winnipeg, one on the Ottawa river, five on the Gulf and River St. Lawrence, and seven on the Atlantic coast.

The casualties up to the present time on the St. Lawrence route have been few, and these were of no great importance. The details of the investigations will be found in the report of Commander Spain, which forms appendix No. 13 to this report.

WIRELESS TELEGRAPHY.

There are thirteen stations in operation on the St. Lawrence route and the Atlantic seaboard for commercial purposes. Two more stations are now in course of construction; one at Father Point and the other at Clarke City (Seven Islands). As an aid to navigation, the wireless stations established by the government have been of the

6-7 EDWARD VII., A. 1907

greatest benefit, and on occasions there is no doubt that serious delays and probably accidents to ocean liners have been averted by the use of this system.

The steamers *Stanley* and *Minto* were employed during the season of navigation, in conveying men and material to the stations that were established during 1906, and these steamers are equipped for receiving wireless messages. The steamer *Lady Laurier*, engaged in the lighthouse and buoy service, Nova Scotia, has also been equipped in the same manner.

At some of the stations, numerous messages have been received, but the department has not yet completed arrangements for reporting the exact number transmitted or received at each station in connection with shipping.

The station buildings were erected and equipped under contract with the Marconi Wireless Telegraph Company, of Canada, and that company must transact its business under license from the Minister of Marine and Fisheries, with the consent of the Governor General in Council, as provided in the Canadian Statute 4-5 Edward VII., chap. 49.

The establishment of these stations has been of great assistance to shipping, as testified by managing owners of steamship lines. The report of wireless telegraphy forms appendix No. 14. The amount of expenditure for the fiscal year in connection with this service will be found in the statement of expenditure, Appendix No. 8.

SUBMARINE SIGNAL SERVICE.

The department is engaged in establishing electric submarine signal stations at Louisburg, Yarmouth, N.S., and Negro Head, N.B., and two submarine bells.

Two submarine signal bells have been established in the approach to Halifax harbour, for the use of vessels fitted with the necessary apparatus to receive such signals, as well as for vessels generally. The bells are each fitted to an iron tripod resting on the bottom, and one bell is sounded electrically through a submarine cable connection from the fog-alarm station at Chebucto head. The second bell is intended as a duplicate to be used should the other become inoperative. They are located two cables north 1° E. from the inner automatic gas and whistling buoy, and during thick or foggy weather there will be sounded on the bell, four strokes at intervals of 4½ seconds, followed by a silent interval of 6½ seconds.

A wooden building, fitted with the necessary electric apparatus, has been erected alongside the fog alarm station on Chebucto head, and the submarine cables connecting the bells therewith have been laid by the C.G.S. *Lady Laurier*.

CERTIFICATES TO MASTERS AND MATES.

During the year ended June 30, 1906, 12 masters, 17 mates and 28 second mates' seagoing certificates of competency; 250 masters' and 86 mates' coasting or inland certificates of competency; and 4 masters' coasting or inland certificates of service, were issued.

SESSIONAL PAPER No. 21

The total amount collected in fees from applicants for examination during the fiscal year ended June 30, 1906, was \$5,526, and the amount expended on account of this service was \$7,068.15, an excess of expenditure over receipts of \$1,542.15.

The following statement shows the total receipts and expenditure on account of masters and mates since 1871:—

	Expenditure.	Receipts.
	\$ cts.	\$ cts.
For the fiscal year ended June 30, 1871.....	1,410 45

Excess of expenditure over receipts.....	46,246 16	

CORRESPONDENCE.

About 35,537 letters were received in the department during the fiscal year. The correspondence was carefully examined and replied to as far as necessary. About 18,000 letters were sent out during the same period. Forms, reports, circular letters and notices inviting tenders, are not included in the number of letters addressed to this department or sent out.

These forms, &c., are numerous and require special attention, as the matters to which they refer are important.

In the records branch of the department, the letters received are carefully examined, entered in the record book, placed on file, and the copy of the reply attached, so that the letters and answers can readily be seen and any subject easily followed up.

WINTER STEAMERS AND ROUTES.

The steamer *Stanley* took up the service between Summerside, P.E.I. and Cape Tormentine, N.B., on December 16, 1905, exactly the same date as she began the service in 1904. The steamer continued on the route with several interruptions of the round trips until January 10. From January 1 to 10 the trips were made with great difficulty on account of the quantity of heavy northern ice that drifted into the strait, filling Summerside Bay and Harbour. On January 9 the *Stanley* was from 7 a.m. until 4 p.m. making the trip from Summerside to Cape Tormentine. It was then decided to abandon this route and the *Stanley* left Cape Tormentine on January 10 for Georgetown, arriving at the latter place in the afternoon. The straits were found very full of sheet and drifted ice.

The steamer began to ply on the route between Georgetown and Pictou on January 11.

The steamers *Minto* and *Stanley* performed the service of crossing on alternate days, each steamer making tri-weekly trips. The trips between Georgetown and Pictou were continued until April 4, when the *Stanley* was taken off this route and put on between Charlottetown and Pictou and continued on that route until April 20, making tri-weekly trips with the *Minto* from Charlottetown to Pictou. The *Stanley* carried 3,128 tons of freight, 1,823 passengers, furnishing meals and berths to passengers. The earnings for freight amounted to \$4,512.31, and that for passengers to \$3,972.50, making the total earnings of the *Stanley* from December 16 to April 20, \$8,484.81. On April 24 the *Stanley* entered into the service of placing automatic and other buoys.

'MONTCALM.'

The *Montcalm* was engaged in breaking the ice bridge at Cape Rouge. The weather remained fine during the greater part of the season. The accumulation of ice was not so great, nor was it so closely packed as during the previous winter, so the *Montcalm* made almost daily trips to what is called the ice bridge to break it. This gathering of the ice very often occurs at Cape Rouge, but the *Montcalm* succeeded in breaking it when it stopped, and this had the effect in many instances of keeping the river clear as far as Three Rivers.

The *Montcalm* was employed in making a trip to the Seven Islands on January 26, and another trip to the same place on March 21 without accident, showing the capacity of the steamer in keeping open navigation. The same steamer was sent to Gaspé in the month of April when the ice was nearly two feet thick, and opened the harbour to navigation. The *Montcalm* was also employed in breaking ice in the Saguenay river, and succeeded in going up the river for many miles.

'CHAMPLAIN.'

The *Champlain* is also an ice-breaking steamer and is employed in ferry service between Rivière Ouelle wharf, Cap-à-l'Aigle and St. Irénée and Murray Bay during the whole year. The steamer encounters very much ice during winter, and notwithstanding the difficulties and the liability of being carried out of her course by the large fields of ice passing, she managed to keep up the service remarkably well.

SESSIONAL PAPER No. 21

Over 9,000 passengers were carried in the year, the greater part, of course, during the summer months, and large quantities of freight and baggage.

The total receipts for the fiscal year amounted to \$5,706.14.

'MINTO.'

The *Minto* was engaged from the 9th of December to carry goods to the Magdalen islands, the regular steamer *Lunenburg* having been wrecked. The steamer returned to Pictou and entered upon the winter service of carrying freight to Charlottetown, but did not enter upon the regular tri-weekly trips until the 27th of the same month. She continued on this route until January 8, 1906, when the steamer took up the service between Georgetown and Pictou in conjunction with the *Stanley*, making the tri-weekly trips between Georgetown and Pictou. The daily crossings were therefore effected between the two steamers; each steamer leaving on alternate days.

On March 3 an attempt was made by the captain of the steamer to go to Charlottetown, but the *Minto* did not succeed in reaching that port, owing to the heavy rafted ice and was compelled to return to Georgetown and continue the tri-weekly trips until March 24, when another effort was made to reach Charlottetown, but without success. The *Minto* had again to return to the Georgetown route and continued on that route until April 3, when this vessel succeeded in reaching Charlottetown and continued making tri-weekly trips between Charlottetown and Pictou until April 20.

The steamer was immediately engaged in departmental work after she had finished the winter service, until May 1, and then she was placed on the route between Charlottetown and Pictou, for a few days, to take the place of one of the Charlottetown Steam Navigation Co.'s boats and then entered upon the Marconi Wireless Telegraph service.

The *Minto* carried 3,517 tons of freight, 1,924 passengers. The earnings for the freight amounted to \$5,405 and for carrying passengers, \$4,813, making the total earnings \$10,218.91.

'ARCTIC.'

The *Arctic* is also classed amongst the ice steamers as she was purchased for the Hudson bay expedition and has been engaged in that service.

The *Arctic* left Quebec on the 7th September, 1904, and returned to the same port October 6, 1905.

The machinery of the steamer had become injured and extensive repairs were made at the Sorel shipyard. This vessel was again sent to the Hudson bay on July 28, 1906.

ICE BOAT SERVICE BETWEEN CAPES TRAVERSE AND TORMENTINE.

Sixteen ice-boats were built during the year in connection with this service at a cost of \$1,187, and some of the old boats repaired. The boat-houses at Cape Tormentine and Cape Traverse were also repaired and put in good condition.

The officers and the crews were selected and given instructions to be in readiness in case the ice boats should be required; but owing to the fact that the *Stanley* and the

6-7 EDWARD VII., A. 1907

Minto were able to make tri-weekly trips between Georgetown and Pictou throughout the winter, the ice boats were not called into requisition.

The expenditure for equipment and other charges in this service amounted to \$3,297.75.

The keeping of the stations and boats in a good state of repair and equipment is necessary in case the winter steamers are prevented by ice from carrying the mails regularly. When the steamers are stopped the mails have, in the past, been carried by the small boats between the mainland and Prince Edward Island.

ILLUMINANTS AND ILLUMINATING APPARATUS.

Improvements in the coast lights have been made at important coast light stations by the substitution of modern dioptric quick flashing lights for the pattern formerly used. At Greenly island, in the strait of Belle isle, a second order light has been installed. The department has received a first order quick-flashing light for Heath point, Anticosti, in the Gulf of St. Lawrence, but it will be too late to erect it before next season.

A first order quick-flashing light is in process of erection at Sambro, Nova Scotia, and a third order light has been installed at Maugers' beach, Halifax harbour, and a fourth order light on Pictou island, all in Nova Scotia. A third order light has been installed at Point Macquareau, at the entrance to Bay Chaleur, and a similar order at Bryon island, in the Gulf of St. Lawrence, near Magdalen island, and fourth order lights at Cape Tryon, Seacow head and Cape Egmont, Prince Edward Island.

Several large automatic gas buoys have been placed off the coast of Nova Scotia, in the Bay of Fundy. These buoys replaced the old unlighted Courtney whistling buoys and are fitted to receive submarine bell attachments.

Signal service off Chebucto head, Halifax harbour, has been established and is in operation. The department is now engaged in placing electric submarine signal stations at Louisburg, Yarmouth, N.S., and Negro Head, N.B.

Arrangements have been completed for the erection of a hyper-radial single flashing light at Cape Race, Newfoundland. The tower has been built and the lantern is at the station and the apparatus to be placed in the light has arrived at Halifax, but owing to the lateness of the season it is not possible to install this light during the present year. It will, however, be put in operation as soon as practicable next season. So far as the department is aware this light carries the most powerful apparatus on the continent and it is expected to prove of the greatest benefit to navigation.

Petroleum has been largely used in the lighthouses as in former years. A more extended use of vapour gas has been made in the lighthouses and acetylene has been used in the gas buoys.

SESSIONAL PAPER No. 21

BUOYS AND BEACONS.

As usual the buoy service has received careful attention by the department, the numerous bays, inlets, rivers, lakes, harbours, and other navigable waters constantly require supervision and addition of aids to navigation.

The number of buoys has constantly increased, which, of course, requires increased expenditure. The expenditure for the year 1905-6 amounted to \$121,834.61.

The districts now buoyed number about 365, and the buoys number about 4,200. A record of the names of the shoals, dangers, reefs and various points in channels, harbours, &c., where buoys are placed, is carefully kept; this enables the department to immediately locate the buoys when any reference is made to them in the correspondence.

The contract system has been found to work most economically, but not always as efficiently as desirable, owing to neglect on the part of some contractors to carry out the conditions of their contracts; in the majority of instances the contracts are immediately under the supervision of departmental officers, whose duty it is to report to the department any neglect of work on the part of the contractors. There are now about 200 contracts. These contracts are generally made for a period of three years. The contractors are paid semi-annually upon the certificate of the superintending officer. There are, however, some districts not under contract, the work being attended to by the harbour masters. In these cases it has been found more advantageous to place the work immediately in the hands of these officers.

A large number of whistling, gas, bell and other iron buoys are maintained along the coast of the several provinces, by Dominion steamers, particularly on the Nova Scotia, New Brunswick and British Columbia coast. These buoys are called coast buoys to distinguish them from harbour buoys. The cost of maintaining and placing by the steamers is not charged directly to the buoy service, but is included in the cost of maintenance of the steamers, which frequently perform the double duty of attending to lighthouses and the coast buoy service on the same trips.

The expenditure in connection with the buoy service for the year ended June 30, 1905-6, was as follows:—

Above Montreal.	\$ 11,469 52
Quebec.	59,513 58
New Brunswick.	13,564 34
Nova Scotia.	22,479 73
Prince Edward Island.	7,639 12
British Columbia.	7,168 32
	<hr/>
	\$121,834 61

In addition to the buoys for marking dangers, gas buoys are maintained, showing in general, occulting lights, in the Quebec agency, 21; on the St. Lawrence river between Platon and Montreal, 51; between Montreal and Kingston, 37; in Pelee

6-7 EDWARD VII., A. 1907

passage, 2; at mouth of Detroit river, 1; at Port Colborne, 1; in Georgian bay, 4; at Port Arthur, 7; in Nova Scotia, 17; in New Brunswick, 7, and in Prince Edward Island, 1.

The coast buoy service maintained by the Dominion steamers on the coast of Nova Scotia, consists of 27 automatic whistling buoys, 4 gas buoys, 30 bell buoys and 172 steel can and conical buoys, 12 combined gas and whistling, 1 combined gas and bell. The changes were made by substituting 9 combined gas and whistling buoys for 9 Courtney whistling buoys and 3 combined whistling buoys were added to the number already in the water making the total, as above stated, 12 combined gas and whistling buoys.

In the New Brunswick agency there are maintained in the same way, 22 signal buoys, 21 steel can and conical buoys and 1 bell buoy, and 7 gas buoys. The signal coast buoys of Prince Edward Island number 6, and the steel can and conical buoys 6 and 1 gas buoy. In the province of Quebec there are 66 can and conical buoys, 1 bell buoy and 1 whistling buoy maintained by the Dominion steamers.

The steamer *Shamrock* is constantly employed in the buoy service, on the St. Lawrence river between Montreal and Quebec, and the steamer *Scout* between Montreal and Kingston; the latter steamer attends to the gas buoys above Montreal on the St. Lawrence river. The steamer *Druid* performs the buoy service below Quebec and attends to the gas buoys in the Quebec district.

The coast buoy service in British Columbia is performed by the Dominion steamer *Quadra*. There are 3 whistling, 2 bell buoys, 7 conical and 19 can buoys. The service at the mouth of the Fraser river is performed by the Public Works steamer *Samson*, employed for the buoy service by the department.

TIDAL AND CURRENT SURVEY.

Exceptional progress has been made in the Tidal Survey Branch during the past year, and the information added to the tide tables has been so large as to necessitate remodelling their form, and an important advance in the improvement of the accuracy of the tide tables has resulted.

An investigation of the currents has been carried on under Dr. W. B. Dawson, engineer in charge of the survey, the region chosen being the Belle isle strait. The Dominion steamer *Gulnare* was employed, as well as the schooner *Laura*, which was chartered for the season. The observations were made continuously day and night, so far as weather permitted, and a continuous record of the tide for comparison with the current, was obtained at Forteau bay in the strait. The strait is considered almost equal in importance to the St. Lawrence, in the volume of traffic which it carries during the season of navigation, and this traffic is carried on by steamships. The only sailing vessels in the strait are schooners and fishing boats.

A detailed report on the movements of the currents in the Belle isle strait, is being prepared by Dr. Dawson, and the information which it will contain will be of important value to shipping. The tidal stations on the Atlantic and St. Lawrence coast have been maintained in continuous operation throughout the year.

SESSIONAL PAPER No. 21

Full tide tables are published for four of the principal stations on the eastern coast, viz.: Quebec, Father Point, Halifax, St. John, N.B., and tables giving the time of the tide only, for Charlottetown, Pictou, St. Paul Island and Yarmouth, N.S.

The tidal information for the St. Lawrence is now very comprehensive. For the Pacific coast, complete tide tables are published for Victoria, Sand Heads, in the Strait of Georgia, and Port Simpson. In all cases the tidal information published is based upon actual observation at the localities in question, and nearly all of these will be given in the tide tables for 1907.

The report of the chief engineer contains a summary of the work that has been done throughout the past season, and the report of Dr. Dawson in detail will be furnished in the supplement.

WHARFS.

The department has under its control a large number of wharfs in charge of wharfingers. These wharfs have from time to time been transferred to the department as they have been acquired by the government or built by the Public Works Department. Wharfingers, regularly appointed, collect tolls from vessels and owners of goods who use the wharfs. Some of the piers are breakwaters to afford shelter to vessels at which they are moored.

The most valuable wharf properties are connected with the agencies of the department. The King's wharf property at Quebec accommodates the departmental steamers, quarantine steamers and Public Works steamers. It was found necessary to increase the accommodation at Quebec, and the department leased from the harbour commissioners a very suitable wharf adjoining the King's wharf for a term of five years, at \$1,200 per annum. The marine stores, machinery and blacksmith and carpenter shops are connected with the King's wharf. Large numbers of buoys, boats and other equipment and coal for use of the steamers, are stored on this wharf.

At Charlottetown extensive repairs have been made to the marine wharf during the year, and an extension of the railway track completed to enable freight to be delivered and taken directly from the winter steamers and loaded on board cars.

At Dartmouth, opposite Halifax, an extensive wharf property is owned and used for the steamers of the department and for the same purpose as at Quebec. The expenditure for the property and making it suitable has been considerable, but the outlay has been justified by the excellent accommodation which is now afforded the department for steamers, storing of supplies and spare articles used in connection with aids to navigation. A statement of wharfs and wharfingers forms Appendix No. 11.

LIFE-BOAT STATIONS.

There are 28 life-saving stations in the Dominion of Canada. Most of these have crews that drill two or three times a month. The men are paid \$2 for each drill, and an extra sum is paid when any service is rendered to shipwrecked mariners.

6-7 EDWARD VII., A. 1907

At Long Point, Lake Erie, the men are permanently stationed during the months of September, October and November at the life-saving station, which is well equipped for their accommodation and that of those who may be rescued. The men receive \$40 per month during the three months, and are paid for weekly drills during the other months of the season of navigation.

Toronto Island.—Captain Ward went to the rescue of the gasoline launch *Ogee*. The launch appears to have been left helpless in the lake, and a strong north wind was blowing her rapidly into the lake when Captain Ward and his two sons rowed to the launch and towed her to a place of safety.

The *Reuben Dowd*, a three masted sailing vessel went ashore on August 24. The accident was due to the rudder of the vessel becoming disabled. A high wind was blowing and a fairly high sea running. The vessel struck on the beach. The Toronto Life Saving crew under Captain Ward went to the rescue and landed all in safety on shore. The crew consisted of six men and one woman cook. The crew also went to the assistance of a dredge scow. The scow broke up and sunk in the channel. No lives were lost.

On August 8 Captain Ward went to the assistance of three young men in a yacht drifting into the lake. The rudder of the yacht was broken.

Long Point, Ont.—In the month of October, 1906, the life-boat crew went to the assistance of the iron steamer *Vulcan*, which had grounded, conveyed the men to Port Rowan and aboard again and stayed by the ship until she got off.

Cobourg, Ont.—One member of the life-boat crew, in August, 1906, went to the assistance of two young men, whose sail-boat had capsized in the lake opposite Cobourg, and brought them safely to shore.

Barker's Cove, Yarmouth, N.S.—The barque *Torrens* ran ashore on Sunday point in a thick fog in August, 1906, and the life-boat crew went to the vessel for the purpose of rendering assistance, but the vessel was towed off with tugs and the crew was not in danger.

Clark's Harbour, N.S.—The life-saving crew went to the assistance of the *Etolia* in June, 1906, at Cape Sable, and stood by the vessel for sixty hours, landing men and rendering other assistance.

Port Mouton, N.S.—In July, 1906, the life-saving crew assisted in taking off the crew of the steamer *Horo Prosgrund*, and landed them. They were engaged seven hours in doing this work.

Blanch, N.S.—The life-saving crew in June, 1906, went to the assistance of the wrecked steamer *Richard*.

LIFE-SAVING SERVICE IN BRITISH COLUMBIA.

The first step towards the inauguration of a life-saving service has been taken by the construction at Vancouver of a self-righting and self-bailing life-boat 35 feet long. A crew was organized in Victoria and drilled in the management of the boat.

SESSIONAL PAPER No. 21

The department is now considering the matter of establishing a life-saving station at Banfield Creek, with quarters for the crew, and also the matter of establishing life-saving crews at Clo-oose, Ucluelet and Clayoquet, where it is probable that crews can be engaged to man the boats. It has also been suggested that a life-boat be placed on board the wrecking steamer *Salvor*; this question is under consideration, and also the matter of providing a motor boat for the life-saving service.

The coast of Vancouver Island, between Port San Juan and Cape Beale is straight, and the cliffs high and bold. There are not any indentations or bays along the coast where stations can be established apart from those places mentioned.

A full report has been made on the subject and will be found in the Chief Engineer's report, which forms Appendix 1.

A list of the life-boats and stations of the Dominion forms Appendix 18 of this report.

SABLE ISLAND.

Owing to the isolated and peculiar position of Sable island, a report of the Superintendent of the island is published as an appendix to this report. Fortunately no wrecks or casualties occurred during the year and the boats and apparatus for life-saving have been used only for drills and the landing of supplies. The island is patrolled.

Cattle and horses are raised on the island and the increase among the wild horses during the past year has been above the average. There are now on the island 85 head of horned cattle, 35 trained horses, 2 stock stallions (imported), 6 stock mares (imported), and 200 wild ponies.

The number of people on the island is 42, including the superintendent and his family.

The report of the superintendent forms Appendix 17 of the report.

ICE-BREAKING IN THUNDER BAY.

In the autumn of 1904, the large harvest in the northwest was the cause of a congestion of freight at Port Arthur and Fort William, at which ports an enormous quantity of grain had been delivered from cars to be carried by water, east. The department undertook to keep the lights and other aids to navigation in the vicinity in operation and enable vessels to clear from these ports. It was also found necessary to break the ice near the wharfs and to keep it clear. The experiment was successful and the following season tenders were called for a more comprehensive system of ice-breaking in both harbours. Six or seven tugs, including a powerful ice-breaker, were employed in breaking ice and removing it out into the bay. The work was successfully carried out and navigation was kept open until December 15 without difficulty. The amount paid under this contract was \$20,312.50.

In the spring of 1906 the harbours were again opened by means of an ice-breaking tug, at a cost of \$3,800, and for the first time on record navigation in Thunder bay was open ahead of Duluth, in the United States.

6-7 EDWARD VII., A. 1907

The work has been especially under the control of Mr. B. H. Fraser, assistant engineer, and a full report will be found in the report of the Chief Engineer, appendix No. 1.

OIL FOR USE OF LIGHTHOUSES.

The department entered into a contract with the Canadian General Supply Company, Ltd., of Montreal, for supplying lighthouse oil for the season of 1906.

The specification upon which the contract was based required the oil to weigh, at 62° Fahr., not less than 7 lb. nor more than 8 lb. per gallon, and to withstand a flash test of 115° Fahr.

Oil was also purchased from New York, for use in the dioptric lights. The oil supplied was made according to a specification prepared by the American Lighthouse Board.

COASTING TRADE OF CANADA.

By the provisions of chapter 83, Consolidated Statutes of Canada, being an Act respecting the Coasting Trade of Canada, no goods or passengers can be carried by water from one port in Canada to another except in British ships, but the Governor in Council may from time to time declare that the Act shall not apply to ships or vessels of any foreign country in which British ships are admitted to the coasting trade of such country, and to carry goods and passengers from one port or place to another in such country, the parliament of Canada was empowered to pass the Act alluded to, under the provisions of the Imperial Act, 32 Vic., chapter 11, intituled: 'An Act to amend the law relating to the Coasting Trade and Merchant Shipping of British Possessions,' which came into operation in this country on its proclamation by the Governor General on October 23, 1869.

It was ascertained that the following countries, viz., Italy, Germany and Netherlands, Sweden and Norway, Austria-Hungary, Denmark, Belgium and the Argentine Republic allowed British ships or vessels to participate in their coasting trade on the same footing as their own national vessels:—the ships of Italy, by Order in Council of August 13, 1873; those of Germany, by Order in Council of May 14, 1874; those of the Netherlands, by Order in Council of September 9, 1874; those of Sweden and Norway, by Order in Council of November 5, 1874; those of Austro-Hungary, by Order in Council of June 1, 1876; those of Denmark, by Order in Council of January 25, 1877; those of Belgium, by Order in Council of September 30, 1879; and those of Argentine Republic, by Order in Council of May 18, 1881, were admitted to the coasting trade of Canada.

The following Act, entitled an Act respecting the Coasting Trade of Canada, was assented to May 15, 1902, and relates to the payment of duty on foreign-built British ships:—

His Majesty, by and with the advice and consent of the Senate and House of Commons of Canada, enacts as follows:—

1. In this Act, unless the context otherwise requires, the expression 'British Ships' means and includes all ships belonging wholly to persons qualified or entitled to

SESSIONAL PAPER No. 21

be owners of British ships, under the provisions of 'The Merchant Shipping Act, 1894,' and any other Act of Parliament of the United Kingdom in that behalf, in force for the time being.

(2) For all purposes of this Act the expression 'the coasting trade of Canada' shall be deemed to include the carriage by water of goods or passengers from one port or place in Canada to another port or place in Canada.

2. No foreign-built British ship, whether registered in Canada or elsewhere, shall be entitled to engage or take part in the coasting trade of Canada, unless such foreign-built British ship has first obtained a license for that purpose, which may be granted by the Minister of Customs.

(2) The Minister of Customs shall issue such license to any foreign-built British ship, whether registered in Canada or elsewhere, upon application therefor and upon the payment of a duty of twenty-five per cent ad valorem on the fair market value of the hull, rigging, machinery, boilers, furniture and appurtenances of such ship.

(3) This section shall not apply to any foreign-built British ship registered as a British ship prior to the first day of September, 1902.

3. No goods or passengers shall be carried by water, from one port in Canada to another, except in British ships; and if any goods or passengers are so carried, as aforesaid, contrary to this Act, the master of the ship or vessel so carrying them shall incur a penalty of four hundred dollars; and any goods so carried shall be forfeited, as smuggled; and such ship or vessel may be detained by the Collector of Customs, at any port or place to which such goods or passengers are brought, until such penalty is paid, or security for the payment thereof given to his satisfaction, and until such goods are delivered up to him, to be dealt with as goods forfeited under the provisions of the Customs Act.

4. The master of any steam vessel, not being a British ship, engaged, or having been engaged, in towing any ship, vessel or raft, from one port or place in Canada to another, except in case of distress, shall incur a penalty of four hundred dollars; and such steam vessel may be detained by the Collector of Customs at any port or place to or in which such ship, vessel or raft is towed, until such penalty is paid.

5. Penalties and forfeitures under this Act may be recovered and enforced in the manner provided by the Customs Act, with respect to penalties and forfeitures incurred under it, and as if imposed by it; and this Act shall accordingly be construed with reference to said Act, and as forming one Act with it, and all words and expressions in this Act shall have the same meaning as the like words and expressions in said Act.

6. The Governor in Council may, from time to time, declare that the foregoing provisions of this Act shall not apply to the ships or vessels of any foreign country in which British ships are admitted to the coasting trade of such country, and to carry goods and passengers from one part or place to another, in such country.

6-7 EDWARD VII., A. 1907

7. Where, by treaty made before the passing of 'The Merchant Shipping (Colonial) Act, 1869,' (that is to say before the thirteenth day of May, eighteen hundred and sixty-nine), Her late Majesty, Queen Victoria, agreed to grant to any ships of any foreign state any rights or privileges in respect of the coasting trade of Canada, those rights and privileges shall be enjoyed by those ships for so long as Her late Majesty agreed, or His Majesty the King may hereafter agree, to grant them.

8. Chapter 83 of the Revised Statutes is repealed.

LEGISLATION.

During the session of 1906, the following Acts were passed and assented to:—

An Act respecting the Harbour Commissioners of Montreal.

An Act respecting the powers of the Harbour Commissioners of Montreal.

An Act to provide for further advances to the Harbour Commissioners of Montreal.

An Act respecting the Harbour of North Sydney in Nova Scotia.

An Act respecting the Quebec Harbour Commissioners.

An Act to amend the Act respecting the Safety of Ships and the Prevention of Accidents on board thereof.

F. GOURDEAU, Lt.-Col.,
Deputy Minister of Marine and Fisheries.

DEPARTMENT OF MARINE AND FISHERIES,
OTTAWA, November, 1906.

APPENDIX No. 1.

ANNUAL REPORT OF THE CHIEF ENGINEER OF THE DEPARTMENT OF MARINE AND FISHERIES.

The Deputy Minister of Marine and Fisheries,
Ottawa.

SIR,—I have the honour to submit a report of the work done in the several services under the supervision of this office during the seven months ended June 30, 1906, with some progress reports of work carried on to November 1, 1906.

This embraces work done at departmental headquarters on the construction of lighthouses, lightships and fog-alarms, the supervision of construction and repairs of lifeboats; the administration of the vote for the removal of wrecks and obstructions in navigable waters; tidal and current surveys; and the publication, examination and correction of hydrographic charts; construction of and repairs to fish hatcheries and refrigerators; engineering points in connection with the construction and maintenance of fish-passes; supervision of surveys of oyster beds; examination of applications for foreshore, wharf and other lots as they affect the interests of navigation; preparation and publication of notices to mariners and hydrographic notes, &c.

STAFF.

There is a special staff appointed for the tidal observation work; the remainder of the work of the branch is attended to by the general staff of the office.

The great increase in the amount lately voted for construction of aids to navigation has thrown upon this office a great rush of additional work, and to meet the increased demands it has been necessary largely to increase the staff and also to modify the system of doing work. For this purpose resident engineers have been appointed in connection with two of the agencies, and assistants from the headquarters staff have been frequently detached for special work in connection with large undertakings. I wish again to testify to the satisfactory work done by the technical staff, and once more to allude to the energy of Mr. B. H. Fraser, who has assumed direction of all fog alarm installations and experiments, besides being actively engaged in supervising all construction work.

The following changes have been made in my staff:—

Mr. J. H. Dubuc was on January 17, 1906, transferred to the staff of the government shipyard at Sorel.

Mr. H. J. Alward, employed all season on construction work in Ontario, was on October 25 transferred to the staff of the resident engineer at Halifax.

Mr. F. McDonnell has been employed almost continuously on outside work, installing fog alarm machinery at new stations.

Mr. J. F. Murphy has been employed since June 12, 1906, as assistant to the resident engineer in the Maritime provinces.

Mr. E. R. Beckworth resigned his appointment on August 30, 1906, to accept the position of city engineer of Kingston, Ont.

On January 16, 1903, Mr. G. R. Cosky was transferred to the Montreal agency of this department.

Mr. H. de Miffonis was appointed an assistant engineer on December 15, 1905, at a salary of \$60 per month.

6-7 EDWARD VII., A. 1907

As foremen of works, the following have been employed:—

Mr. W. H. Brunel, exclusively on construction, and superintending ice-breaking operations, in Ontario, throughout the year; Mr. E. Corriveau, rebuilding lighthouses on the Ottawa river, during the summer season; Mr. M. J. Egan, since the opening navigation on construction work on L. Winnipeg and L. Ontario. Mr. F. Forster, only for a short time, making repairs to Lake Erie stations.

PERSONAL INSPECTIONS.

Personal inspections of construction work in progress have frequently been made during the year by Mr. Fraser and myself, and it is very desirable that such personal supervision of work should be extended as much as possible in the interests of efficiency. Examination of localities where work is proposed should always be made before the plans are prepared, and it is to be regretted, in the interests both of efficiency and economy, that the work, lately, has often been so much rushed as to prevent such preliminary inspections.

In April last, I was sent to British Columbia, with the special view of examining the west coast of Vancouver island, to report on precautions that could be taken to diminish the frequency of shipwrecks in that locality, and to improve facilities for rescue when future shipwrecks occur. I have made separate reports on new aids to navigation required, in compliance with which a first-rate lighthouse and fog-alarm station are now being erected on Pachena point, and the lighthouse board have considered and recommended further aids. A separate report on the need for a wireless telegraph installation was also submitted. I append hereto my reports on the need for a life-saving service, and on land communications.

REPORT ON LIFE-SAVING, WEST COAST VANCOUVER ISLAND.

OTTAWA, June 20, 1906.

To the Honourable
The Minister of Marine and Fisheries,
Ottawa.

SIR,—In accordance with your instructions, I made a very full inquiry into the possibility of improving the life-saving appliances on the west coast of Vancouver island.

As a preliminary to a discussion of the question it is desirable to draw attention to the very great natural difficulties to be overcome: difficulties that can scarcely be realized by any one who has not personally had experience of the shore to be protected. From port San Juan to Cape Beale, a distance of 35 nautical miles, the shore is almost perfectly straight, without a harbour or any place that a boat can land except in rare spots on the open shore under favourable conditions of weather. The rugged front of this stretch almost defies description. Rocky ledges rise abruptly into densely wooded mountains, with a tangle of underbrush that is practically impenetrable, and the shore line is cut by deep ravines that prevent progress along the shore; thus approach from landward as well as from seaward is practically impossible. West of Cape Beale is broken ground with hidden reefs in the entrance to Barkley sound, extending 15 miles farther. This forms the shore which vessels approaching the entrance to the Strait of Juan de Fuca meet almost at right angles. Winter gales, during the prevalence of which practically all the shipwrecks occur, are always southwesterly gales and blow almost directly on to the shore we are discussing, and when such gales prevail no small boat can either put off from the shore or make a landing on the shore throughout the whole stretch. Furthermore except for an Indian village at Clo-oose and for settlements inside of Barkley Sound there is hardly a living soul throughout the 50 miles of coast. I mention these points to indicate the initial difficulties in the discussion of any question of life-saving service.

SESSIONAL PAPER No. 21

The first step towards the inauguration of a life-saving service has been taken by the construction at Vancouver of a self-righting and self-bailing life-boat 35 feet long. In my opinion this boat must be supplemented by other boats of lighter construction, to be manned by smaller crews. A 35-foot life-boat is too heavy to be rowed to any great distance, and requires a crew of ten men and a coxswain. In the United States Life-saving Service no attempt is made to row these large boats. They are either towed to the scene of the wreck or are taken there under sail. In consequence of the fact that on the west coast of Vancouver island a boat must always work on a dead lee shore, sails would be of little use for this boat. She must depend on tow boats and oars, or, what I think would be far preferable, on a machine motor. Pending the completion of better arrangements I instructed Captain Gaudin, as per copy of letter herewith, to organize a crew in Victoria, and to have this crew drilled in the management of the boat.

Victoria is probably the only place where a crew of eleven men could conveniently be gathered. I think there will be no difficulty in securing men who have been trained in boating in the Royal Navy. Two good coxswains had already offered when I was in Victoria. If these men learn to use the boat efficiently she could be towed down the strait to where she may be wanted for service, or she could be established at Banfield creek with a regularly organized crew, as hereinafter recommended.

In the United States Life-saving Service and in our own Canadian service we have found the Beebe-McLellan surf-boat, of a light build and 26 feet long, self-bailing but not self-righting, manned by a crew of six men with a coxswain, to be far preferable for general service to a heavier boat, and in view of the conditions to be met in British Columbia, I would recommend the establishment of one of these Beebe-McLellan surf-boats at Clo-oose, one at Banfield creek and one at Uchuelet; with a fourth to be carried on the *Salvor* or on the *Quadra* if the *Salvor* is not available.

At Clo-oose there is an Indian village with a sand beach from which boats can be launched in moderate weather, and there are Indians there who are accustomed to face the rough waters of the Pacific in their dug-out canoes. I think a crew of six Indians, with a white coxswain to drill them and to take care of the station, might do efficient work, especially if the Indians were given a uniform and some little official recognition that would make them proud of the service.

At Banfield creek I should propose having a large life-saving station with quarters for the crew, and a regularly enrolled crew under an efficient coxswain to be kept there all winter; the coxswain to be left in charge of the station during the summer, when he could probably organize a volunteer crew from amongst the employees of the Pacific Telegraph line or local Indians. When this central station at Banfield creek is properly organized the life-boat now in Victoria should be removed to this place for permanent quarters.

At Uchuelet I should advocate the same arrangement as at Clo-oose.

The boat for the *Salvor* should be manned by the crew of the ship, who should be specially drilled in her management. The contractors to be paid for carrying this boat if the work is not covered by their present contract.

These suggestions I consider as preliminary arrangements, because I think that probably the most promising type of life-boat for this region would be a machine propelled boat, preferably equipped with a rather high powered naphtha engine. I have been making inquiries about these machine-propelled boats, and find that up to date they have been more or less experimental, and that difficulties have been encountered in fitting an engine that would fulfil the very difficult requirements of the life-saving service. The United States service have tried two or three boats of this type, and I should like authority to follow this matter up by visiting United States stations where there is a motor boat; and getting out a good design in collaboration with Mr. Newman.

If a suitable motor boat can be procured I should advocate establishing her at Banfield creek, where an absolutely sheltered harbour in a central locality can be had, and where the conditions seem most favourable for reaching probable wrecks in the shortest space of time.

6-7 EDWARD VII., A. 1907

If such a boat is established at Banfield creek I should advocate sending one of the other boat, already recommended for that station, to Clayoquot, where a crew could be organized under the same conditions as specified for Clo-oose.

With regard to line-throwing apparatus, the conditions are so absolutely unfavourable that I have little hope that any apparatus could be successfully used. The nature of the shore is such that no road can ever be built along it. This I have gone into at length, in my report on improvement of land communications, and I know no place along the 35 miles between Cape Beale and San Juan, where a line-throwing cart could be taken along the shore for a quarter of a mile. As a line must be thrown from a point immediately opposite the wreck, the conditions to be met are so difficult that I despair of any solution of the problem. However, for the sake of having the apparatus ready, in case a spot could be found from which a line could be thrown to a wreck, I recommend that two Lyle guns with complete sets of equipment be purchased, one set to be placed on the *Salvor* and the other set to be placed at Banfield Creek life-saving station. The crews in both cases to be trained in the use of the apparatus, and instructed to carry them, so that, if they could be landed where they would be available for throwing lines to wrecks, they might be used. Lyle guns, as used in our service and the United States service, are, in my opinion, preferable, for this work, to rockets.

The following is a synopsis of the above recommendations, with an estimate of the cost of the different items:—

ESTIMATE OF COST OF LIFE-SAVING SERVICE ON VANCOUVER ISLAND.

Service.	Construction.	Maintenance.
	\$ cts.	\$ cts.
At Victoria—		
35 ft. life boat built by Watts.....	600 00	760 00
Equipment for same.....	300 00	
Crew, coxswain.....		
10 men.....		
On "Salvor"—		
26 ft. surf boat.....	400 00	
Equipment of same.....	200 00	
Line throwing apparatus.....	650 00	
Crew, drill of men, &c.....		200 00
At Clo-oose—		
26 ft. surf boat.....	400 00	
Equipment for same.....	200 00	
Boathouse, say.....	400 00	
Crew, coxswain for year.....		500 00
6 men, 20 drills at \$150.....		180 00
At Banfield—		
26 ft. surf boat.....	400 00	
Equipment for same.....	200 00	
Line throwing apparatus.....	650 00	
Boathouse with living accommodation.....	2,000 00	
Motor life boat.....	2,000 00

Crew, coxswain for year.....		600 00
8 men for six months.....		2,400 00
At Ucluelet—		
Same as Clo-oose.....	1,000 00	680 00
At Clayoquot—		
Boathouse, say.....	400 00	
Crew, same as Clo-oose.....		680 00
Contingencies, inspection, &c.....	1,900 00	
Total.....	12,000 00	*6,000 00

*Annually.

The whole respectfully submitted.

WM. P. ANDERSON.

SESSIONAL PAPER No. 21

REPORT ON ROAD ON WEST COAST.

OTTAWA, June 20, 1906.

To the Honourable
The Minister of Marine and Fisheries,
Ottawa.

SIR,—I have the honour to report the result of my investigations in British Columbia into the possibility of and necessity for establishing a wagon road along the shore from Port San Juan to Cape Beale, as advocated by the public in connection with the *Valencia* disaster, made in accordance with your orders.

In the first place I would point out that any one who advocates a road along this coast has never traversed it and can have no idea of the physical difficulties to be overcome. It is not too much to say that the construction of such a road is a practical impossibility, with any reasonable expenditure. Although the coast is approximately straight in its general direction, it must be remembered that the mountains of Vancouver island come down to the shore line, and what looks like even land from the deck of a vessel a mile out, proves, when one lands on it, to be cut up by ravines and hills, into a surface so uneven that it is impossible to build a road on it. The common error is to lose sight of the very large scale on which everything exists on that coast. The height of the hills, the size of the trees, the denseness of the underbrush, the depth of the ravines and the roughness of the rocks are all dwarfed by the large scale of the whole coast scheme, and it is only when one attempts to traverse the country on foot that one realizes the impossibility of contending with the gigantic difficulties encountered. I consulted the men having the most intimate practical knowledge of these conditions; the officials of the Pacific Cable Company, at Banfield Creek; Mr. Patterson, the lightkeeper at Cape Beale; Mr. Logan, the lineman on the government telegraph line at Clo-oose; the Messrs. Daykin, who helped to build the telegraph line and who have had twenty years experience on that shore; Mr. Joseph Williams, lineman at Port San Juan; the Rev. Mr. Ellison, who was at one time lineman on the telegraph line; Mr. Wm. Henderson, resident engineer of the public works at Victoria, and Mr. Brown, his assistant, who have charge of the telegraph line, and inspect it from time to time; Captain Gaudin, our agent, and Captain Walbran; and I can refer to all these authorities to endorse my opinion, that a roadway close to the shore is impracticable.

I am, however, of opinion that existing conditions can be improved. The trail that follows the government telegraph line from Port San Juan to Cape Beale is with difficulty passable by men on foot with the assistance of wire ladders down the sides of some of the worst ravines, and with the assistance of wire cables over some of the mountain torrents. In my opinion, this trail ought to be brought as close to the coast as practicable, throughout its length, and the improved line ought to be brushed out and cleared, so that ship-wrecked mariners could follow it easily to the nearest point where they could get relief, and roads should be cut from the main trail to the shore at intervals so that men cast ashore, could find their way. I doubt if the trail could be made available as a wagon road. I understand that the hills are too bad to admit of the use even of pack animals. Another difficulty is the fact, that the underbrush, consisting chiefly of sal-lal bushes, grows so rankly and so thickly that it is necessary to cut it every year to keep a trail open. As, however, such a trail is the only possible way of getting through the country, it seems very desirable that the present trail should be cut out and improved as much as possible.

For the purpose of watching the coast during the winter months, I would advocate at the shore ends of some of the roads cut from the main trail to the shore, the erection of huts, with a man established as a lookout in each of them, whose duty it would be to give warning of vessels in danger. These huts should be stationed on the most prominent headlands, and if located about six or seven miles apart they would command the whole shore line. Obviously these huts should be connected by telephone with Cape Beale or Port San Juan, and through them with Victoria. The lookouts could also

6-7 EDWARD VII., A. 1907

act as additional linemen, and should be supplied with provisions and clothing for the shipwrecked. I found a good deal of complaint about the present working of the government telegraph service. Some parties claim that the Canadian Pacific Railway Company, who now operate the Victoria office on the line, attend to this service only when they have nothing else to do, and that calls are neglected for hours at a time, further, that they do everything possible to divert business to their own line via Alberni to the prejudice of the government line. The neglect complained of is possibly dictated by this policy. I find, moreover, that the operators on the line are very strongly in favour of changing it from a telegraph line to a telephone line. They claim that when the line is grounded by the falling of a tree, as very frequently happens, a telephone message can be sent over when a telegraph message cannot pass. Mr. Keeley tells me that this statement is not scientifically correct. I am only giving the popular opinion locally expressed, which is unanimously in favour of making the line wholly a telephone line.

It seems evident that more money should be spent on this line to keep it efficient. It now costs over \$6,000 per annum and produces practically no revenue. I think the expenditure on the line should be doubled if it is desired to make it efficient as an aid to navigation and a protection to life and property. I should advocate putting in telephones at the several additional stations I have suggested above, putting on additional linemen, and if necessary making the whole system independent of the Canadian Pacific Railroad telegraph service. I think that the extra expense involved should be charged to the Marine Department and not to the Government Telegraph Service, which now as a telegraph service fulfils the ends for which it was established.

I append a plan of the line from Port San Juan to Carmanah, showing additional stations recommended, showing changes in the location of the line suggested by the linemen and also a rough estimate of the cost of this work. This estimate, however, may require very marked revision.

ESTIMATE OF COST OF IMPROVING TELEGRAPH TRAIL, ESTABLISHING LOOKOUTS, ETC.

Diversion of trail from Port San Juan to Seven-Mile river ..	\$ 600
Hut at or near Seven-Mile.	200
Improving trail to Carmanah.	100
Improving trail to Clo-oose.	100
Hut west of Indian village.	200
Hut west of Shelter light	200
Improving trail to Cape Beale.	200
Cutting roads to shore and underbrushing	500
Installing three extra telephones	300
Equipment for huts and incidentals.	800
Three extra men at \$50 per month.	1,800

Estimate for this year. \$5,000

I also append for permanent reference the considerable correspondence I have had on the whole subject.

WM. P. ANDERSON,
Chief Engineer, Dept. of Marine and Fisheries.

OFFICE WORK.

A large proportion of the work done by the general staff of the branch consists in the construction, repair or improvement of light buildings, fog alarms, beacons and other aids to navigation. Full details of the work done in this connection during the past twelve months are contained in a separate report which is attached hereto. (Inclosure A.)

SESSIONAL PAPER No. 21

Plans and specifications for all important new buildings and repairs, new vessels, &c., are made or approved in this office.

The following table indicates the work done in the drafting office during the eleven months ended October 31, 1906:—

Description of work.	Plans designed.	Plans received.	Copies made.
Lighthouse towers and dwellings.....	34	22	133
Fog alarm buildings.....	8	31
Detail sheets for above.....	20	13	84
Wharfs, piers, &c.....	6	6	7
Outbuildings.....	1	1	24
Buoys and apparatus.....	19
Machinery.....	1	37	7
Lanterns.....	1	4	1
Fish hatcheries.....	2	2
Marine hospitals.....	1	1
Steamers.....	3	2
Land surveys.....	1	60	43
Charts under construction.....	1
Plans relating to foreshore.....	2	224	14
Miscellaneous.....	4	92	122
Total.....	81	463	496

Total plans for eleven months from December 1, 1905, to October 31, 1906.....	1,034
Charts received and recorded.....	160
Charts received and entered in chart books.....	16
Photographs received and recorded.....	211
Specifications written.....	32
Notices to mariners issued (comprising 332 subjects).....	134

PUBLICATIONS.

The work of preparing and issuing notices to mariners continues to be heavy and urgent, during the past seven months 88 notices, covering 178 subjects, having been published. Amongst important notices, involving considerable labour in compilation, and representing useful work done in the department, are:—

An index to last year's notices ; hydrographic notes respecting uncharted dangers in Stuart and Trincomali channels; time of tide and slack water in the strait of Georgia; description of buoyage in Nicolet Traverse and Pointe du Lac; and buoyage at Blind River.

In the preparation of notices to mariners, I wish to testify to the faithful and accurate work done by Mr. J. M. O'Hanly, who assists in this branch of the routine work.

During the past seven months notices relating to waters outside of Canada were issued, covering 3 items relating to Newfoundland and the French islands, 2 items relating to the Atlantic, 4 to the inland, and 8 to the Pacific waters of the United States, as well as 10 notices referring to transatlantic, and 3 to transpacific, subjects. No attempt is made to issue a complete synopsis of British or foreign notices, but merely to republish items likely to be of immediate interest to Canadian vessels, or to vessels leaving Canadian ports for the more important or frequented foreign ports.

REMOVAL OF OBSTRUCTIONS.

During the past seven months the following work was done, under the annual appropriation for the removal of wrecks and obstructions:—

The wrecked barge *Tasmania*, which sank in the vicinity of Pelee island, Lake Erie, mentioned in last year's annual report, has been removed by contract, the owner having failed to do so. The contractors were the Midland Towing and Wrecking Co., of Midland, Ont., and the contract price, \$3,900.

The owners of the schooner *Pearl* (which was sunk in the bed of the Shepody river, near Harvey, N.B., mentioned in last year's annual report), having failed to remove the obstruction, a contract was let for its removal to Mr. John P. Dunn, of Albert, N.B., the contract price being \$1,000.

The schooner *Armenia*, sunk about three and a half miles from Pelee Passage lighthouse, Lake Erie, in May last, having been abandoned by the owners, a contract has been let to the Midland Towing and Wrecking Co., of Midland, Ont., for its removal, the contract price being \$5,850.

The schooner *Ripple* was burned and sank in Port Bickerton, in November, 1905, and the owners failing to remove her, a contract was let to Messrs. Beazley Bros., of Halifax, N.S., to remove this obstruction, the contract price being \$800.

HYDROGRAPHIC WORK.

The hydrographic surveys of this department are now in charge of Mr. W. J. Stewart, who will make a special report of the year's progress.

All hydrographic notes reaching the department are prepared for publication in this office, and embodied in notices to mariners.

In preparing notices to mariners, special attention has been paid to publishing all information obtainable respecting the hydrography of Canada, and the fullest possible sailing directions have been appended to all descriptions of aids to navigation, so as to increase the value of these notices. During the past seven months the following hydrographic notes were published:—

Affecting the Atlantic coast.—Notice of resumption of government target practice at McNab island, N.S.; sinking of schooner *Alexander R.* and subsequent raising of same near Reid Rock shoal, N.S.; wireless telegraph station established at Camperdown heights, N.S.; breaking up of wrecks of SS. *Damara* off Jeddore head, and schooner *Ida M. Schaffner*, off Isaac harbour, N.S.; and corrected position of buoy, Charlottetown harbour, P.E.I.

Gulf and River St. Lawrence.—Tidal and current survey steamer in Strait of Belle Isle; telegraph cable between Crane island wharf and the south shore; re-arrangement of bouyage between Nicolet Traverse and Pointe du Lac, P.Q.; and publication by the department of hydrographic charts, St. Lawrence river, No. 3 (Ile à l'Aigle to Ile Marie); No. 4 (Ile Marie to Ile Bouchard); No. 5 (Ile Bouchard to Ile St. Ours); and No. 6 (Ile St. Ours to Ile aux Foins).

Inland waters.—Hydrographic note concerning bouyage, &c., at Blind river; limit of rate of speed for vessels in Toronto harbour; and lighting of wreck of schooner *Armenia* sunk near Pelee passage.

Pacific coast.—Information respecting dangers in Stuart and Trincomali channels, supplied by Capt. J. F. Parry, R.N., of H.M.S. *Egeria*; information respecting time of slack water and tide in the Strait of Georgia; uncharted rock in Pender harbour, from information supplied by Capt. H. Newcomb, C.G.S. *Kestrel*; and establishment of fishing traps in Strait of Juan de Fuca.

TIDAL AND CURRENT SURVEY.

In this survey exceptional progress has been made in the tidal branch during the past year; and the information added to the tide tables has been so large as to necessitate remodelling their form.

As the C.G.S. *Gulnare* was used for the work of the hydrographic survey during the season of 1905, and the cost of its maintenance charged to that service, a substantial margin of the tidal service vote was left free, which has been expended on the reduction

SESSIONAL PAPER No. 21

of tidal record. Some part of the arrears has thus been overtaken, and an important advance in the improvement of the accuracy of the tide tables has resulted.

During the present season the investigation of the currents has been carried on, the region chosen being Belle Isle strait. Dr. W. B. Dawson, engineer in charge of the survey, gave his personal supervision to this work from May to September, assisted by Mr. S. C. Hayden, and two temporary assistants for the night work. The inspection and repair of the tidal stations on the Atlantic coast was entrusted to Mr. H. W. Jones; and the supervision of the tidal record to Mr. R. Angus, who also attended to the office work during the summer months, at headquarters in Ottawa.

Investigation of the currents.—In this the C.G.S. *Gulnare* was employed, as well as the schooner *Laura*, which was chartered for the season. This schooner was anchored by suitable moorings at a carefully selected point in the narrowest part of Belle Isle strait, the object being to ascertain the time of the turn of the current with relation to the tide. The observations were made continuously day and night, so far as weather permitted. A continuous record of the tide, for comparison with the current, was obtained at Forteau bay in the strait; from the permanent tidal station which has been in operation there for a number of years. With these arrangements it was hoped that the surveying steamer would be free to investigate the more general problems which the current presents. The weather proved to be unusually broken, however, and the behaviour of the current was such that it was found necessary to confine the work of the steamer more specially to the central part of the strait, to obtain the class of information which is of most practical importance to shipping.

This strait is almost equal in importance to the St. Lawrence itself, in the volume of traffic which it carries during the season of navigation. It is also noteworthy that practically the whole traffic is now done by steamships, only one square rigged vessel being seen during the season. The only sailing vessels in the strait are schooners and fishing boats.

The observations made on the *Gulnare* were continuous day and night. There was considerable interruption, however, on account of the conditions met with. These were: (1) Very poor holding ground, the bottom of the strait consisting apparently of the smoothest rock throughout. (2) A sea rises very quickly when a wind springs up, as the depth of the strait is only 30 or 40 fathoms. (3) The weather was very changeable and uncertain during the season; although there were few really heavy gales. Consequently, in the strong currents and short choppy waves of the strait, the vessel would drag anchor as soon as the waves attained any strength, even with a large scope of hawser relatively to the depth.

Some time was lost because of bad weather in June, at the beginning of the season; and later the usual interruptions occurred in coaling and obtaining supplies. The amount of work done from the middle of June to the end of September was as follows, when the time is divided into even weeks, and one week is omitted in August for cleaning boilers—

June 17 to 30—two weeks	225 hours.
July 1 to 28—four weeks	329 hours.
July 29 to September 1—four weeks	380 hours.
September 2 to 22—three weeks	139 hours

The number of days between these limiting dates is 78, with the omission of Sundays and the week referred to, and the total number of hours, day and night, is 1,872. The work done while at anchor, when the direction and strength of the current was measured every half hour, was thus 57 per cent of the total time at 24 hours to the day; which on the average is nearly equivalent to 14 hours per day of uninterrupted work.

It will not be necessary to enter here upon any description of the behaviour of the currents in Belle Isle strait, as a detailed report on this will be prepared. The

information resulting will be of important value to shipping. The results first ascertained when this survey was begun, are of great importance to mariners, as they disprove the incorrect idea which is still difficult to dispel, that the current runs constantly inward through Belle Isle strait towards the gulf. It is clear that such an error is very misleading to vessels, especially on the inward course in their reckoning to round Anticosti.

Tidal Stations and Tide Tables.—The principal tidal stations on the St. Lawrence and Atlantic coasts have been maintained in continuous operation throughout the year, and on the Pacific, six of the tidal stations recently established have been maintained. These are situated at points of the greatest strategic importance to obtain a comprehensive basis for the tides of the whole coast of British Columbia. From north to south they are: Port Simpson, Bella Bella, Wadhams, in Rivers inlet; Port Hardy, Vancouver, and Clayoquot on the west coast of Vancouver island. In addition to these tidal stations the turn of the current is being observed in three of the passes which are most used for navigation, namely, Active pass, Porlier pass and First narrows, at the mouth of Vancouver harbour.

A large quantity of additional information has been obtained from these observation and other sources, by which the tide tables have been extended and improved in accuracy. The tide tables have accordingly been remodelled, and for 1907 they are issued in two sets, instead of three as formerly. One of these comprises the whole of the eastern coasts of Canada, and the other the Pacific coast.

Tide Tables for the Eastern Coasts of Canada.—In these, full tide tables are published for four of the principal tidal stations, Quebec, Father Point, Halifax and St. John, N.B., and also tables giving the time of the tide only, for Charlottetown, Pictou, St. Paul island and Yarmouth, N.S. From these tables, tidal information for all other harbours of importance in Eastern Canada can be found by means of tidal differences. There is also an outline of the character of the currents on the lower St. Lawrence, in the Bay of Fundy, and around Newfoundland, with reference to the steamship routes which traverse those regions.

The tidal information for the St. Lawrence is now very comprehensive. The time at which the strong tidal currents turn throughout the estuary, is given with reference to Quebec or Father Point. In particular the time of high and low water in Beaujeu channel, which is the shallowest point below Quebec, is readily found by means of a tidal difference, which has been determined with care. For the ship channel above Quebec, special tide tables are prepared for the two points which are the shallowest at low water until the deepening of the channel is completed throughout. These points at present are St. Augustin bar and Cap à la Roche; and the tide tables prepared are issued by the Montreal Harbour Commissioners in their publication for the Pilot service.

Tide tables for the Pacific Coast.—By a prompt reduction of the tidal record obtained at Port Simpson, complete tide tables are issued for 1907. This is of special importance, as the time of slack water in Seymour narrows can be referred to that port with greater accuracy than to the distant harbour of Sitka. This advantage has been secured by making fresh reduction of the data for Seymour narrows which already existed. The time of slack water in the other navigable passes is similarly found from the other ports of reference.

Complete tide tables are now published for Victoria, Sand Heads in the Strait of Georgia, and Port Simpson. The tidal observations obtained by the Admiralty surveying steamer *Egeria*, since 1899, have afforded differences with these ports of reference for many localities in addition to those obtained by this survey. In all cases, the tidal information published is based upon actual observation at the localities in question, and nearly all of these given in the tide tables for 1907 are new. They are as follows. Referred to Sand Heads: New Westminster, Vancouver, Port Moody, Active Pass, Telegraph Harbour, Chemainus, Ladysmith, Porlier Pass, Gabriola Pass, Percy

SESSIONAL PAPER No. 21

anchorage, Dodd narrows, Nanaimo, Departure bay, Hammond bay, Nanoose, Union, Comox, Mitlenatch island off Cape Mudge and Quathiaska. Referred to Port Simpson: Nymphe Cove in Seymour narrows, two localities in Johnston strait, Alert bay, Blunden harbour, Port Hardy, Wadhams in Rivers inlet, Bella Bella and Lowe inlet.

Accuracy of the Tide tables.—The accuracy of tide tables is represented by the length of the tidal observations on which they are based. The following list thus shows in order of accuracy, the tide tables issued by this survey in their relation to tide tables published by the United States Coast survey for the more important harbours of the Atlantic and Pacific coast respectively.

Eastern coasts—

- Halifax, N.S. Based on nine years of tidal observations.
- Quebec. Based on eight years of tidal observations.
- St. John, N.B. Based on eight years of tidal observations.
- Sandy Hook. Based on eight years of tidal observations.
- Father Point. Based on six years of tidal observations.
- St. Paul island. Based on four years of tidal observations.
- New York. Based on three years of tidal observations.
- Philadelphia. Based on two years of tidal observations.
- Boston. Based on one year of tidal observation.
- Portland. Based on one year of tidal observation.

Pacific coast—

- Sand Heads, Strait of Georgia. Based on six years of tidal observations.
- San Francisco, California. Based on four years of tidal observations.
- Victoria, Strait of Fuca. Based on three years of tidal observations.
- Port Townsend, Puget Sound. Based on three years of tidal observations.
- Astoria, Columbia river. Based on two years of tidal observations.
- Port Simpson, Northern B.C. Based on two years of tidal observations.
- Sitka, Baranof island, Alaska. Based on one year of tidal observation.

Tide levels.—The main object of this survey as a branch of the Marine Department is to deal with the time of the tide; since this is a matter of chief importance to navigation, and the question of levels is quite secondary. But the value of reliable levels, which can only be obtained from tidal observations, makes it seem right to take the additional trouble necessary to secure them. Such levels are essential in the construction of wharfs for dredging and other harbour improvements, and in city works.

In the cities of British Columbia, the levels were found to be in a state of confusion, and the problem of reducing them to a uniform basis in relation to the tide, was taken up when the coast was visited last season. The results have been published as a supplement to the last Annual Report of the Department.

The levels in the cities and towns of the Pacific coast are thus brought into orderly arrangement; and being referred to permanent bench-marks, they are always available for future reference. The places chiefly benefited by this work are Victoria, Esquimalt, Vancouver, New Westminster, Nanaimo and Port Simpson. The levels at the new tidal stations are also given, as well as a complete list of bench-marks established by the Admiralty surveyors as far north as Queen Charlotte sound, which serve to define the low-water datum of the charts in the surveys now concluded in that region.

ICE BREAKING IN THUNDER BAY.

In the autumn of 1904, the large harvest in the Northwest necessitated an extra effort being made to relieve congestion of freight by forwarding as much as possible

6-7 EDWARD VII., A. 1907

of the enormous quantity of grain by water before navigation closed, and this department undertook to keep the lights and other aids to navigation in operation to the latest possible moment to facilitate this movement.

It was also found necessary to carry out a system of ice breaking in the ports of Fort William and Port Arthur, which, being near the most northerly limit of lake navigation, are in danger of becoming frozen over earlier than other points on the traffic routes. The experiment made at that time was so successful that the scope of the work was enlarged in the following season, and tenders were called for a comprehensive system of ice breaking in both harbours which would enable all boats to enter and leave and move freely to and from their berths without hindrance from ice. The lowest tender was accepted, namely, that of The Canadian Towing and Wrecking Company at \$625 a day. The work necessitated the continuous employment of some six or seven tugs, including a powerful icebreaker, as, owing to the restricted area of these harbours, the ice had to be kept not only constantly broken but also removed in large quantities out into the bay so as to prevent regelation. The work was again successful, and Navigation was kept open until December 15 without difficulty. The amount paid under this contract was \$20,312.50.

In the spring of 1906 the harbours were again opened by means of an ice breaking tug, at a cost of \$3,800, and for the first time on record, navigation in Thunder bay was open ahead of Duluth. The results of this work have been so successful and the demands on the department for its continuance so many and so strong, that it is the intention to continue the work in future.

Respectfully submitted.

WM. P. ANDERSON.

OTTAWA, Ont., November 28, 1906.

(INCLOSURE A.)

DETAILED REPORT OF THE CHIEF ENGINEER OF THE DEPARTMENT OF MARINE AND FISHERIES ON CONSTRUCTION, ESTABLISHMENT AND IMPROVEMENT OF LIGHTHOUSES AND OTHER AIDS TO NAVIGATION UP TO JUNE 30, 1906.

To the Deputy Minister,
Department of Marine and Fisheries,
Ottawa.

SIR,—I have the honour to submit a detailed report on work done in the construction and establishment of aids to navigation for the seven months ending June 30, 1906.

In submitting the following report of work carried on by the construction branch of this department, I would draw attention to the fact that the last report of this nature included all the work completed and under way at the close of November, 1905. The working season was then completed and practically full reports of all work done during the season were in the department with details of the cost.

SESSIONAL PAPER No. 21

Owing to the late rising of parliament this season, no money was available for construction of aids to navigation until very late, and it will be necessary to continue the work later than usual in order to get much of it completed. For this reason, particulars are not fully to hand yet, and as the fiscal year is to close on March 31 next instead of June 30, the present report will only cover such work as was completed or under way on June 30 last. A list, however, will be given of any additional important work that has been put in hand since that time, but all work now uncompleted will be taken up in the next annual report and the usual details given. Any statement of cost given in the present report, unless otherwise stated, will refer to the amount expended between November 30, 1905, and June 30, 1906.

NOVA SCOTIA.

NEW AIDS TO NAVIGATION.

Brier island.—A new fog alarm building is in course of construction at this station, and is nearing completion. The boilers are installed, tanks placed inside the building and other work completed.

The steam whistle maintained at this station will, as soon as the building is completed, be superseded by a diaphone operated by compressed air, which will give 3 blasts of 3 seconds each, with intervals of 4 seconds between them, in each minute.

The work is being carried on by day's labour, under the direction of Mr. S. Montgomery, and cost to June 30, \$8,660.27.

Cranberry island.—A fog alarm was erected on the summit of the southern part of Cranberry island, and was put in operation on July 1, 1906. It is a square wooden building; the sides painted white and the roof red. The building stands about 1½ cables to the southward of the lighthouse and the old fog alarm building on the northern part of the island.

The fog alarm consists of a diaphone, operated by air compressed by oil engines, and gives during thick or foggy weather, one blast of seven seconds' duration every minute. The horn is elevated 29 feet above high water mark, and points S.S.E.

The work was done under the supervision of the Nova Scotia agency, and cost \$3,213.15. The machinery was furnished under contract by the Canadian Fog Signal Company of Toronto, for \$8,500.

CHANGES AND IMPROVEMENTS AT EXISTING STATIONS.

Mauger beach.—A new fog alarm building, erected at this station, is a square wooden building, painted white, with the roof red. The fog alarm was changed from the whistle formerly in use to a diaphone operated with air compressed by an oil engine. It gives one blast of 3½ seconds' duration every 30 seconds. The horn, elevated 37 feet above high water mark, projects from the south side of the lighthouse tower.

The work was done by day's labour, under the direction of the Nova Scotia agency, and the cost to June 30 amounted to \$7,993.86. The fog alarm machinery was supplied by the Canadian Fog Signal Company, of Toronto, and cost \$8,500.

McNab island.—The white, square wooden building, with a tower rising from the middle of its roof, from which the light on McNab island is shown, has had a red vertical stripe, five feet wide, painted down its seaward face from the lantern deck to the ground, to render it more conspicuous as a day mark when snow is on the ground.

Cape Race.—Both the fog alarm and lighting systems are undergoing extensive improvements, of which full details will be given in next year's annual report. The expenditure to June 30 was \$940.

6-7 EDWARD VII., A. 1907

In addition to the above items, minor repairs were executed at the following stations:—

Chebucto head.—Repairs to dwelling and fog alarm, \$1,020.32.

Betty island.—Repairs, \$53.87.

Cross island.—New boat; and repairs to dwelling and fog alarm, \$505.90.

Cape Fourchu.—Repairs to tower, \$69.11.

Apple river.—Repairs to fog alarm, \$176.64.

Egg island.—Repairs to boathouse and building, \$54.16.

In addition to the above, the following construction work is under way:—

Cape Sable, a new fog alarm building and installation.

Little Hope, repairs to dwelling and breakwater.

Mauger beach, tower being raised and breakwater rebuilt.

Bear island, a new lighthouse and protection work.

Cape North, a new fog alarm.

Pictou island, a new lighthouse at the west end.

Harbour island, a new lighthouse under construction.

Jordan river, a lighthouse to be built on the breakwater.

Grand Digue, a tower built to replace a mast light.

Dartmouth, work done on departmental wharf and depot.

Sambro, alterations to tower.

Scatterie, repairs to the light and fog alarm station.

Amet island, breakwater repairs.

Pope harbour, repairs.

Louisburg, repairs.

Wedge island, repairs.

Port Bickerton, repairs.

Bird island, repairs.

Ouetique, repairs.

Cap La Ronde, repairs.

Port Hood, repairs.

Caribou, repairs.

Three Top island, repairs..

NEW BRUNSWICK.

CHANGES AND IMPROVEMENTS AT EXISTING STATIONS.

Quaco.—A new wooden dwelling, with stone foundation, was erected about 150 feet westward from this station, for the use of the engineer. It contains six rooms, cellar and cement reservoir. Repairs were made to the road, and the fog alarm machinery was overhauled.

The work was done by day's labour, under the supervision of the New Brunswick agency, and cost \$2,280.

Partridge island.—The installation of the new fog alarm was completed. It consists of a diaphone, operated by air compressed by steam, and gives, during thick or foggy weather, through a resonator projecting from the southwest face of the building: two blasts each of 2½ seconds' duration every 30 seconds.

The work was done by the New Brunswick agency, and cost \$6,076.80.

The water system installed on the island, in connection with the quarantine system, was extended to the fog alarm, the work being done by the Department of Public Works, at the cost of this department.

SESSIONAL PAPER No. 21

Long Eddy point.—This fog alarm was, on August 1 last, changed, to sound, during thick or foggy weather, two blasts, each of $2\frac{1}{2}$ seconds' duration, every minute.

Passamaquoddy.—The lighthouse, on the east end of the eastern bar of Navy island, was moved 22 feet N., 47° E. from the steel pile foundation on which it was originally built on to a rectangular wooden cribwork pier, 54 feet long by 30 feet wide, and 23 feet high.

The crib was erected under the direction of the New Brunswick agency, and the total cost was \$6,478.30.

Tiner point.—This fog alarm was, on April 1, 1906, changed so as to sound blasts of 3 seconds' duration every 45 seconds. The road leading from the public highway to the fog alarm station was also repaired at a cost of \$100.

Richibucto harbour.—The range lights were shifted to suit a change in the channel across the bar, at a cost of \$72.

Point Lepreau.—The fog alarm diaphone was changed to sound blasts of $3\frac{1}{2}$ seconds, with intervals of $26\frac{1}{2}$ seconds.

Goose lake.—Extensive protection work is being carried out at this station; 185 feet of new work, 5 feet high and 9 feet wide, was built, and the northeast end was extended a further length of 100 feet towards the south. Cost to June 30, \$778.86.

Gannet rock.—General repairs are under way at this station. A new dwelling is in course of construction and the outbuildings are being improved. Cost to June 30, \$2,630.12.

Letite.—A new protection work was erected at the station, consisting of square hemlock timbers, 240 feet long, 9 feet wide and 7 feet high, well bolted and filled with ballast stone; the seaward side being rip-rapped to a height of 4 feet. An addition is being put to the dwelling house and the water reservoir is being cleaned and repaired. Cost to June 30 is, \$1,019.24.

Minor repairs were also executed at the following stations:—

Big Duck island, repairs to dwelling	\$554 97
Cape Jourimain, repairs to dwelling	125 00
Grand Manan, repairs to fog alarm	662 88
Grindstone island, repairs to fog alarm	114 14
Head harbour, new boiler and fittings	802 59
Miscou, new boiler and fittings	1,091 33
Pokuesudie, new shed	109 70

In addition to the above the following works are now under way:—

Escuminac, an improved fog alarm building and machinery to be supplied.

Cocagne, range lights to be established.

St. Andrews, the foundation of the east lighthouse extensively repaired.

Head harbour, tower, dwelling and reservoir being repaired.

Partridge island, new dwelling built for the assistant keeper.

Big Duck island, reservoir provided.

Buctouche, repairs.

Miscou, repairs.

Machias Seal island, repairs.

PRINCE EDWARD ISLAND.

NEW AIDS TO NAVIGATION.

Georgetown.—A light was established on the roof of the coal shed on the outer end of the Georgetown railway wharf.

The light, which is fixed red, elevated 23 feet above high water mark, and visible two miles, is shown from a square wooden lantern, painted white, on the roof of the coal shed. The sides of the coal shed are painted red.

Souris.—An open steel skeleton tower, 25 feet high, fitted to take an octagonal lantern, 4 feet in diameter, constructed in the department's shipyard, at Sorel, was furnished for this station, and is in course of erection. The cost of constructing the tower was \$650.

Indian point.—Extensive repairs are being made to the foundation.

CHANGES AND IMPROVEMENTS AT EXISTING STATIONS.

East point.—The fog alarm at this station was changed so as to sound one blast of 5 seconds' duration every minute.

Fish island.—An oil shed was erected at this station, the work being done by day's labour, at a cost of \$175.

Brighton.—A new cribwork block foundation was started for the front range lighthouse at Brighton beach. The work is being carried out under the supervision of the agent of the department at Charlottetown, of which full details will appear in next year's annual report.

ONTARIO.

NEW AIDS TO NAVIGATION.

Long point.—The installation of the new fog alarm was completed and the plant put in operation. The building is a rectangular, wooden one, the sides painted white and the roof red. The alarm consists of a diaphone, operated by compressed air, and gives, during thick or foggy weather, through a horn projecting from the south face of the building, one blast of 3 seconds' duration every 30 seconds. The horn is elevated 20 feet above the level of the lake. This fog alarm replaces the steam horn heretofore used. Cost to June 30, \$6,633.13.

Gravenhurst narrows.—A lighthouse tower was erected on the southeast point of Denison island, at the site of the old pole light, and the pole and shed were removed. The tower is an inclosed, square wooden building, with sloping sides, surmounted by a square, wooden lantern, the whole painted white. It is 27 feet high from its base to the top of the ventilator on the lantern, and rests on a masonry foundation 4 feet high. The light is a fixed white dioptric light of the sixth order, elevated 28 feet above the level of the lake, and visible seven miles from all points of approach by water.

The work was done under contract by Mr. G. Brown, of Bracebridge, Ontario, at a total cost of \$701, the contract price being \$650.

Kitchener island.—A light was established on the northwest extremity of Kitchener island. The light is a fixed white light, shown from an anchor lens lantern hoisted on a pole, which stands on land $1\frac{1}{2}$ feet above the level of the lake and 130 feet back from the water's edge, and is elevated 40 feet above the level of the lake, and visible 11 miles.

SESSIONAL PAPER No. 21

The material for this light, together with the apparatus, was supplied from the Dominion Lighthouse Stores at Prescott.

Welcome islands.—A lighthouse was erected on the northeast extremity of the eastern Welcome island, and the light was put in operation on the opening of navigation in 1906. The lighthouse stands on land 80 feet above the level of the lake and 150 feet back from the water's edge. It consists of a square wooden dwelling, with an octagonal wooden lantern rising from the middle of its hip roof. It is painted white, with the roof red and is 38 feet high from its base to the top of the ventilator on the lantern. The light is a fixed white dioptric light of the seventh order, elevated 112 feet above the level of the lake, and visible 16 miles from all points of approach by water.

The work was done by day's labour under the direction of Mr. W. H. Brunel, the total cost being \$4,657.39.

George island.—A lighthouse was established on the eastern extremity of George island, lake Winnipeg. The tower stands on land 6 feet above the level of the lake and 100 feet back from the water's edge. It consists of an open steel skeleton frame, square in plan, with sloping sides, painted red, surmounted by a wooden watchroom and an octagonal wooden lantern. The watchroom and the lantern are painted white. The tower is 64 feet high from its base to the top of the ventilator on the lantern. The keeper's dwelling stands 150 feet westward of the lighthouse. It is a rectangular wooden building, painted white. The light shown is a fixed white dioptric light of the seventh order, elevated 66 feet above the level of the lake, and visible 13 miles from all points of approach by water, except in the line of islands and shoals extending north westward from George island.

Tenders were first called for this work, and the lowest tender submitted was \$4,900, but being considered too high, the work was, with steelwork provided in addition, carried out by day's labour, under the direction of Mr. M. J. Egan, and cost \$3,128.10, exclusive of the steelwork, which was built in the government shipyards at Sorel, and cost \$600.

In addition to the above, the following works are now under way:—

Arnprior, new lighthouse on concrete foundation pier.

Boyd island, breakwater.

False Ducks, duplicating fog alarm machinery and rebuilding dwelling.

Mississagi, replacing fog horn by diaphone.

Midland, new foundation to back range lighthouse.

Presqu'Île, fog alarm and machinery.

Penetanguishene, lighthouse tower and crib rebuilt.

Sulphur island, lighthouse rebuilt.

Saugeen, foundation repaired and tower moved.

Red rock, breakwater rebuilt and repairs.

Burlington, repairs to foundation of front range light.

Black Bear island, repairs.

Gull harbour, repairs.

Point Pleasant, repairs.

Red river, repairs.

CHANGES AND IMPROVEMENTS IN EXISTING AIDS.

Toronto.—A lighthouse tower was erected on the inner end of the east pier, eastern entrance to Toronto harbour on the site formerly occupied by an iron column and hexagonal shed, from which the back light of the eastern entrance range was shown, and which have been removed. The tower is an enclosed square wooden building, with sloping sides, surmounted by a square wooden lantern. The building is painted white and the lantern roof red. The tower is 22 feet high from its base to the top of the

ventilator on the lantern. The light is a fixed red dioptric light of the seventh order, elevated 27 feet above the level of the lake, and is visible six miles from all points of approach by water.

The work was carried out by the Department of Public Works and cost \$914.79. The fog alarm machinery was overhauled and improved and a low pressure diaphone installed at a cost of \$517.87, the diaphone being supplied by the Canadian Fog Signal Company of Toronto.

Port Colborne.—In connection with the extension and improvement of Port Colborne, it was necessary for the main lighthouse on the head of the old breakwater pier on the west side of the old entrance, to be taken down. To provide a light to replace this old main light, three electric arc lights, of 2,000 candle-power each, were established on the Grand Trunk Railway elevator, which stands on the east bank of the Welland canal, 1,200 feet south of the entrance lock. The lights are in a vertical line 3 feet apart, elevated 78, 81 and 84 feet respectively above the water, and are suspended from the wall of the elevator. They are 5,540 feet N. $17\frac{1}{2}^{\circ}$ E. from the light on the end of the west breakwater, and with it mark the same alignment that was previously marked by the breakwater and main lights.

Collingwood harbour.—The lighthouse at the turn of the dredged channel in Collingwood harbour was removed to a new square cribwork pier, distant 191 feet N. 38° W. from the old pier, and 2,500 feet N. 50° W. from the northwest corner of the Grand Trunk Railway freight shed wharf. This light constitutes the front light common to two ranges, one range leading into the curve in the dredged channel, and the other leading from the curve of the dredged channel to the Grand Trunk Railway freight shed wharf. The tower is a square wooden building with sloping sides, painted white, surmounted by a square wooden lantern painted red. The tower is 27 feet high from its base to the top of the ventilator on the lantern. The light is a fixed red dioptric light of the sixth order, elevated 29 feet above the level of the lake, and visible 7 miles in the alignment of the outer and inner ranges.

The back tower of the outer range stands on the mainland, 76 feet back from the water's edge, and 2,644 feet S. 4° W. from the front tower. The tower consists of a galvanized skeleton steel frame, square in plan, with sloping sides, surmounted by an inclosed wooden watch-room painted white, and a square wooden lantern painted white. The tower is 63 feet high from its base to the top of the ventilator on the lantern. The light is a fixed red catoptric light, elevated 58 feet above the level of the lake, and visible 8 miles in the line of range.

The back tower of the inner range stands on a square wooden cribwork pier, and is distant 1,530 feet N. 50° W. from the front tower. The tower is a square wooden building with sloping sides, surmounted by a square wooden lantern, the whole painted white. The tower is 39 feet high from its base to the top of the ventilator on the lantern. The light is a fixed white catoptric light. It is elevated 34 feet above the level of the lake, and is visible in the line of range. The character of the light shown from the lighthouse on the outer end of the western breakwater was changed from fixed red to fixed white, and was improved by the substitution of a fourth order dioptric illuminating apparatus for the catoptric apparatus formerly used.

The work was done by day's labour, under the direction of Mr. H. J. Alward, and cost \$8,678.20, exclusive of the galvanized steel tower which was built by Messrs. Goold, Shapley & Muir, of Brantford, and cost \$502.80.

Sault Ste. Marie.—The tower from which the back light of the Canadian Sault Ste. Marie canal lower entrance range is shown was moved back 206 feet in the line of range, and stands 1,356 feet N. $35\frac{1}{2}^{\circ}$ W. from the front tower. The tower was increased in height by 10 feet, and is now 82 feet high.

Thunder cape.—The improvements at this station were continued and the fog alarm strengthened by the substitution of a diaphone, operated by compressed air, for

SESSIONAL PAPER No. 21

the steam horn formerly used. The diaphone, during thick or foggy weather, gives one blast of 3 seconds' duration every 30 seconds. An extension, 20 feet long, was built to the east side of the fog alarm building.

The work was done by day's labour, under the direction of Mr. W. H. Brunel, and cost \$1,530.79.

AIDS TO NAVIGATION DISCONTINUED.

Blind river.—The range lights leading into Blind river, east of Susanne island, have been discontinued, being replaced by new lights farther west in the harbour.

Plunkett island.—The exhibition of the light from Plunkett island lighthouse, Lake Winnipeg, has been permanently discontinued, being replaced by the new light on Cox reef.

Salt point.—The exhibition of a light from Salt point lighthouse on the extremity of the sand spit at the entrance to Presqu'île bay has been permanently discontinued.

Collingwood harbour.—The light shown from two lanterns on the same pole, on the shore in the south part of this harbour, 330 feet S. 17° W. from the northwest extremity of Fleming's wharf, constituting the front light of the old shore range, and the light shown from two lanterns on a pole, on the south side of Second street, constituting the back light of the old shore range, have been permanently discontinued, being replaced by the permanent range lights hereinbefore described.

MONTREAL AGENCY.

River St. Lawrence ship channel.—The work outlined in last year's report has been continued as follows:—

The various works mentioned in that report as being uncompleted have been gone on with and various new works undertaken as follows:—At Ile du Moine new range lights are in course of construction to lead between the channels marked by the Ile de Grace range and the range at Ste. Anne de Sorel. At Gallia bay four permanent lights are under construction; these will form two ranges to lead around the curve at Pointe aux Soldats. At Nicolet a permanent range is being established to lead from that point to the curve at Pointe du Lac front pier, and a new lighthouse is being erected on Boat island to lead in from Lake St. Peter in line with the high light on Ile du Moine. A new range is being erected at Gentilly, the front tower placed on the batture on a solid ice-breaking foundation.

Owing to the late sitting of parliament this work was very late in being begun this season, and consequently a comparatively small proportion of the vote was expended before the close of the fiscal year on June 30, 1906, the total amount being \$51,373.92. In next year's annual report a full description of all this work, with detailed cost for the year, will be given.

The following important work was completed before June 30:—

Champlain.—On June 15, 1906, lights were shown from new range lighthouses, erected at Champlain, distant 50 feet to the southward of the alignment of the old range lights, and mark the axis of the ship channel from Champlain to Ile Bigot. The tower and the mast from which the old range lights were exhibited were removed.

The new front tower stands near the bank of the river, 158 feet N. 74½° E. from the old front tower, and about ½ mile above the village church. It is a square wooden building, surmounted by an octagonal wooden lantern, the whole painted white, and is 23 feet high from its base to the top of the ventilator on the lantern. The light is a fixed white catoptric light, elevated 34 feet above the summer level of the river, and visible four miles in the line of range.

6-7 EDWARD VII., A. 1907

The back tower stands 2,020 feet N. 56° E. from the front tower. It consists of an open steel framework, square in plan, with sloping sides, painted brown, surmounted by an inclosed wooden watchroom and a square wooden lantern. The upper portion of the framework facing the channel is covered with wooden slat work to render it more conspicuous as a day beacon. The lantern roof is painted red, the remainder of the lantern, the watchroom and the slats, are painted white. The tower is 92 feet high from its base to the top of the ventilator on the lantern. The light is a fixed white catoptric light, elevated 104 feet above the summer level of the river, and visible four miles in the line of range.

The steel tower for the back range was furnished by the government shipyards at Sorel, at a cost of \$600, and the total cost of labour and material in erecting this range, exclusive of steel tower, was \$890.47.

Cap Madeleine.—New towers were built for the lower range lights at this place, and the old range lighthouses taken down. The front lighthouse stands on the north shore, 400 feet back from the water's edge, 250 feet N. 83° W. from the site of the old front lighthouse, and 2½ miles below Cap Madeleine village church. It is a square wooden building, with sloping sides painted white, surmounted by an octagonal wooden lantern painted white with the roof red, and is 30 feet high from its base to the top of the ventilator on the lantern. The light is a fixed white catoptric light, elevated 51 feet above the summer level of the river, and visible 7 miles in line of range.

The back tower stands 2,880 feet N. 59° E. from the front lighthouse. It consists of an open steel framework, square in plan, with sloping sides, painted brown, surmounted by an inclosed wooden watchroom and a square wooden lantern. The side of the framework facing the channel is rendered more conspicuous as a day beacon by being covered half way down with wooden slatwork. The sides of the lantern, the watchroom and the slats are painted white, and the lantern roof red. The tower is 87 feet high from its base to the top of the ventilator on the lantern. The light is a fixed white catoptric light, elevated 108 feet above the summer level of the river, and visible 7 miles in the line of range.

This work was performed by day's labour, under the superintendence of the Montreal agency, and cost \$3,863.90.

Port St. Francis.—The front light of this range was moved 15 feet to the northward of its present position, to mark the axis of the widened channel through Batture au Fer and Poullier Laforce. The axis of the range now bears S. 78° W.

Sorel.—New towers were provided for the range lights on the wharf at Sorel on the sites of the old towers. They are steel skeleton towers, square in plan, with sloping sides, surmounted by square iron lanterns, the whole painted red. The lights shown are fixed red catoptric gas lights, visible one mile in the line of range.

The front tower is 35 feet high from its base to the top of the ventilator on the lantern, and the light is elevated 43 feet above the summer level of the river. The back tower on the S.W. corner of the Richelieu company's wharf, is 50 feet high from its base to the top of the ventilator on the lantern, and the light is elevated 59 feet above summer level of the river.

The steel towers were supplied from the government shipyards at Sorel, at a cost of \$600 each.

QUEBEC AGENCY.

NEW AIDS TO NAVIGATION.

Martin river.—The new fog alarm at this station was put in operation on August 10, 1906. The building stands 194 feet S. 70° E. from the old lighthouse, and 270 feet back from the water's edge. It is a rectangular wooden building with a high brick chimney and is painted red.

SESSIONAL PAPER No. 21

The fog alarm consists of a diaphone, operated by compressed air, and gives, during thick or foggy weather, one blast of five seconds duration every minute. The horn, elevated 70 feet above high water mark, projects from an extension at the north end of the fog alarm building and points N. 15° E.

A new lighthouse was also built near the site formerly occupied by the old lighthouse. It is an octagonal wooden building with sloping sides, surmounted by a circular iron lantern, the whole painted red, and is 63 feet high from its base to the vane on the lantern. The light is a flashing white light, showing four bright flashes of $\frac{1}{2}$ second duration each, separated by eclipses of $4\frac{1}{2}$ seconds, and followed by an eclipse of $14\frac{1}{2}$ seconds; the total period being 30 seconds. The light is elevated 130 feet above high water mark and visible 17 miles from all points of approach by water. The illuminating apparatus is dioptric of the third order, and the illuminant petroleum vapour burned under an incandescent mantle.

The completion of the installation was performed by day's labour and the cost was \$4,395.

Anse aux Gascons.—A light was established on the outer end of the wharf at Anse aux Gascons. It is a fixed red light, shown from an anchor lens lantern hoisted on a pole, and elevated 29 feet above high water mark, being visible 7 miles from all points of approach by water.

The structure was built in the department's workshops at Quebec and erected by the crew of the C.G.S. *Montcalm* at a total cost of \$80.60.

Belle Isle, north end.—The installation of the new fog alarm is being proceeded with, as well as the construction of the keeper's dwelling and other buildings.

The fog alarm building stands near the edge of the cliff at the north-east extremity of the island, and about 200 feet northeasterly from the light house tower. It is a rectangular wooden building painted red. The alarm consists of a diaphone, operated with air compressed by an oil engine, and gives, during thick or foggy weather, one blast of $3\frac{1}{2}$ seconds' duration every minute. The horn, elevated about 90 feet above high water mark, projects from the northeast side of the fog alarm building and points N. 66° E.

This work was performed by day's labour under the supervision of the Quebec agency and cost to June 30 \$1,545.71.

Natashkwan.—A lighthouse established in Little Natashkwan harbour was put in operation on July 1, 1906. The lighthouse stands on the west extremity of the island at the entrance to the harbour, replacing the beacon of skeleton steelwork formerly maintained there. It is a wooden tower, square in plan, with sloping sides, painted white, surmounted by a square wooden lantern, painted white, with roof red. It is 32 feet high from its base to the ventilator on the lantern. The light is a fixed white dioptric light of the seventh order, elevated 33 feet above high water mark and visible 11 miles from all points of approach.

The tower was erected by day's labour under the supervision of the Quebec agency and cost \$1,578.

Cape Anguille.—A new fog alarm station is in course of construction at Cape Anguille, the lumber, iron, framing material, &c., being purchased and on the spot. The work will be done by day's labour under the direction of the Quebec agency and has cost to date \$2,541.81.

Greenly island.—The work at this station was continued by day's labour, under the supervision of the Quebec agency, and cost to June 30, \$2,196.28.

Seven islands.—A new fog alarm is in course of construction on Carousel island, Seven islands. The work is being done by the Quebec agency and the cost to June 30 was \$5,366.

6-7 EDWARD VII., A. 1907

Rimouski.—A light was established on the roof of the freight shed on the wharf, near its outer end. It is a fixed white dioptric light of the sixth order, elevated 30 feet above high water mark and visible 10 miles from all points of approach by water. The light is distant 90 feet from the outer end of the wharf, and is shown from a square wooden lantern on the roof of the rectangular wooden freight shed; the walls and roof of the shed being painted dark red and the lantern white. The height from the top of the wharf to the top of the lantern is 21 feet.

The work was performed by day's labour and cost \$105.31.

In addition to the above the following works are now under way —

Caribou river—A steel back range tower is being built.

Grosse Roche—A combined lighthouse tower and dwelling is being erected.

Port Daniel, west—A lighthouse tower is under construction.

Poste St. Martin—New range light towers are being built.

Portneuf—Extensive repairs to the dwelling.

CHANGES AND IMPROVEMENTS AT EXISTING STATIONS.

Macquereau point.—A lighthouse tower was erected on Macquereau point, on the site of the old lighthouse destroyed by fire on August 30, 1905. The tower is an octagonal wooden building, with sloping sides, painted white, surmounted by a circular iron lantern, painted red, and is 51 feet high from its base to the vane on the lantern. The light is a triple flashing white light, which shows groups of three bright flashes with intervals of $2\frac{1}{2}$ seconds between flashes, followed by an eclipse of 10 seconds. The light is elevated 62 feet above high water mark, and is visible 13 miles from all points of approach by water. The illuminating apparatus is dioptric of the third order, and the illuminant petroleum vapour burned under an incandescent mantle.

A rectangular wooden dwelling, painted white, was erected near the lighthouse tower; a shelter shed was also built; and repairs made to the road.

The tower and dwelling were erected under contract by Mr. John Landry, of Gascons, Que., for \$3,800; the total cost of the work being \$4,545.05.

Cap Rosier.—The installation of the new diaphone fog signal plant, giving a blast of 7 seconds in every minute, was completed, and the alarm put in operation on August 1, 1906.

The work was done by Mr. Phillips, one of the department's erectors, the cost being \$206.

Fame Point.—The fog alarm work at this station is being continued by day's labour under the supervision of the Quebec agency; the cost to June 30, being \$3,587.

Cape Ray.—The steam fog horn was replaced by a diaphone operated by compressed air, which during thick or foggy weather gives one blast of five seconds duration every minute. The installation was completed, and the construction of a new dwelling begun; the cost to June 30 being \$3,853.

Cape Bauld.—The installation of the new plant was proceeded with, and the alarm will be put in operation before the close of the season. The work is being performed by day's labour, under the supervision of the Quebec agency, and cost \$914.

Bird rocks—The work of building a new landing at this station was completed, the total cost of labour and material (including cost of hoisting gear) amounting to \$1,239. Steps are being taken to replace the existing explosive fog signal by a modern compressed air plant which can be sounded more frequently than the present alarm. This should be in operation next season.

SESSIONAL PAPER No. 21

Cape Norman.—The installation of the new fog alarm plant at this station has been continued, and the alarm will be put in operation on the opening of navigation next year. The work, which is being performed by day's labour, has cost to June 30, \$437.

Amour Point.—The new fog alarm, mentioned in last year's annual report, was put in operation on the opening of navigation, this year. The building is of wood, rectangular, and the walls are painted white and the roof red. The horn elevated 40 feet above high water mark, points south and projects from the south end of the building. The alarm was changed from the whistle formerly in use, and consists of a diaphone, operated by compressed air. It gives, during thick or foggy weather, one blast of 7 seconds' duration every minute.

Anticosti (west end).—The protection work at this light station was thoroughly repaired, at a cost of \$904.76, the work being done by day's labour, under direction of the Quebec agency.

Father Point.—A new generator house was built at this station by day's labour, the cost being \$2,318.

Rivière du Moulin—New towers were built for these range lights. The towers are wooden buildings, square in plan, with sloping sides, surmounted by square wooden lanterns, the whole painted white. Each tower is 31 feet high from its base to the top of the ventilator on the lantern. The front tower stands in the alignment of the old towers, 200 feet N. 56° E. from the site of the old front tower. The light shown is a fixed white catoptric light, elevated 37 feet above high water mark, and visible two miles. The back tower stands 745 feet S. 56° W. from the front tower, and 145 feet back from the site of the old back tower, in the same line of range. The light shown is a fixed white catoptric light, elevated 79 feet above high water mark, and visible 2 miles in the line of range. The old towers have been taken down.

The work was done under contract by George Bergeron, of Chicoutimi, Que., the contract price being \$800, and the total cost \$1,005.17.

Upper Traverse.—The older portions of the sheathing are damaged every year by ice, and repairs were necessary. They were carried out by day's labour, at a cost of \$1,282.56. Owing to the exposed position and swift current the work is difficult and costly.

Pointe à Basile.—Extensive repairs were made to the road at this station. The locality is extremely rough and the work correspondingly difficult. The cost was \$1,445, and the work done by local labour, under the supervision of the Quebec agency.

Lightships.—On December 16 last the inspector of government steamers reported on the condition of the various lightships in the Quebec agency which were unfit to proceed to their stations without being thoroughly overhauled and repaired. This was carried out as follows :

Anticosti lightship No. 15—This lightship was furnished with over 100 new boiler tubes, and all leaking butts, rivets and seams were caulked ; the boilers were thoroughly cleaned and tested and painted with the best white zinc. The main stays were tightened up ; the gauge column mountings replaced by heavier ones ; the water tanks cleaned and cement washed, and all accessible portions of the hull in the engine room, stokehold, afterhold and chain locker painted with two coats of white zinc.

The cost of these repairs amounted to \$3,168.38, the boiler tubes being supplied by Messrs. Robertson & Co., of Montreal. The work was done under the supervision of the inspector of government steamers.

Red Island Lightship.—A great deal of new tubing was supplied, the boilers were thoroughly scaled and all non-heating surfaces painted with the best imported white

6-7 EDWARD VII., A. 1907

zinc paint ; the timing engine was renewed ; the cylinder of pumping engine was bored out and piston rings renewed ; the slide valves of the winch were overhauled and adjusted and the water tanks repaired.

The cost of these repairs amounted to \$1,141.13. The boiler tubes were supplied by Messrs Robertson & Sons, Ltd., of Montreal, and the work was carried out under the supervision of the inspector of government steamers.

Prince shoal lightship.—This vessel was scaled from stem to stem and painted with two coats of the best white zinc paint. A ballast tank in engine room was fitted to take the place of tanks in former use, and another ballast tank, 16 feet long, was provided aft, having connections to deck pump or boilers. The hull of the vessel was thoroughly repaired and all wood work removed from bulkhead to bulkhead, and frames renewed. The chain locker was scaled, and the boiler was tested and repaired. The windlass was put in first-class order and the heating plant thoroughly overhauled and renovated.

The cost of these repairs was \$11,690.56, the work being done under the supervision of the inspector of government steamers.

White island lightship.—A new boiler and fittings were provided for this lightship, the boiler being provided by Mr. Alex. McKay, of Quebec, at a cost of \$1,460. The cabin and crew's compartments were repaired and the lower deck and cabin sole planking was lifted and the vessel scaled throughout. A series of tanks, extending from bulkheads to bunker ends, were provided and the bulkhead renewed with $\frac{3}{8}$ inch and 5-16 in. steel plates. In the after end of vessel the tank was extended forward and a substantial bulkhead built across vessel. A complete stokehold and engine floor was built of steel plating and the vessel was thoroughly painted inside and out and all defective shell rivets removed.

The repairs and alterations to the hull and fittings were carried out by Messrs. G. T. Davies & Sons, of Levis, P.Q., the whole of the work being under the supervision of the inspector of government steamers. The total cost of this work, inclusive of cost of boiler, was \$13,927.

Minor repairs were executed at the following places :—

Cap au Saumon—Repairs to fog alarm buildings.....	\$ 285 02
Entry island—Repairs to station.....	61 50
Isle aux Raisins—Repairs to lighthouse.....	46 00
Kamouraska—Repairs to lighthouse.....	201 75
Lark islet—Repairs to dwelling.....	512 00
Montee du Lac—New lantern head.....	200 60
Port Daniel—Repairs to lighthouse.....	31 25
Perroquets—Repairs to station.....	103 96
Pointe Riche—Smoke stack, &c.....	127 50
Red island—Repairing tower.....	201 03

AID TO NAVIGATION DISCONTINUED.

Baie St. Paul.—The fixed white light, exhibited from the wharf in the middle of the bay, was permanently discontinued on January 1, 1906.

BRITISH COLUMBIA.

NEW AIDS TO NAVIGATION.

Amphitrite point.—A light was established on the extremity of Amphitrite point. The light is a fixed white light, elevated 60 feet above high water mark, and visible 13 miles from all points of approach by water. The light is shown through a dioptric

SESSIONAL PAPER No. 21

lens from a 31-day three-wick Wigham lamp placed upon the summit of a small square wooden tower, painted white, standing on a wooden framework foundation, and is unwatched.

The cost of establishing this light was \$141.54.

Swale Rock.—A light was established on Swale Rock. The light is a fixed white light, elevated 25 feet above high water mark, and visible 10 miles from all points of approach. The light is shown through a dioptric lens from a 31-day Wigham lamp placed upon the top of a small square inclosed wooden tower standing on a wooden framework foundation. The tower and the framework foundation are painted white. The light stands on the eastern end of Swale Rock, and is unwatched.

The cost of building the tower and installing the light was \$303.

Berens Island.—A fog bell operated by machinery was established on Berens Island, replacing the fog bell rung by hand heretofore used. The fog bell tower is a square wooden building, painted white, surmounted by a bell. The fog bell is elevated 20 feet above high water mark, and gives, during thick or foggy weather, one stroke every 5 seconds.

The cost of installing the same was \$173.

Sooke.—A light was established on the eastern extreme of Whiffen spit for the convenience of small craft attending the fishing traps in Juan de Fuca strait. The light is a fixed white light, shown from a lamp suspended from the arm of a wooden pole. The light is elevated 18 feet above high water mark, and visible 5 miles from all points of approach from seaward. It is unwatched and will be shown each year from March 1 to October 31.

Crofton.—For the guidance of vessels running to the Smelting Company's wharfs, a 31-day Wigham light was established on the southeasternmost of the Shoal islands forming the northern extremity of Osborn bay, and was put in operation on March 15, 1906. The light is fixed white, elevated 33 feet above high water mark, and visible 10 miles from all points of approach by water. The illuminating apparatus is dioptric of the seventh order. The lantern stands on top of a small square inclosed wooden tower, built on an open frame platform, 12 feet high, the whole painted white. It is maintained by the Britannia Smelting Company, and is unwatched.

The cost of erecting the tower and installing the light was \$244.

Denman Island.—A lighthouse tower was erected on the reef on the west side of Denman island, about $1\frac{1}{4}$ miles to the southward of Village point, and was put in operation on July 1, 1906. The tower stands on the reef, 250 feet out from shore. It is a square wooden building with sloping sides, surmounted by a square wooden lantern, the whole painted white. It is 27 feet high from its base to the top of the ventilator on the lantern, and stands on a concrete foundation 12 feet high. A foot bridge connects the lighthouse with the shore. The light is a fixed white dioptric light of the sixth order, elevated 23 feet above high water mark, and visible 7 miles from all points of approach by water.

A beacon was erected on the outer edge of the reef, 200 feet S. 45° W. from the lighthouse, and consists of a pole with a latticework drum on top, painted white, rising out of a concrete foundation.

This work was performed by contract, the contractor being Mr. D. Menzies, of Vancouver, B.C. The contract price was \$800, and the total cost \$1,479.90.

Trial Island.—A lighthouse and fog alarm are in course of construction on the southern end of Trial island, and the amount expended to date has been \$7,802.60.

Gallows Point.—A fog bell was established on Gallows point, Nanaimo harbour entrance. The fog bell tower is a square wooden building painted white, surmounted

6-7 EDWARD VII., A. 1907

by a bell; and the fog bell, elevated 20 feet above high water mark, is operated by machinery, which, during thick or foggy weather, gives one stroke every 5 seconds. The cost of establishing the same was \$122.

Egg Island.—A fog alarm was established at this station. The building is a rectangular wooden structure, painted white with a red roof, and is situated about 100 feet north of the lighthouse, on the summit of the small islet on the west side of Egg island, on which the lighthouse stands. The fog alarm consists of a diaphone operated with air compressed by an oil engine. It gives, during thick or foggy weather, one blast of 5 seconds' duration every minute.

The work was performed by day's labour, under the superintendence of Mr. John Montgomery, and cost \$7,170, exclusive of the machinery, which was furnished from the Canadian Fog Signal Company, of Toronto, at the contract price of \$8,500.

Pulteney Point.—A hand fog horn was supplied to the lightkeeper at Pulteney point lighthouse, which will be sounded in thick weather in answer to the fog whistles of steamers.

Green Island.—The lighthouse mentioned in last year's annual report as being in course of construction at this place, has been completed at a total cost of \$8,775.20.

Notice boards.—Notice boards, directing shipwrecked mariners and others to the nearest place where assistance is available, were placed in several places along the coast between Nootka island and Estevan point as follows: 4 in the vicinity of Nootka island, and 6 others along the coast in the vicinity of Estevan point.

In addition to the above the following works are now under way:

Cape Beale.—Rebuilding tower.

Kyuquot.—A harbour light is being established.

Quatsino.—A harbour light is being established.

Lucy island.—Dwelling and lighthouse.

Pachena point.—A new lighthouse and fog alarm are being erected.

Pine island.—A new lighthouse and fog alarm are being erected.

Porlier pass.—A dwelling has been authorized.

Virago rock.—A beacon has been authorized.

CHANGES AND IMPROVEMENTS AT EXISTING STATIONS.

Lennard island.—The fog alarm mentioned in last year's report as being under construction has been completed and work was done in making a safe landing for boats. All work was carried out under the superintendence of the British Columbia agency, and the total cost to June 30 was \$13,606.98.

Brockton Point.—The dwelling house at this station was repaired, the chimneys refashed and the exterior of the building renovated at a cost of \$212.

Prospect Point.—An additional room to the dwelling house at this station was built and the roof repaired, the cost of which amounted to \$242.85.

Carmanah.—The tramway at this station was repaired at a cost of \$270 and one of the fog alarm boilers was patched and retubed at a cost of \$480.

Fraser River.—Fraser river lightship, which broke away from her moorings on November 24, 1905, was replaced on her station on the Sand heads at the entrance to Fraser river. In addition to the light previously shown from the foremast head, a fixed white light is now shown from an anchor lens lantern at the mainmast head. Both lights are elevated 56 feet above the water and they are 29 feet apart.

Repairs were also made to the lightship, the garboards being recaulked, &c., the total cost of the above being \$651.

Respectfully submitted,

WM. P. ANDERSON.

November 1, 1906.

APPENDIX No. 2.

ANNUAL REPORT OF THE COMMISSIONER OF LIGHTS, 1906.

To the Deputy Minister of Marine and Fisheries.

SIR,—I have the honour to submit the third report of this branch to December 30.

In the year which has passed, the department has partially carried out the general plan laid down for the improvement of aids to navigation, by the substitution of improved optical apparatus in the lighthouses.

In some of the more important lights in the Gulf of St. Lawrence and Atlantic seaboard, the older catoptric apparatus has been changed and dioptric quick flashing characteristic lights have been installed; and when the system is complete, all the important coast lights will have been altered and improved.

Work is in progress in connection with the installation of three electric submarine signal stations in Nova Scotia and New Brunswick; and the station at Chebucto head, Halifax harbour, has been in successful operation for some time.

In the gas buoy work of the department, the most notable points are the elimination of the burner trouble in the automatic gas buoys, by the use of a special purifier, and the general extension of the service.

Reference was made, in the last annual report, to the necessity for a regular inspection of the contract buoy service, by technical officers, and a plan has been submitted for such inspection, from time to time, with a view to seeing that all buoys are in their correct position, properly painted and maintained and up to the standard.

The large increase in the number of aids to navigation, during the past few years, has caused a severe tax on the department's facilities for maintenance and inspection and at the present time, in different agencies, it is necessary for the department to charter steamers to carry out the buoy and lighthouse work. Permanent facilities should be secured with the least possible delay, in order that the work may not suffer.

The following improvements and changes have been made in the lights during the past year :—

PROVINCE OF QUEBEC.

Bryan Island.—When the light at Bryon island was established in 1905, it was necessary to install a temporary illuminating apparatus. This was a group revolving catoptric light showing three bright flashes with intervals of fifteen seconds followed by an eclipse of thirty seconds.

In September, 1906, this temporary light was replaced by the permanent apparatus, consisting of a third order dioptric light and lantern, giving four bright flashes at intervals of five seconds between the greatest point of brilliancy, followed by an eclipse of fifteen seconds.

The illuminant is petroleum vapour burned under a mantle and the apparatus was supplied by Barbier, Benard & Turenne, Paris, France.

Point Macquereau, P.Q.—On August 29, 1905, the light station at Point Macquereau, Chaleur bay, was destroyed by fire. The character of the old light was alternating white and red, one minute, apparatus revolving catoptric. The new apparatus is dioptric of 375 mm. focal distance (between third and fourth order) triple flashing consisting of two groups of three lenticular panels subtending 60 degrees each in the horizontal plane and 133 degrees in the vertical plane. In each semi-revolution of fifteen seconds the following flashes and eclipses are given, viz.:—

6-7 EDWARD VII., A. 1907

	Seconds.
1st flash.	0·35
Short eclipse.	2·15
2nd flash.	0·35
Short eclipse.	2·15
3rd flash.	0·35
Long eclipse.	9·65
	15 00

The new light went into operation on August 5, 1906.

The illuminant is petroleum vapour burned under a mantle and the apparatus was furnished by Barbier, Benard & Turenne of Paris, France.

Cape Norman, Straits of Belle Isle.—The department will, as soon as possible after the opening of navigation, 1907, erect at this station a segmental cast-iron tower, lantern and third order dioptric quick flashing light. The tower and apparatus are now at Quebec awaiting transportation to destination. The light will have the following characteristics, viz. :—

	Seconds.
1st flash.	0·525
Short eclipse.	5·475
2nd flash.	0·525
Short eclipse.	5·475
3rd flash.	0·525
Long eclipse.	17·475
	30·000

The apparatus is of 500 mm. focal distance, consisting of 8 panels, each panel subtending 72 degrees in the horizontal plane and 136 degrees in the vertical plane with catadioptric reflector of 600 mm. focal distance subtending an angle of 144 degrees.

The illuminant is petroleum vapour burned under a mantle. The apparatus was made by Barbier, Benard & Turenne, Paris, France.

A double flashing light was procured for this station but owing to the necessity of making Cape Bauld a double flashing light the characteristic of Cape Norman was changed to triple flashing, utilizing for the purpose the 3rd order triple flashing apparatus procured for Seal Island, N.S., the original apparatus being shipped to Quebec for Matane.

Greenly Island, Straits of Belle Isle.—On July 9, 1906, a second order dioptric single quick-flashing light was put in operation at Greenly island, replacing a catoptric group revolving light.

The apparatus is of 700 m.m. focal distance, consisting of 8 panels, each panel subtending a horizontal angle of 45 degrees and a vertical angle of 131 degrees. A complete revolution is made in 20 seconds with the following characteristic:—

Flash.	0·25 seconds.
Eclipse.	2·25 “
	2·5 “

The illuminant is petroleum vapour burned under a mantle, and the apparatus was furnished by Chance Bros. & Co., Birmingham, England.

Heath Point, Anticosti.—As soon as possible after the opening of navigation in 1907 the department will complete the raising of the present tower at Heath Point and install a first order single quick-flashing light.

SESSIONAL PAPER No. 21

The apparatus, now at Quebec, is of 920 mm. focal distance, consists of two panels, each lens subtending a horizontal angle of 157 degrees and a vertical angle of 126 degrees. The lantern is 14 feet 1½ inches in diameter and the illuminant, petroleum vapour burned under a mantle.

The apparatus was constructed by Barbier, Benard & Turenne, Paris.

Cape Magdalen, P.Q.—A reinforced concrete tower is almost completed at this station to receive a third order triple flashing-light and lantern now at Quebec. This light should be in operation soon after the opening of navigation in 1907.

The apparatus will show a group of three flashes in every 30 seconds, and make a complete revolution in 30 seconds. In each period of 30 seconds the light will have the following characteristic:—

First flash..	0·525 seconds.
Short eclipse..	5·475 “
Second flash..	0·525 “
Short eclipse..	5·475 “
Third flash..	0·525 “
Long eclipse..	17·475 “
	30·000 “

The optical portion is of 500 mm. focal distance composed of a group of three panels, each panel subtending 72 degrees in the horizontal plane and 136 degrees in the vertical plane. A catadioptric mirror of 600 mm. focal distance subtends 144 degrees at the focus.

The illuminant will be petroleum vapour burned under a mantle. The apparatus was manufactured by Barbier, Bernard & Turenne, Paris.

Matane, P.Q.—A reinforced concrete tower is under construction at this station to receive a third order double flashing light now at Quebec awaiting erection.

It is expected that this tower will be completed and the light in operation early in the summer of 1907.

The apparatus will show a group of two flashes every 7½ seconds, and make a complete revolution in 30 seconds.

In each period of 7½ seconds the light will have the following characteristics:—

First flash..	0·525 seconds.
Short eclipse..	0·975 “
Second flash..	0·525 “
Long eclipse..	5·475 “
	7·500 “

The apparatus has a focal distance of 500 mm. composed of four groups of two panels each. The panels subtending 45 degrees in the horizontal plane and 136 degrees in the vertical plane.

The illuminant will be petroleum vapour burned under a mantle. The apparatus was constructed by Barbier, Benard & Turenne, Paris, France.

Métis, P.Q.—A reinforced concrete tower is under construction at this station to receive a third order triple flashing light similar to the light described for Cape Magdalen above. It is expected that this light will be in operation early in 1907.

Cape Anguille, P.Q.—A light at fog-alarm is under construction at this point, and a third order double flashing light similar in all respects to the light provided for Matane, P.Q., will be installed and the light should be in operation early in the summer of 1907.

6-7 EDWARD VII., A. 1907

Crane Island, P.Q.—The light at this station has been strengthened by substituting for the seventh order occulting lens light a fourth order lens light, with occulting screen operated by spring clockwork. The illuminant was changed from oil to petroleum vapour.

The new apparatus gives 10 seconds light and 5 seconds eclipse, and was manufactured by Chance Bros. & Co., Birmingham, England.

Bellechasse, P.Q.—This light was improved by the substitution of a petroleum vapour light for the oil lamp previously used.

Ste. Petronille, P.Q.—The white occulting gas light, seventh order, formerly exhibited at this station, has been replaced by a fourth order lens occulting screen, operated by clockwork. The illuminant is petroleum vapour burned under a mantle. The light is visible for 5 seconds and eclipsed for 3 seconds, alternately.

The apparatus was manufactured by Chance Bros. & Co., Birmingham, England.

PROVINCE OF NOVA SCOTIA.

Cape Race, Nfld.—A reinforced concrete tower has been constructed at this station to carry a hyper-radial single flashing light and 17-foot lantern. The lantern has been delivered at the site, but owing to the lateness of the season the apparatus has been held at Halifax for erection in the spring of 1907.

The apparatus is single flashing of 1330 mm. focal distance consisting of four panels, each panel subtending a horizontal angle of 90 degrees and a vertical angle of $118\frac{1}{2}$ degrees. The apparatus will make a complete revolution in 20 seconds and give the following characteristic:—

Flash.	0.203 seconds.
Eclipse.	4.797 “

The illuminant is petroleum vapour burned under an 85 mm. mantle. The lantern is 17 feet $1\frac{1}{2}$ inches and the balustrade 24 feet in diameter.

Cape Race is one of the most important light stations maintained by Canada, and the hyper-radial light provided, when installed, will be the largest apparatus in any light station in North America. The candle power for a single flash is estimated at 1,000,000 candles.

The apparatus and lantern were constructed by Messrs. Chance Bros. & Co., Birmingham, England.

Sambro, N.S.—The tower at this station has been raised and a first order single flashing light erected, replacing a second order fixed light.

The apparatus is of 920 mm. focal distance, consisting of four panels of 90 degrees each in the horizontal plane and 126 degrees in the vertical plane. A complete revolution is made in 20 seconds, and in each period of 5 seconds the flash is 0.29 seconds.

The illuminant will be acetylene burned under a mantle.

The apparatus was constructed by Messrs. Barbier, Benard & Turenne, Paris, France.

Mauger's Beach, N.S.—The tower at this station has been raised ten feet and a third order dioptric quick flashing light and lantern installed, replacing a fifth order quick flashing light which was not found to be sufficiently powerful.

The apparatus is single flashing of 500 mm. focal distance, composed of 8 panels, each panel subtending 45 degrees in the horizontal plane and 136 degrees in the vertical plane.

In each period of 5.625 seconds the light has the following characteristic:—

Flash.	0.787 seconds.
Eclipse.	4.838 “

5.625 “

SESSIONAL PAPER No. 21

The illuminant is petroleum vapour burned under a mantle, and the standby light acetylene.

The apparatus was constructed by Barbier, Benard & Turenne, Paris, France.

Pictou Island, East End.—The fixed white catoptric light at this station has been replaced by a fourth order single quick flashing light. The apparatus is of 250 mm. focal distance, and consists of 6 panels, each panel subtending 60 degrees in the horizontal and 144½ degrees in the vertical plane. In each period of five seconds the light has the following characteristic:—

Flash.	0·957 seconds.
Eclipse.	4·043 “
	5·000

One complete revolution in 30 seconds.

The illuminant is petroleum vapour burned under a mantle. The apparatus was made by Barbier, Benard & Turenne, Paris, France.

PROVINCE OF PRINCE EDWARD ISLAND.

Cape Egmont.—A single flashing fourth order light was installed at this station, replacing a fixed red catoptric light. This is similar in all respects to the light installed at Pictou Island, N.S.

Seacow Head.—The fixed white catoptric light exhibited at this station has been replaced by a fourth order double flashing light.

The apparatus of 250 mm. focal distance consists of two groups of two panels each, each panel subtending 90 degrees in the horizontal plane and 144½ degrees in the vertical plane.

In each period of 10 seconds the light gives the following characteristic:—

First flash.	0·638 seconds.
Short eclipse.	1·862 “
Second flash.	0·638 “
Long eclipse.	6·862 “
	10· “

One complete revolution in 20 seconds.

The illuminant is petroleum vapour burned under a mantle.

The apparatus was constructed by Barbier, Benard & Turenne, Paris, France.

Cape Tryon.—The temporary apparatus seventh order lens showing a fixed white light exhibited at this station has been replaced by a fourth order single flashing light.

The apparatus is of 250 mm. focal distance, composed of four lenticular panels subtending each 90 degrees in the horizontal and 144½ degrees in the vertical plane.

In each period of 5 seconds the light will have the following characteristic:—

Flash.	0·638 seconds.
Eclipse.	4·362 “
	5· “

One complete revolution in 20 seconds.

The illuminant is petroleum vapour burned under a mantle.

The apparatus was constructed by Barbier, Benard & Turenne, Paris, France.

PROVINCE OF BRITISH COLUMBIA.

Trial Island.—An apparatus, fourth order, dioptric double flashing, similar in all respects to that supplied for Seacow Head, P.E.I., has been sent to British Columbia for the Trial Island station.

6-7 EDWARD VII., A. 1907

Discovery Island.—The sixth order fixed light formerly exhibited at this station has been replaced by a fourth order lens light showing over 360 degrees of the horizon with occulting screen operated by clock-work. The light is visible for ten seconds and eclipsed for 5 seconds.

The apparatus was constructed by Chance Bros. & Co., Birmingham, England.

PROVINCE OF ONTARIO.

Gull Island, Lake Ontario.—The fixed white catoptric light consisting of a ring of eleven reflectors and lamps has been replaced by a fourth order lens light similar in all respects to the light supplied by Chance Bros. & Co., Birmingham, England, for the light at Discovery Island, B.C.

The following lighthouse apparatus has been supplied by the Dominion lighthouse depot, Prescott, for new lights or for the improvement of existing lights:—

PROVINCE OF NOVA SCOTIA.

Name of Station.	Order of lens.	Arc of visibility.	Remarks.
Guysborough Harbour.....	5th	270

Denman Island.....	6th	270	

In each case where lenses were supplied the department also forwarded the necessary lamps, stores and usual accessories.

WIGHAM THIRTY-DAY OIL LIGHTS.

These lights are automatic oil lights which operate without attention for thirty days.

In the Wigham lights the wick burns horizontally passing slowly over a small roller, thus obtaining the light from the side and not from the end nor from the edge of the wick. The burner is surrounded by a combustion cone, and surrounded by lenticular apparatus; one end of the wick is conveyed up through an oil tight brass tube, receiving its supply of oil from the oil reservoir through holes in its sides, and the other end brought down through a tube standing above the level of the oil in the lamp, and soldered or secured at the lower end. A circular float is placed in a copper cylinder fixed to the bottom of the lamp, and filled with oil. When the lamp is first lighted this float is at the top of the cylinder, and is attached by means of hooks or loops to the wick. The oil in the cylinder is caused to drop slowly out of it through a valve of peculiar construction, supplied with a cotton core for filtering purposes, at such speed as may be necessary to cause the float to reach the bottom of the cylinder at the end of the period for which the lamp is intended to keep alight. The oil thus slowly descends within the cylinder, bringing with it the float and the wick which is attached to it. At the end of the month it is necessary to replenish the lamp with oil, and fit the new wick.

In certain of the narrow channels of British Columbia these lights possess advantages and they have been established at the following points in that province during the past year, viz.:—

- | | |
|----------------------|-----------------------------|
| 1. Amphitrite Point. | 6. Walker Rock. |
| 2. Crofton. | 7. South Sand Heads. |
| 3. Coffin Island. | 8. Fraser River, North Arm. |
| 4. Danger Reef. | 9. Sechelt. |
| 5. Nanaimo Harbour. | |

DOMINION LIGHTHOUSE DEPOT.

During the past year the water front of the department's property has been improved, but much delay has been experienced in obtaining timber and stone. Up to the present the main east and west cribs are in possession and partially filled while the cribwork on the eastern side of the property is completed with the exception of the outer block. Arrangements have been made for the rest of the timber required for the docks and for the hauling out ways and it is being delivered.

Lightship No. 1, Lake St. Louis, was thoroughly overhauled and replaced, lightship No. 2, in the lakes mentioned above, while the latter will receive repairs this winter, replacing in the spring No. 3 lightship which required attention.

A cast-iron cylindrical segmental tower was fitted at Prescott for Cape Norman, Newfoundland, and shipped to Quebec with apparatus and lantern ready for erection.

A similar tower is now being prepared for Cape Bauld, Newfoundland.

A continued gas and derrick scow is under construction for the Parry Sound agency. The scow is 100 x 30 x 6 feet and will carry a structural steel derrick capable of lifting twenty tons. The scow will be towed to Parry Sound and will carry on deck two No. 11 gas and whistling buoys for the Georgian Bay.

A list is given above of the lighthouse apparatus supplied to the various agencies by the lighthouse depot.

Prescott is also headquarters for the Montreal-Kingston buoy and lighthouse service.

Tests have been carried out with various petroleum vapour lights of different sizes and makes, and a report has been prepared by Mr. Allan Brebner, M. Inst. C.E., which will be available later.

The depot is in charge of Mr. W. H. Noble, Assistant Commissioner of Lights, and Mr. A. Boyle is accountant.

MONTREAL-KINGSTON DIVISION.

This division extends from Lachine, P.Q., to Ste. Anne de Bellevue, on the Ottawa river, and from Lachine to Nine-mile Point, and centre Brother light, Lake Ontario.

During the past season of navigation there were maintained 37 gas buoys, iron can buoys, spar buoys and lighthouses using compressed acetylene and lights burning oil.

At the close of navigation there were 20 shallow draft spar gas buoys, 1 deep draft spar gas buoy, 13 'Scout' type gas buoys and 3 number 7 automatic gas buoys in service.

The 'Scout' type buoys will be withdrawn as soon as possible.

The lighthouse at Burnt Island requiring extensive repairs was replaced by a steel storeholder bedded in concrete at base, surmounted by a structural steel lantern support and standard 200 mm. gas lantern. This makes a permanent structure, and eliminates the question of repairs.

There are now 4 gas lights of the type referred to in this division, viz.: St. Regis dyke (2), North Channel dyke and Burnt island.

In the past season of navigation the *Scout*, *Reserve*, derrick scow *Prescott* and gas compressing were in commission.

The service has been carried out to the satisfaction of the shipping interests, and no complaints were received.

PARRY SOUND AGENCY.

On April 23, 1906, an unfortunate accident occurred near Ten-mile Point during the charging of a Scout type gas buoy, which resulted in the death of Captain Arthur Clarke, and caused considerable damage to the contractor's tug and the department's apparatus.

A careful investigation was held, and it was found impossible to determine the ultimate pressure which the buoy in question was raised to. Instructions had been given that no higher pressure than 5 atmospheres was to be used in service. The Spruce Island gas buoy, which had previously been placed by Captain Clarke, had a pressure of 6 atmospheres, which caused an extra overload on the buoy of about 100 tons.

It is greatly to be regretted that no data was available to show the pressure to which the exploded buoy was raised. After the accident, all the high pressure buoys in the Parry Sound agency were replaced by such automatic low pressure buoys as were available. In some cases, No. 5 buoys were used, and these will be replaced by No. 8½ buoys.

NOVA SCOTIA AND NEW BRUNSWICK GAS BUOY SERVICES.

The Courtnay buoys along the coast of Nova Scotia and Bay of Fundy are being replaced as rapidly as the department's steamers can carry out the work, by No. 11 lighted whistling buoys. The repairs to the *Lady Laurier* which has kept her out of commission for some time, has delayed the placing of the buoys referred to.

St. John Harbour.—Gas buoys have been placed in the harbour replacing unlighted buoys. Five gas buoys No. 5 type have been placed in the Restigouche river, and two gas buoys No. 5 type have been placed in the Miramichi river.

(INCLOSURE B.)

LIST OF BEACONS AND BUOYS—BRITISH COLUMBIA.

North bank buoy, platform, cage and drum, Clayoquot sound.	Patterson rock buoy, platform and cage, Esquimalt.
Vargas rock buoy, platform, cage and ball, Clayoquot sound.	Dyke point beacon, wooden cone, Esquimalt.
Meares spit buoy, platform and cage, Clayoquot sound.	Canteen buoy, platform and cage, Esquimalt.
Browning passage buoy, spar, Clayoquot sound.	Channel rock buoy, platform, cage and drum, Victoria.
Browning passage buoy, spar, Clayoquot sound.	Middle beacon, three piles and light, Victoria.
Browning passage buoy, spar, Clayoquot sound.	Songhies point buoy, spar, Victoria.
Hankin rock buoy, platform and cage, Clayoquot sound.	Hospital rock buoy, platform and cage, Victoria.
Templar rock buoy, steel can and drum, Clayoquot sound.	Shoal point beacon, three piles and light, Victoria.
Whistling buoy, steel frame and whistle, Amphithrite point.	Brotchie ledge beacon, steel and concrete, light and fog signal, Strait of Juan de Fuca.
Sutton rock buoy, platform and cage, Barkley sound.	Lewis rock, masonry and drum, Baynes passage.
Swale rock beacon, framework and light, Barkley sound.	Johnstone reef buoy, steel can, Haro strait.
Somas river beacon, three piles, Barkley sound.	Zero rock beacon, masonry and cone, Haro strait.
Somas river beacon, three piles, Barkley sound.	Kelp reef beacon, masonry and ball, Haro strait.
Somas river beacon, three piles, Barkley sound.	Escape reef beacon, wooden cone and drum, Stuart channel.
Whistling buoy, steel frame and whistle, Port San Juan.	False reef buoy, steel can, Stuart channel.
Rosedale rock buoy, steel can, Race rocks.	Coffin island beacon, framework and light, Stuart channel.
Whale rock buoy, spar, Esquimalt.	South beacon (Holland bank), three piles and drum, Oyster harbour.
	North beacon (Dunsmuir islands), three piles and drum, Oyster harbour.

LIST OF BEACONS AND BUOYS—BRITISH COLUMBIA—*Continued.*

- White rock buoy, steel can, Trincomali channel.
- Danger reef beacon, framework and light, Trincomali channel.
- False narrows buoy, spar, False narrows.
- False narrows buoy, spar, False narrows.
- Middle reef buoy (east), spar, False narrows.
- Middle reef buoy (west), spar, False narrows.
- Shark cove buoy (canal), spar, northern shore, south Pender island.
- Shark cove buoy (canal), spar, southern shore, north Pender island.
- Shark cove buoy (canal), spar, southern shore, north Pender island.
- Rosenfeld reef buoy, steel can and cage, strait of Georgia.
- Gossip reef buoy, steel can, Active pass.
- Sandheads buoy, steel frame and bell, Roberts bank, strait of Georgia.
- Fraser river entrance buoys, steel conical, black, seven in number.
- Fraser river entrance buoys, steel conical, red, seven in number.
- Fraser river buoy, spar, red, Woodward slough.
- Fraser river buoy, spar, black, Woodward slough.
- Fraser river north arm buoys, spar, position and number to suit navigation.
- Fraser river north arm beacons, single piles, position and number to suit navigation.
- Point Grey fairway buoy, steel framework, Burrard inlet.
- Spanish bank beacon, five piles and drum Burrard inlet.
- West beacon, First narrows, five piles and square, Burrard inlet.
- East beacon, First narrows, five piles and triangle, Burrard inlet.
- First narrows buoy, spar, Burrard inlet.
- Parthia shoal beacon (west), mast with drum, Burrard inlet.
- Parthia shoal beacon (east), mast with drum, Burrard inlet.
- Burnaby shoal buoy, spar, Burrard inlet.
- Gibson's landing beacon, masonry and ball, shoal channel, Howe sound.
- Rock point reef buoy, spar, strait of Georgia.
- Welcome point reef buoy, spar, strait of Georgia.
- Darcy rock buoy, steel can, Sidney channel.
- Sidney spit buoy (east), steel can, Sidney channel.
- Sidney spit buoy (west), steel conical, Sidney channel.
- Sidney spit beacon, wooden cone and ball, Sidney spit.
- Sidney wharf buoy (south), spar, shoal off wharf.
- Sidney wharf buoy (north), spar, shoal off wharf.
- Sidney rock buoy, platform and cage, rock off wharf.
- Dock island beacon, framework and light, Dock island.
- Canoe rock beacon, masonry and drum, Canoe rock.
- Colbourne buoy (south), platform and drum, Colbourne passage.
- Colbourne buoy (north), platform and ball, Colbourne passage.
- Celia reef buoy, steel conical, Shute passage
- Shute rock beacon, masonry and ball, Satellite channel.
- Kelp rock buoy, steel conical, Satellite channel.
- Batt rock buoy, steel can, Ganges harbour.
- Horda rock buoy, platform and ball, Ganges harbour.
- Enterprise beacon, masonry and ball, Trincomali channel.
- Benmohr rock buoy, platform and ball, Trincomali channel.
- Atkins beacon, masonry and ball, Trincomali channel.
- Governor rock buoy, platform and ball, Trincomali channel.
- Walker beacon, masonry, framework and light, Trincomali channel.
- Victoria rock buoy, steel can, Trincomali channel.
- Romulus rock beacons, two posts and slats, Galiano island, Portier pass, south of rock.
- Romulus rock beacons, two posts and slats, Galiano island, Portier pass, east of rock.
- Portier pass, fairway buoy, steel can and drum, Portier pass.
- Grappler rock buoy, steel can, Houston passage.
- Crofton beacon, framework and light, Osborn bay.
- Indian reef buoy, steel can, Stuart channel.
- North reef beacon wooden cone and ball, Stuart channel.
- Tattenham ledge buoy, spar, Malaspina strait.
- Atrevida reef buoy, spar, Malaspina strait.
- North point, Texada buoy, spar, Malaspina strait.
- Gabriola reef beacon, masonry and ball, strait of Georgia.
- Snake island buoy, steel conical, strait of Georgia.
- Horsewell reef buoy, steel can, strait of Georgia.
- Clarke rock buoy, platform and pyramid, strait of Georgia.
- Dorcas rock buoy, spar, strait of Georgia.
- Kelp reef buoy, steel frame and bell, strait of Georgia.
- Cortes island buoy, steel can, strait of Georgia.
- Whaleton rock buoy, spar, Whaleton bay.
- Shark spit beacon, five piles and drum, Mary island spit.
- Channel rock spindle, iron spindle and drum, Mary island spit.
- Camp point beacon, pyramid and cone, Johnstone strait.
- Ledge point buoy, spar, Broughton strait.
- Walbran rock buoy, spar, Fisher channel.
- White point beacon, pyramid, Lama passage.
- Regatta rock beacon, pyramid and ball, Lama passage.
- Dall patch buoy, platform, pyramid and ball, Lama passage.
- White stone beacon, square and drum, Lama passage.
- Whistling buoy, steel frame and whistle, Vancouver rock, Milbank sound.
- Watson rock beacon, pyramid and drum, Grenville channel.
- Hazel point buoy, spar, Middle passage.
- Alford reef buoy, steel can, Metlakatla harbour.
- Tugwell reef buoy, spar, Metlakatla harbour.
- Shrub beacon, masonry and ball, Metlakatla harbour.

6-7 EDWARD VII., A. 1907

LIST OF BEACONS AND BUOYS—BRITISH COLUMBIA—*Continued.*

Harbour channel buoy (west), platform and drum, Metlakatla harbour.	Hankin reef buoy, platform and pyramid, Cunningham passage.
Harbour channel buoy (east), platform and drum, Metlakatla harbour.	Dodd passage buoy, spar, Port Simpson harbour.
Hodgson reef buoy, steel can, Chatham strait.	Harbour reef buoy, steel conical, Port Simpson harbour.
Sparrowhawk rock buoy, steel can, Cunningham passage.	

SOOKE HARBOUR.

Whiffen spit beacon, framework and light, Sooke harbour entrance.	Sooke beacons, single piles, three in number.
---	---

MUD BAY.

Blackie spit beacon, three piles, west extreme spit.	Junction beacon, three piles, Slue and Serpentine.
Blackie spit beacon, single pile, south side channel.	Slue beacons, single beacons, 18, on banks of Slue, where required.
Blackie spit beacon, single pile, south side channel.	Serpentine beacons, single beacons, 15, on banks of Serpentine, where required.
Main channel beacons, single piles, 3, east side of channel.	Nicomeck'l beacons, single beacons, 6, on banks of river, where required.

NANAIMO HARBOUR.

Harbour light beacon, framework and light, south side of entrance.	Satellite reef buoy, platform, pyramid and triangle and ball, south end of reef.
Entrance buoy, platform, pyramid and triangle, south side of south channel.	Mill stream buoy, platform, pyramid and triangle and triangle, east extreme of shoal.
Gallows point buoy, platform, pyramid and triangle, north side of entrance.	Carpenter rock buoy, platform, pyramid and triangle and ball, close eastward of rock.
South channel buoy, platform, pyramid and triangle and diamond, south side, south channel.	Middle bank buoy, spar, southwest shoulder of bank.
Middle bank buoy, platform, pyramid and triangle and ball, south end, middle bank.	Middle bank buoy, spar, west shoulder of bank.
South channel buoy, platform, pyramid and triangle and diamond, south side, south channel, west end.	Middle bank beacon, five piles and light, north end of bank.
	Beacon rock, masonry and ball, on summit of rock.

PROTECTION ISLAND PASSAGE.

Passage rock buoy, platform, pyramid and triangle, close east of rock.

DEPARTURE BAY.

Departure bay buoy, platform, pyramid and ball, west extreme of shoal.

KOOTENAY LAKE.

Kootenay river mouth, buoy, platform, pyramid and cross, northwest end spit, entrance west channel, south arm.	Thirteen mile point, buoy, platform, pyramid and cross, north end, spit.
Kootenay river mouth buoy, platform pyramid and cross, south end island, same entrance.	Yuills shoal, upper end buoy, platform, pyramid and cross, off Kokani creek.
Balfour buoy, spar, outer end spit, west arm, north side.	Yuills shoal, lower end buoy, platform, pyramid and cross, off Kokani creek.
Proctor buoy, platform, pyramid and cross, outer end spit, west arm, south side.	Nine mile point buoy, platform, pyramid and cross, north end of spit.
Proctor middle ground buoy, spar, on the shoal, between Proctor and Balfour.	Seven mile point buoy, platform, pyramid and cross, north end of spit.
Middle ground buoy, platform, pyramid and cross, east of Narrows.	Six mile point buoy, platform, pyramid and cross, north end of spit.
Narrows buoy, platform, pyramid and cross, near Saw-mill point.	Five mile point buoy, platform, pyramid and cross, north end of spit.
Middle ground buoy, platform, pyramid and cross, between old mill and narrows.	Shipyard shoal buoy, platform, pyramid and cross, opposite shipyard, near Nelson.

SUBMARINE SIGNALS.

The department has established at Chebucto Head, approach to Halifax harbour, an electric submarine signal station. The submarine bells, two in number, with independent cables, are located 2 cables N. 1 degree E. from the inner automatic gas and whistling buoy in latitude N. 44 degrees 31' 51" and W. 63 degrees 30' 0", and during thick and heavy weather a signal consisting of four strokes at intervals of $4\frac{1}{2}$ seconds followed by a silent interval of $6\frac{1}{2}$ seconds.

In order to mark the position of the bell tripods, two, one red, wooden spar buoys have been attached thereto.

Work in connection with the establishment of similar submarine signal stations is under way at the following points, viz.: Louisburg, N.S., Yarmouth, N.S., and Negro Head, N.B. The buildings required for the stations will be erected by the chief engineer's branch.

Submarine bell buoys.—The department has in service special submarine bell buoys made by the Submarine Signal Company of Boston, and also submarine bell attachments on the automatic gas buoys, and any extension of this system required in future will be along this line. Where an automatic gas buoy is in position it is considered better to add a submarine bell attachment rather than to moor alongside a special submarine bell buoy. All automatic gas and whistling buoys have been provided, free of charge, to the department, with receptacles to carry the submarine bell attachment.

Delay has been experienced in obtaining from the Submarine Signal Company the required attachments, but by the opening of navigation, 1907, a number should be in operation.

The following submarine bells were in operation during the past season, viz.:—

1. Lurcher lightship.
2. Anticosti lightship.
3. Red Island lightship.
4. Prince Shoal lightship.
5. White Island lightship.
6. Egg Island bell buoy.
7. Sambro bell buoy.
8. Halifax Harbour (station at Chebucto Head).

The Shipping Federation of Canada has requested that the following additional bells be established, viz.:—

- Bird Rocks.
- St. Pauls.
- Belle Isle.
- Green Island.
- South Point, Anticosti.
- Pointe aux Basque.
- Cape Race.
- Platt Point, Little Miquilon.
- Point Anguille, near St. George's Bay, Newfoundland.
- Fame Point, Gaspé peninsula.
- Cap Rosier, Gaspé peninsula.
- Matane, Gaspé peninsula.
- Point Snel, Gaspé peninsula.
- Flat Point, near Sydney harbour.
- Scatari, C.B.
- Whitehead, N.S.

Beaver Island, N.S.
 Little Hope, near Liverpool bay.
 Brazil Rocks, S.W. Nova Scotia and Bay of Fundy.
 Blonde Rocks.
 Gannet Rock.
 Beatson's Rock.
 Partridge Island, St. John, N.B.

The Submarine Signal Company has advised the department that up to December 1, 1906, the following vessels have been equipped with submarine signal apparatus:—

North German Lloyd Line—	Merchant & Miners Trans. Line—
Kaiser Wilhelm II.	Nantucket.
Kaiser Wilhelm der Grosse.	Gloucester.

APPENDIX No. 3.

SOREL SHIPYARD.

SOREL, October 22, 1906.

Lt. Col. F. GOURDEAU,
Deputy Minister of Marine and Fisheries,
Ottawa.

Sir,—I have the honour to report on the work done at the Sorel shipyard during fiscal year ending June 30, 1906.

DREDGE 'W. S. FIELDING.'

This is a steel twin screw hopper dredge constructed for the Department of Public Works. The hull of the dredge is 254 feet long by 52 feet beam, by 18 feet depth. She is equipped with a chain of elevator buckets and a suction pipe and is designed to dredge in 50 feet of water. This dredge was about finished in the year 1904-5. In the present year she was completely finished and tested in July and August. In the beginning of September she left Sorel to work on the sea coast. A number of spare parts were made for this dredge.

TUG 'PORTNEUF.'

This is a wooden vessel 85 feet long over all, 17 feet 3 inches beam, with a depth of 9 feet 9 inches. This vessel was begun in February, 1905, and was finished in August of the same year. She is for use with the dredging fleet of the St. Lawrence ship channel.

The main engine was compounded from the single cylinder engine of the dismantled tug *St. Francis*. A new marine boiler 8 feet 6 inches diameter by 8 feet 6 inches long, was built at the Sorel shipyard for this vessel. The vessel has accommodation for both day and night crew.

DUMP SCOWS.

Three of the dump scows, Nos. 1, 2 and 3, belonging to the St. Lawrence ship channel dredging fleet were partly rebuilt during the year.

TUG 'JESSIE HUME.'

This tug which belongs to the dredging fleet of the St. Lawrence ship channel, was partly rebuilt during the winter. Her hull was rebuilt from the water line up and her cabin work was entirely rebuilt and increased, giving accommodation for both day and night crews.

STEAMER 'LA CANADIENNE.'

This steamer which was transferred from the fishery service to the hydrographic survey, was partly rebuilt for the use of the latter service. The upper deck was extended forward; a new chart room, wheel house and cabins were built on this upper deck, new cabins were built on the main deck.

The officers' quarters aft were remodelled and refitted; an electric light plant was installed and the vessel was altered so as to fit her out as a survey boat.

SESSIONAL PAPER No. 21

SEA GOING HOPPER SUCTION DREDGE.

This is a steel dredge for use in the St. Lawrence ship channel. The hull is 264 feet long by 45 feet beam by 20 feet deep. This dredge is to be fitted with a centrifugal dredging pump working in a central well to a depth of 65 feet below load water line. The dredge will be equipped with twin screws driven by triple expansion engines. The pump will also be driven by an engine of the same type. There will be two cylindrical marine boilers 13 feet 6 inches diameter by 11 feet long.

Plans of this dredge were prepared in the Sorel shipyard in the spring and summer of 1905. The contract for the steel plates and shapes for the building of this dredge was given in October, 1905, and construction was begun in January, 1906. The framing was nearly all erected by the end of June, 1906.

STEAMER 'ROUVILLE.'

This is a wooden steamer for the use of the Mounted Police Department in Hudson Bay. The hull is 130 feet over all by 26 feet beam by 16 feet deep, with a draft of water of 12 feet 6 inches. The hull of the vessel is built of oak, rock elm and southern pine, and is extremely heavy so as to resist the ice pressure which may be encountered in Hudson bay. The boat is equipped with a compound engine with cylinders 18 by 36 inches diameter, by 24-inch stroke, driving a propellor wheel 8 feet 6 inches in diameter, provided with removable blades.

The boiler is of Scotch marine type, 12 feet 6 inches in diameter by 10 feet long, with a working pressure of 140 pounds.

This vessel was begun in November 1905. She was launched on June 9 and was nearly finished by the end of the fiscal year. She was ready for service in the beginning of August, 1906.

STEAMER 'VERCHERES.'

This is a small wooden steamer for the use of the lighthouse inspection staff. The hull is 100 feet in length by 16 feet beam by 9 feet depth of hull, with a draft of 7 feet 6 inches and a displacement of 126 tons. Work on this boat was begun in January. The construction of the hull was well advanced by the end of the fiscal year.

STEEL TOWERS.

Steel towers for lighthouses were built for Bécancour, Ste. Anne, Champlain, Ile du Moine and Ile de Grâces, between Montreal and Quebec, and one steel tower was built for use at Souris, P.E.I. Repairs and alterations were also made to some other steel lighthouse towers. Different vessels attached to the inspection and construction of lighthouses were repaired during the year and coal and supplies were furnished to these vessels.

REPAIR WORK FOR ST. LAWRENCE SHIP CHANNEL.

A large part of the work done at the Sorel shipyard consists of the maintenance of the vessels of the St. Lawrence ship channel dredging fleet. The hulls and machinery of these vessels were maintained in good condition during the fiscal year 1904-5. During the winter the machinery was completely overhauled and repaired. The hulls and cabin work were painted and the equipment was repaired and put in proper condition.

Clutches and frictions were added to the bow winches on four dredges to enable them to run up their wires faster. On four of the hoisting winches larger cylinders were installed and bronze worm wheels with cut steel worm gearing were attached so as to give greater power.

The steamer *Frontenac* had new cylinders on her main engines.

5-6 EDWARD VII., A. 1906

Dredge No. 1 had a new furnace in one of her boilers and this boiler was thoroughly overhauled and given heavy repairs.

Dredge No. 4 was docked in Tait's dry dock, Montreal, for repairs to the hull: these repairs being effected by the shipyard staff.

Dredge No. 7 had very heavy repairs to her boilers. Her pontoons were hauled up during winter, scraped and painted.

REPAIR WORK FOR DEPARTMENT OF PUBLIC WORKS.

Several of the vessels belonging to the dredging fleet of the Public Works Department were repaired at the shipyard during the year 1904-5.

The dredge *St Louis* and her dump scows and the tugs *Ottawa* and *Daisy* were hauled out and repaired during the year.

A new bucket was fitted for the dredge *International*. A new arm was built for the dredge *Progress* and various minor repairs were made.

Coal and other materials were also furnished to these vessels during the year.

HAULING OUT.

The slip ways of the shipyard were kept busy during the year hauling out various vessels of the dredging fleet and of other departments for repairs. Thirty-six vessels were hauled out during the season. The following vessels were hauled out for the winter and launched again in the spring: Dredge *St. Louis* and two scows, steamer *Alpha*, steamer *Maisoneuve*, tug *Daisy*, dump scows Nos. 1, 2 and 3.

HYDROGRAPHIC SURVEY.

The steamer *De Levis*, attached to the Hydrographic Survey of the river St. Lawrence, was kept in repair during the year.

The steamer *La Canadienne* was given supplies and materials.

STEAMER 'ARCTIC.'

The steamer *Arctic* wintered at Sorel after her cruise in Hudson bay. The machinery of the vessel was overhauled and repaired, and some alterations were made in the engines and boilers. The hull of the vessel was scraped, caulked and painted. New sails were provided. A storage battery and air compressor were installed and the vessel was generally repaired and put in good condition. Materials and supplies were also furnished for next cruise.

IMPROVEMENTS TO SHIPYARD.

A building with steel frame and brick walls, 52 feet by 32 feet, was built for use as a substation. The high voltage current received from the Sorel Electric Company is here converted into low potential, alternating and direct current, suitable for light and lighting purposes in the shipyard. A 300 horse-power motor generator was installed in this substation. A Rand compound air compressor was also installed. This machine has a capacity of 700 cubic feet of air per minute and is driven by a direct current electric motor of 125 horse-power. This substation was ready for operation at the end of December. Since this time the steam engines of the shipyard have been idle and all machinery has been run by electric power. For this purpose a number of dynamos were installed and a system of electric wires was run through the shipyard.

WHARF NO. 4.

This is a new wharf which was begun in the previous year. The wharf is 150 feet in length and replaces an old railway wharf which had become dangerous and had to be demolished.

SESSIONAL PAPER No. 21

SAW MILL.

A building 60 feet by 70 feet, two stories high, with two one-story wings, each 28 by 55 feet, was erected for use as a saw mill and for the accommodation of the woodworking machinery of the shipyard. This building is steel frame, with wooden walls and floors of slow burning construction. The foundations are of rough masonry. The electric motors and heavy line shafting driving the machinery are in the basement. This building was about completed by the end of the fiscal year and the machinery was being installed.

WATERWORKS.

Two electric driven turbine pumps were bought to replace the steam pump which supplied water to the shipyard. Some additional mains were laid.

GENERAL

All the buildings of the shipyard were painted during the year and all machinery was maintained in a good state of efficiency. An hydraulic machine for cutting steel channels and beams and doing light flanging was installed in the boiler shop. An extension was built to the blacksmith shop and three new forges erected. The railway of the shipyard was extended to allow of better distribution of material. The working force at the shipyard during the year varied from 400 to 750 men, and averaged 560. The financial statement, which I append, shows that the total amount expended at the Sorel shipyard during the year 1905-6 is \$888,960.04.

Yours truly,

G. J. DESBARATS,
Director of Shipyard.

SESSIONAL PAPER No. 21

APPENDIX No. 4.

METEROLOGICAL REPORT.

METEOROLOGICAL OFFICE.

TORONTO, September, 1906.

Lieut.-Col. F. GOURDEAU,
Deputy Minister of Marine and Fisheries,
Ottawa.

SIR,—I have the honour to submit the thirty-fifth annual report of the Meteorological Service of Canada, this report being for the fiscal year, July 1, 1905, to June 30, 1906, with Appendices A and B, reports of St. John and Quebec observatories.

The number of persons in receipt of pay from the Meteorological Service on June 30 for various duties performed in connection therewith was 210. Of this number 22 were employed in the central office and with a few at outside stations, devote their whole time to work of the service; others are occupied in observing during only a portion of each day, and others again are employed only to attend to the display of storm signals were notified.

There are now in the Dominion, Newfoundland and Bermuda 395 stations, using instruments which have been supplied by the government. At 38 stations, distributed at nearly equal intervals throughout Canada, three or more observations are taken daily and each morning and evening reports are telegraphed to Toronto. At 49 other points, observers receive remuneration for a more or less extended series of observations. Special observations for the Western Bulletin Service are taken at 23 places where small gratuities are paid; 71 persons are paid for attending to the display of storm signals alone, and for the time service and special telegraph service 6 persons are employed.

Since the issue of my last report the following stations have been opened :—

BRITISH COLUMBIA.

- Class II.—Athalmer, R. S. Gallop.
- “ II.—Fairview, J. R. Brown.
- “ II.—Salmon Arm, R. Hobson.
- “ III.—Hartley Bay, E. C. Winterbourne.

YUKON TERRITORY.

- Class III.—Dawson, J. B. Tyrrell.
- “ III.—Victoria Gulch, P. Holloway.

ALBERTA.

- Class III.—Conjuring Creek, J. A. Sangster.
- “ III.—Grassy Lake, D. K. Slawson.
- “ III.—Heather Brae, A. W. Fleming.
- “ III.—Josephsburg, James Robinson.
- “ III.—Nanton, A. D. Meacham.
- “ III.—Okotoks, Jos. D. Pugh.
- “ III.—Rocky Coulee, Albert Luchie.
- “ III.—Stavely, A. Brand.
- “ III.—Sion, F. W. Nash.

Saddle Lake, J. W. Carroll.

Class III.—St. Paul des Metis, Elzear Poitras.

Wabamun, J. C. Haddock.

SASKATCHEWAN.

- Class II.—Fond du lac, Anton Biehler.
 “ II.—Lemberg, G. A. Bock.
 “ II.—Willow Bunch, M. A. Noel.

MANITOBA.

- Class II.—Carberry, Henry Griffith.

ONTARIO.

- Class III.—Kioskoque Lake, Thos. H. Ledwood.
 “ III.—Strathroy, B. Gott.

Midway, B.C., Deseronto, Ont., and Ste. Agathe des Monts, Que., have from various causes ceased to report.

Sunshine recording instruments have been supplied to Haileybury, Kamloops, Medicine Hat, Calgary, Edmonton, Sherbrooke, Charlottetown, Dunvegan, and from some of these very good reports have been obtained.

CENTRAL OFFICE.

Increased accommodation in the central office is required as the staff is much cramped and it is difficult to find shelving room for climatic and meteorological records, and desk room for the staff.

The observatory has, through the expansion of the university, been deprived of all the land originally appertaining to it and there is now no suitable exposure for meteorological instruments in the vicinity. A portion of the building has been demolished to make way for the foundation of the new physical laboratory and part of the staff have been obliged to occupy rooms in a cottage acquired for use temporarily, or as the chairman of the university board of trustees has stated in writing, for one year from the spring of 1906. It would scarcely be possible that the situation could be in a more unsatisfactory condition for the carrying on of the meteorological work, and such is the case at a time when with the western provinces rapidly filling up and trade flourishing, seekers after climatological statistics and inquirers regarding weather conditions are rapidly on the increase. From the maritime provinces there has been an unprecedented demand for storm signals, and in the prairie provinces agriculturists are demanding a more extensive and more widely disseminated weather bulletin.

In September, 1903, with the authority of the department I fenced in the lot of land at the corner of Bloor and Devonshire place and placed therein a set of thermometers, a rain gauge and evaporating tank, thus to a great extent preserving the continuity of the records of these instruments.

In April last, acting under departmental instructions, I looked about Toronto, endeavouring to find some suitable quarters which might be temporarily occupied by the meteorological staff, until such time as a new building could be erected. It was found, however, that no suitable building was available and that it would be far better to remain in the old building. This being chiefly owing to the fact that in the old building is installed the transit instrument used for obtaining the time for Toronto and a portion of Ontario and for checking the time service of Quebec and the maritime provinces; also the seismograph for registering earthquakes occurring in far off countries; and the results obtained here are a most important contribution to science, as seismological investigation is expected to show much as to the physical constitution of the globe; also a barometer and thermometers recording photographically.

No temporary installation for these instruments could be as satisfactory as the present buildings with all its disadvantages.

SESSIONAL PAPER No. 21

It is altogether advisable that a new meteorological office be erected with as little delay as possible in order that the work of the service may be carried on under favourable conditions.

During the past year there has been no change in the personnel of the central office staff which numbers twenty-two ; twenty of whom are permanent employees and two temporary clerks. In addition, however, it has occasionally been found necessary to obtain further temporary assistance to make abstracts of records required by the bureaus of other countries and by scientific investigators both at home and abroad.

I would again respectfully urge that larger salaries be paid to officers and clerks in the meteorological service. The pay now allowed is in my opinion in most instances not at all commensurate with the importance of the work performed, and is on a decidedly lower scale than that given in the United States weather bureau and also lower than in other branches of the Canadian civil service. There have been no salary increases in the central office since July 1, 1904, notwithstanding the fact that the work of the office has augmented and that the cost of living has been steadily increasing.

During the year, the Climatological Report of Canada, a volume of 384 pages, has been printed, and 890 copies distributed in the various countries of both the old and the new worlds and to meteorological observers throughout Canada. The report contains the more or less complete climatic records of 319 stations and the compilation has entailed an immense amount of work, as most of the observers simply fill in the figures daily, without adding up the monthly columns, and most of the computations are done in the Toronto office. In addition to this annual volume, a report on the rain and snowfall of Canada up to the end of 1902 has been published. This volume will be of great value, not only to meteorologists but also to engineers requiring information as to water supply for industrial installations. All rainfall and snowfall records obtainable from the earliest days have been included in the work.

The Monthly Weather Review and the Monthly Weather Map, each of them publications entailing much work, have been issued with regularity, and the Special Meteorological Register of the Toronto observatory for the year 1905 has also been printed and distributed.

The number of publications received in the library during the fiscal year was 330, being for the most part annual, quarterly and monthly reports, from the meteorological, astronomical and magnetical observatories of the world.

The daily weather map has been duplicated by means of the mimeograph and distributed to schools and public buildings, as well as to foreign weather services ; a copy is also furnished to the chief of the Tidal Survey to be used in connection with his work. I had hoped to be able to have this map lithographed, as I am sure that it is now far from being a credit to the service, not being as neat and plain as that issued by many other weather bureaus. This improvement cannot, however, be carried out with the present appropriation.

Weather forecasts covering 36 hours in advance and sometimes a longer interval have been issued twice daily throughout the year. The weather charts on which the forecasts are based have entered on them information obtained by telegraph from 35 stations in Canada and 64 stations in the United States, also reports from St. Johns, Newfoundland, and Bermuda. The forenoon chart is ready for inspection ordinarily about 9.45 a.m. and the forecast official having drawn the isobars, first issues a bulletin for the Maritime provinces, including forecasts for the current and following day for Nova Scotia, New Brunswick and Prince Edward Island, and for vessels leaving for the Grand Banks and for American ports. Then follows a forecast for the western provinces, which is telegraphed without delay to Winnipeg, where a local agent, who has meanwhile received weather telegrams from some 23 points additional to those received in Toronto, prepares a bulletin giving a general synopsis of existing weather conditions and also includes all weather reports received, together with the forecasts from Toronto. This bulletin is then distributed in Winnipeg and telegraphed to the more important centres in the prairie provinces. The Central Office forecast official lastly prepares a bulletin

6-7 EDWARD VII., A. 1907

for Ontario and Quebec, which is usually despatched about 10.10 and is published very widely by the afternoon press as well as being posted at telegraph offices, post offices and other frequented places. At all the larger towns in these provinces a special effort has been made to have these bulletins exposed on wharfs and docks within easy reach of shipping people and fishermen.

The evening weather chart, like that of the morning, is usually ready for inspection about 9.45; and with as little delay as possible a bulletin is prepared for the press and forecasts are issued for all parts of the Dominion exclusive of British Columbia. These forecasts are distributed by the telegraph companies to most of the telegraph offices in the Dominion, and by arrangement are posted up in a frame hung in a conspicuous place; nearly every morning journal publishes them generally on the front page.

During the winter months a very large number of special forecasts were made for shippers of perishable goods, inquiries being made by both telephone and telegraph. Indeed it is doubtful whether nearly all shippers of such goods in the Dominion do not now consult the weather service before sending forward consignments.

During the winter, special warnings of snow and drift were issued to all Canadian railways whenever it was deemed necessary, and various electric railways have made a practice of consulting the central office as to the weather of the coming night, the information supplied enabling them either to reduce the working staff on duty to a minimum, or on the other hand to take the usual measure to prevent snow blockade.

During the late autumn many telegrams were received from vessel masters wishing to cross the lakes requesting special forecasts as to probable winds and weather, and indeed in some cases asking as to the advisability of starting.

The following table shows the percentage of verification of the ordinary 10 p.m. forecast, issued from Toronto, and also that of the forecasts for British Columbia issued from Victoria, B.C.:

STORM WARNINGS.

During the year, 1613 storm warnings were issued to the various districts in Canada where signals were displayed, and of this number 1,532 or 95.0 per cent were verified. On 463 occasions, however, the wind did not reach and on 106 occasions exceeded the force indicated by the signals displayed, also 98 warnings were received late owing to issue and 42 on account of delay in transmission.

In connection with the warnings the probable directions from which the gales would blow were also given, and of the 1,532 verified as to force, 1,190 or 77.7 per cent were fully and 1,431 or 93.4 per cent fully and partly verified. This is the best storm warning record in the history of the service.

At the close of navigation on the great lakes last autumn, I took occasion for the information of mariners, to call attention to the accuracy of the warnings issued by the Meteorological Service. The following is the letter referred to :—

METEOROLOGICAL OFFICE,

TORONTO, December 2, 1905.

The appalling loss of life and property on the Great Lakes during the months of October and November, together with the numerous articles which have appeared in the press relative to the stormy character of the past autumn, have rendered it important that a statement be offered to the public as to what warnings the Dominion Meteorological Service has given of these heavy and disastrous storms. The storms occurred on October 20, November 1, November 15, November 24, and November 28. In each instance the gale was forecasted in the weather bulletin issued from the central office, Toronto, on the forenoon of the previous day, and in every instance the gale signals were displayed well in advance of the storm. This is an important statement, and becomes doubly so when supplemented by the statement, that while every important storm of this past autumn has been predicted, there has been only one occasion on which the official bulletin forecasted a gale which did not occur, and on that day the forecast was, simply, that the wind would probably increase to a moderate gale on the following day on Lakes Erie and Ontario, and it failed to do so.

It is impossible to say how many lives and how many vessels have been saved by the storm warnings—as when a vessel remains in port on account of the warning, the captain very naturally is seldom prepared to allow that he would have been wrecked had he ventured out.

To mention simply the meteorological forecasts of the first and of the last of the heavy storms, namely those of October 20 and November 28: The 10 a.m. forecast of October 19 was : Easterly winds, increasing to gales ; rain to-night. Friday : North and north-west gales, showery and colder. Storm signals were displayed at all ports before 11 o'clock. Then, as regards that of November 28, the 10 a.m. forecast of the 27th read as follows : Fair and colder to-day and to-night ; Tuesday: Strong winds and gales north-east and east ; snow or rain. Storm signals were hoisted on Lake Superior ports at 10 a.m., and during the evening on the other lakes.

Many vessel masters do pay every attention to the weather forecasts and wire for special information before leaving port, but we maintain that, in view of the fact that the meteorological bulletins may be seen at almost every port in Ontario, no vessel whatever should leave harbour during the late autumn without having the latest forecasts.

During the past few weeks, several Toronto vessel captains have wired our central office for a two-day forecast before leaving Oswego or Rochester for Toronto or other Ontario ports, and there is good ground for belief that had all others done the same there might have been fewer casualties.

Yours faithfully,

R. F. STUPART,

Director Dominion Meteorological Service.

SEISMOGRAM SHOWING REGISTRATION OF EARTH WAVES AT TORONTO AND VICTORIA, B.C., CAUSED BY SAN FRANCISCO, CAL., EARTHQUAKE.

SESSIONAL PAPER No. 21

Many very severe storms swept over the maritime provinces during the winter months and it is gratifying to be able to state that storm signals never gave better, longer and more reliable warning than for these storms. Comments eulogizing the service appeared in the Halifax and St. John press on many occasions, e.g. : Halifax 'Chronical,' December 11, 1905. 'The storm that swept over the city yesterday was the severest of the season. The storm had been predicted by the meteorological office on Thursday when it was off the coast of Florida, but that it would not affect the maritime provinces before Sunday. On Saturday the Weather Bureau predicted heavy southeasterly gales with snow and rain, and this was verified almost to the letter. No steamers or other crafts—with the exception of the Dartmouth ferry steamer—were running.'

Halifax 'Herald,' December 11, 1905 :

'No disasters were reported last night. Ample warning was given by the Canadian Meteorological Bureau of what was coming. Thirty-six hours before the arrival of the storm it was reported moving up from the Florida coast. Then in Saturday evening's papers the warning of 'easterly gales with sleet or rain was repeated.' It came to the letter, demonstrating the great value of the Weather Bureau, which often before had been proved to be a good thing.'

St. John, N.B., 'Telegraph,' March 21, 1906 :

'The timely warning of the storm by the hoisting of the storm signal at the custom house, prevented any vessel from going to sea. Quite a number of coasting vessels are ready to go to their port of destination as soon as the storm abates.'

St. John, N.B., 'Globe,' March 20, 1906 :

'Another of the disturbances from the Gulf of Mexico and southwest states has moved to the maritime provinces. This type of disturbance has been by far the most numerous this season. The storm raging to-day was bulletined Monday morning and signals displayed later in the day. Our meteorological service is making a record that would be difficult to surpass; storm after storm has been accurately and timely forecasted and the warnings given by the bulletins and display of signals, greatly to the advantage and safety of shipping.'

Since my last report Port Daniel, Que., has been added to the list of storm signal stations which now number 81, distributed as follows : Three in British Columbia ; thirty-two on the Great Lakes, and forty-six in the maritime provinces. Arrangements are now being made to erect signal masts at Bonaventure River, Que., Corner of the Beach, Que., Point St. Peter, Que., and Gascons, Que.

OUTSIDE STATIONS.

Mr. E. Baynes Reed, assisted by Mr. F. N. Denison, continues in charge of the chief meteorological station in British Columbia and forecasts and storm warnings are issued by them for portions of the Pacific province and these have again shown a percentage of verification highly gratifying. For the compilation of weather charts in Victoria, all the Canadian telegraph reports from Port Arthur westward are transmitted to Victoria, and these together with some United States reports received from Portland, Oregon, form material for a fairly comprehensive weather map. Climatic reports from all stations in British Columbia are likewise compiled and recorded in the Victoria Meteorological Office and hence any information received by agriculturists and others regarding the climate of the province may be obtained in Victoria. Mr. Baynes Reed furnishes the press with most valuable and interesting weekly and monthly reviews which are published in some British as well as the provincial newspapers.

At Banff the self recording instruments on Sulphur mountain have continued in adjustment throughout the year, the records obtained affording data for an instructive comparison between the conditions prevailing on the mountain top and those in the valley 3,000 feet below. These satisfactory results are largely due to Mr. Sanson's zeal in frequently visiting the high station.

5-6 EDWARD VII., A. 1906

Atlin, B.C., and Sable island have been opened as telegraph reporting stations, the list of such stations now being as follows: Dawson, Atlin, Port Simpson, Victoria, New Westminster, Kamloops, Calgary, Edmonton, Medicine Hat, Swift Current, Battleford, Prince Albert, Qu'Appelle, Minnedosa, Winnipeg, Port Arthur, White River, Parry Sound, Southampton, Port Stanley, Kingston, Rockliffe, Ottawa, Montreal, Quebec, Father Point, Anticosti, Belle Isle, Chatham, Yarmouth, Halifax, St. John, Sydney, Charlottetown, St. Johns, Nfld., Sable Island and Bermuda.

It is the observers at these stations who supply the information on which the forecasts and storm warnings are based and inaccuracies in reports whether from ignorance or carelessness, cause much trouble to the forecast officials and are not unlikely to lead to erroneous predictions. The majority of the observers now at telegraph reporting stations are most efficient and reliable, but there are a few weak points which I would like to see strengthened.

Information has been conveyed to me by an inspector that there is some dissatisfaction in the western provinces that in order to obtain climatic statistics, immigrants and would-be settlers are obliged to write to Toronto, whereas had the meteorological service agents, been devoting their whole time to the work of the service in each of the capital cities, Winnipeg, Regina and Edmonton, much time would be saved. I strongly favour such a move and hope that the provision will be made in the next parliamentary appropriation for carrying out this improvement.

INSPECTION OF STATIONS.

The following stations were inspected by Mr. B. C. Webber:—Quebec, Halifax, St. Johns, Newfoundland, St. Georges bay, North Sydney, Sydney, Louisburg, Charlottetown, Murray Harbour, Chatham, Bathurst, Shippegan, Dalhousie, Paspébiac, Ste. Adélaïde Pabos, Grand River, Cape Cove, l'Anse au Beaufils, Percé, Barachois de Malbaie, Fox River, Gaspé and Bermuda. At Quebec, clocks and meteorological instruments were examined and the former were found out of adjustment and required cleaning. At Halifax, the time ball apparatus and meteorological instruments were examined and reported upon. At St. Johns and St. Georges bay, the barometers were cleaned and adjusted. At North Sydney, repairs to fence, &c., were ordered. At Charlottetown, a new anemograph was ordered and a new signal shed was constructed. At Chatham the barometer was cleaned and adjusted and the position of the signal mast reported upon. At Bathurst and Shippegan, N.B., the signal masts were moved to new sites. At Dalhousie, a shed for the signals was ordered. At Paspébiac, the painting of the signal mast and repairs were ordered. At Grand River, instructions were given for the repair of the signal shed roof. At Barachois de Malbaie, the agent was instructed as to his duties. At Fox river, instructions for painting the signal house and fence were given and the straightening and painting of mast was ordered. At Prospect, Bermuda, a new site was chosen for the station and a change of observers was made. At other stations recommendations were made for the improvement of their condition.

The following stations were inspected by Mr. W. D. Allan:—Banff, Glacier, Kamloops, Agassiz, Vancouver, Victoria, Saugeen, Pelee Island, Wallaceburg, Ridgetown, Woodstock, Orillia and Collingwood. At Banff instruments were tested both at the Mountain and Valley stations. At Kamloops, the barometer was repaired and compared with standard. At Agassiz, instructions were given for better exposure of thermometers. At Vancouver, the painting of the time gun shed was ordered. At Victoria, the barometer was compared with the standard instrument. At Southampton, instructions were given to obtain tenders for the erection of a signal shed; a new anemometer was installed and the barometer was cleaned. At Wallaceburg, thermometers were placed in position. At Ridgetown, the station was closed and instruments were carried away. At Woodstock a new anemometer was set up, and the painting of the thermometer shed and screen was ordered.

SESSIONAL PAPER No. 21

The following stations were inspected by Mr. W. E. Jackson:—Collingwood, Meaford, Owen Sound, Wiarton, Saugeen, Kincardine, Goderich, Bayfield, Pelee Island, Sarnia, Amherstburg, Port Stanley, Sault Ste. Marie and Tobermory. At Collingwood instructions were given for the alteration and repair of the signal shed. At Owen Sound, the signal apparatus was put in order. At Wiarton, Goderich and Southampton, instructions were given for painting the signal masts. At the latter station, the meteorological instruments were also put in order. At Bayfield, instructions were given to obtain tenders for the repairing, painting and removal of mast. At Pelee Island and Port Stanley, the meteorological instruments were put in order. At other stations not referred to, minor instructions were given and suggestions made for the improvement of the observations, &c.

The following stations were inspected by Mr. H. V. Payne:—Arden, Renfrew, Oliver's Ferry, Westport and Port Stanley. At the four first stations mentioned, the rain gauges were examined and reported on. At Port Stanley, instructions were given for the re-erection of the Instrument tower and damaged instruments were returned to store.

Mr. E. Baynes Reed inspected Dawson City, Y.T., and Atlin, B.C. At the latter station instruments were installed and the observer instructed as to his duties.

TIME SERVICE AND SOLAR OBSERVATIONS.

During the year ending June 30, 1906, 61 stellar observations for time were made in the meridian with the transit instrument, also four solar observations were taken. The position of the stars used were those given in the Berliner Jahrbuch. The collimation error of the transit instrument has been determined frequently from micro-metrical measurements on the collimating telescope and by reversal on Polaris and other stars. This error still remains almost constant. The mounting of the transit instrument remains in a very satisfactory condition, the variation in the azimuth and level errors being very small.

The time exchanges with Montreal, Quebec, and St. John have been carried on as usual and registered on the chronographs at Toronto, Montreal and St. John. The errors of the Toronto clock and of the time pieces used by the different observers elsewhere are computed from the latest observations. Both the sidereal and mean time clocks of the Toronto observatory with their various electrical appliances have continued to work well and give great satisfaction.

The following table shows the difference between the time by 'Standard Observer' and that given at the various exchanges. The sign indicates that the time sent from the different Observatories is faster than that by 'Standard Observer.' The time by 'Standard Observer' is the arithmetical mean of the times determined at Toronto and Montreal.

With the equatorial telescope the sun spot observations have been continued, maps of the sun's surface four inches in diameter being obtained on 118 days. A large spot with double nucleus followed by small trailing spots appeared on the sun from July 5th until it disappeared around the west limb July 22nd. No group of importance appeared on the sun until October 9th, when a moderate sized spot a little north of the equator appeared, being central on the 14th and disappearing over the west limb on the 20th October. This spot was followed by the largest disturbed area of the year, appearing north of the equator on the east limb October 13th, becoming central October 20th, at which time it presented a fine appearance in the telescope, being composed of several large nuclei with a multitude of small spots and faculae 100,000 miles long by 75,000 miles wide. A large single spot with a long oblong nucleus followed the large group, appearing on the east limb on October 20th. The large group reappeared at the next revolution but was broken up into fragments and scattered longitudinally over a great extent of the sun's surface. A rather large scattered group of small spots became central on the sun's disk November 30th, from which time until March, 1906, the sun's surface was comparatively free of spots with the exception of a few small ones here and there, although at no time was the sun observed free of spots except on July 27th, 1905. During March and the early part of April, 1906, several scattered and fairly large groups both north and south of the equator were visible, and at the end of year June 30th there were five small groups north of the equator and one south. These spots extended from the eastern limit to the sun's central meridian.

SEISMOLOGICAL OBSERVATIONS.

The Toronto and Victoria Milne Seismographs have been kept in successful operation throughout the year, and some very interesting earth tremors have been recorded. Bromide copies of all important disturbances have been struck off and these, together with a table giving the measurements of all movements small and great, were forwarded to the Seismological Committee of the British Association, London, and to various scientific men interested in Seismological investigation.

There are some forty instruments of a pattern similar to that used in Canada in various countries and the disastrous earthquakes and volcanic eruptions of the past year have given an additional interest to the study of earth movements, as indicated by such instruments.

During the year 102 disturbances, large and small, were recorded at Toronto, and 97 at Victoria. The most important of these occurred on July 9 and 23; January 24 and 31; April 10 and 18. All of these records were caused by violent earthquakes in various parts of the world, but naturally the most interest attaches to the last of the series, as the movement of the pendulums was in response to the tremors and earth billows which originated near San Francisco when that city was destroyed by earthquake. Prints of the seismograms obtained are shown at the end of this report.

THE UNITED STATES WEATHER BUREAU.

In conclusion I desire to place on record my entire appreciation of the very friendly and harmonious relations existing between the Canadian Meteorological Service and the United States Weather Bureau. The exchange of reports continues as heretofore and all communications are characterized by the utmost good will and a most evident desire for mutual co-operation.

All of which is respectfully submitted,

R. F. STUPART,
Director.

APPENDIX A.

METEOROLOGICAL SERVICE, ST. JOHN OBSERVATORY,

ST. JOHN, N.B., September , 1906.

R. F. STUPART F.R.S.C

Director, Meteorological Service.
Toronto, Ont.

SIR,—I have the honour to present my annual report on the St. John Observatory for the fiscal year ending June 30, 1906.

The routine of meteorological observations, records and reports has been continued without change from my previous report. The electric recording and other instruments are in excellent condition and are giving good service.

The morning weather bulletin has been issued on each week day throughout the year. It is posted in prominent places, distributed through the mails and published by the evening newspapers. The information of weather conditions and the Toronto forecasts contained in the bulletin have become a necessity to mariners, shippers and other business interests affected by weather changes. Much favourable comment from the press and otherwise was made on the reliable forecasts and warnings of dangerous gales during the past stormy season. The forecasts and warnings are also sent locally by telephone and frequent requests for information from mariners and others are received and answered at all seasons.

During the year, observations of standard stars were made with the meridian telescope on 107 nights for determination of the errors and rates of the standard sidereal clocks. The observations, clock comparisons and time exchanges have been registered on the chronograph.

The daily time signals have been regularly transmitted, are well known all over the maritime provinces and continue to be most useful to navigators, railways and the general public. Practically all the time pieces of this section of the Dominion are regulated by our standard clock. The telegraphic connections and standard clock being always available, special signals are frequently requested by navigators for rating their chronometers. Time is also sent by telephone to our local chronometers and watchmakers.

By courtesy of the superintendent of the Western Union Telegraph Company here the usual new year's eve signal was transmitted at 6.00 P.M. on December 31, enabling caretakers of public clocks and others to correct their time pieces.

The time balls at St. John and Halifax have been dropped each week day at 1.00 P.M., 60th Meridian time. The clock in St. John post office lobby, which is connected by wire with one of the mean time clocks, has been hourly corrected throughout the year. I understand it is intended to extend this service to other departmental offices.

On August 23 I inspected the time ball apparatus, clocks and electric connections at Halifax. Some slight change was made in the electric clock connections. The clock at Halifax has been synchronized daily without failure and is doing its work well. To keep a check on this clock a return signal during late afternoon or at night is registered on the chronograph here with our standard clock, the error at most times being inappreciable.

The clock room in basement was completed early in the spring. The inner room is plastered on all sides with asbestos cement, lined with sheathing enamelled white. The clock piers are of brick, capped with sandstone. The outside wall is of brick,

6-7, EDWARD VII., A. 1007

leaving about 18 inches of air spaces between the wall and inner room. The Kulberg and Riefler clocks were installed last May. The inner room is kept at an even temperature by means of a Thermostat, Advance Electric Gas burner and pilot light. So far it has been possible to maintain the room within 1 degree of 73 Farh. The glass case of the Riefler clock was hermetically sealed and pressure reduced to 680 mm. by the air pump. Since the temperature has been kept uniform there has been no trouble in maintaining constant pressure in the clock case. This fine clock is now running with almost perfect accuracy. Both clocks are connected by cable with the switch board and chronograph in the office upstairs.

I have the honour to be, sir,
Your obedient servant,

D. L. HUTCHINSON,
Director, St. John Observatory.

APPENDIX B.

QUEBEC OBSERVATORY,
QUEBEC, August, 1906.

The Director,
Meteorological Service, Toronto.

SIR,—

I have the honour to transmit my annual report for the fiscal year ending June 30th, 1906.

The time ball on the citadel is in very good working order, and it was dropped daily during navigation season as heretofore.

All the necessary repairs, which I mentioned in my last report, were made during last winter, before the opening of navigation.

At the observatory the two clocks were cleaned and repaired, also the anemograph which was broken.

I continue to perform the duties of my office as in the past, and the instruments are kept in good working order.

I have the honour to be, sir,
Your obedient servant,

ARTHUR SMITH,
Director.

MAGNETIC OBSERVATORY,
TORONTO, September 19, 1906.

LT. COLONEL F. GOURDEAU,
Deputy Minister of Marine and Fisheries,
Ottawa.

SIR,—

I have to report that during the fiscal year ended June 30th, 1906, there has been no change in the equipment of the observatory.

Mr. William Menzies has been continued in immediate charge of the observatory and makes the following general report regarding the routine work.

The regular photographic curves of declination, horizontal force and basement temperatures have been maintained throughout the year without other loss than twelve hours of the Bifilar curve which was occasioned by the cylinder not being properly in

SESSIONAL PAPER No. 21

gear and occurred during my absence in Labrador. These curves have been measured at hourly intervals and at times of the greatest excursion the results tabulated, meaned and reduced to absolute values in C.G.S. units for publication.

The absolute observations of declination, inclination and horizontal force have been taken at stated intervals and results compared with the photographic curves and scale readings of the differential instruments in the usual manner. Special magnetic data and copies of curves have been furnished to directors of foreign observatories and other correspondents, as may have been requested by them. Accurate times have been assured by weekly time exchanges with Toronto observatory.

The usual meteorological observations consisting of maximum, minimum and incidental readings of temperature, anemographic records of wind velocities and directions, measurements of rainfall, state of weather, &c., &c., have been regularly taken.

It having been deemed advisable that magnetic and meteorological records should be obtained at the solar eclipse station at Northwest river, Labrador, both during and prior to the time of totality, application was made to the Dominion Government for permission that an observer with the necessary instruments should accompany the expedition which was to be fitted out under the direction of Dr. W. F. King, the chief Dominion astronomer. The Honourable the Minister of Marine and Fisheries having granted the necessary authority, and Dr. King having accepted the assistance offered, I deputed Mr. William Menzies to accompany the expedition. It was deemed altogether expedient that the various instruments used should be self-recording and should be as follows: A declinometer to show the variations in the declination of the magnetic needle; a Bifilar magnetometer to register the changes in the horizontal component of the earth's magnetism; also a barograph and a thermograph.

In order that the magnetic instruments should record photographically, it was necessary to provide a dark shelter for them, and Mr. Menzies undertook the construction of a suitable shelter and the various mechanical contrivances necessary for adapting our instruments to the peculiar circumstances. Scale values and details of instrumental adjustment were determined by myself. A full description of the shelter and the installation of the various instruments may be found in 'The Transactions of the Royal Astronomical Society of Canada for the year 1905.' Although the sun was obscured during the time of the eclipse and a very pronounced magnetic disturbance made it impossible to detect any eclipse effect on the movements of the magnets, the magnetical records obtained in this northern station during an interval of fourteen days are a valuable contribution to the science of terrestrial magnetism.

Respectfully submitted,

R. F. STUPART,
Director.

APPENDIX No. 5.

REPORT OF THE CHAIRMAN OF THE BOARD OF STEAMBOAT
INSPECTION.

CHAIRMAN'S OFFICE,

OTTAWA, November 1, 1906.

To the Deputy Minister of Marine and Fisheries,
Ottawa.

SIR,—I have the honour to submit the annual report of the working of the Steamboat Inspection Service for the year ending June 30, 1906.

It represents the general work of the service during the time stated, giving the number of steamboats inspected in the several divisions and their gross tonnage, with the amount of dues collected from steamers employed in the carriage of passengers between Canadian ports, but registered elsewhere than in Canada, together with the fees received for engineer examinations, the names of the candidates, and their grade of certificate.

In addition to the steamboats inspected at the port of Montreal, the ships' tackle and hoisting gear used for the purpose of loading and unloading those vessels to the number of 423, were also inspected by the steamboat inspectors of that port.

NUMBER of steam vessels reported as known by the inspectors of steamboats in the Dominion, for the year ended June 30, 1906, also the number of steamers inspected but not registered in the Dominion for the same date.

Division.	Number of Dominion registered steamers.	Gross tonnage of Dominion registered steamers.	Number of steamers inspected but not registered in the Dominion.	Gross tonnage of steamers inspected but not registered in the Dominion.

BOARD MEETINGS.

April 6, 1906.—A meeting of the Board of Steamboat Inspection composed of Messrs. Dodds, McKean, Stewart, Thompson, Evans, Davis and the Chairman was convened at Toronto to deal with the question of conditions arising, due to the modern steel steamer engaged chiefly in the carriage of freight and carrying a limited number of passengers. To meet these conditions amendments were recommended to the rules relating to the boats to be carried and also the pumps necessary for fire protection.

Rules were also recommended for computing the allowable working pressure on machine made furnaces of the bulb type. These rules were approved by the Governor-in-Council on May 10, 1906, and came in force May 19, 1906.

The question of amending Section I of the rules so as to allow the Inspector discretion in applying the hydrostatic test on boilers was suggested to the Department. This question was submitted to the Board for their consideration, and the unanimous decision was that no such departure or change in the mode of inspecting from that as required by the present rules could be recommended in the interest of public safety.

Prosecutions with penalties enforced for violation of the Steamboat Inspection Act.

July 21, 1905.—A complaint was forwarded the Department that a gasoline yacht was employed at Port Burwell in the carriage of passengers, for hire, without holding the necessary certificate of inspection. The matter was referred to the Collector of Customs at that port to examine into, the result being the vessel was seized and a fine of \$50 was imposed and received by the Department.

July 25, 1905.—Steamers *Aileen* of Kingston and *Lee* of Brockville were seized by the Inspector of Hulls and Equipment for violation of the law by carrying more passengers than that allowed by her certificate of inspection. The owners were each subjected to a fine of \$100.

August 11, 1905.—The department having been informed that the ferry steamer *Argyle* plying at Kenora, Ont., was running without having a licensed engineer in charge, instructions were issued to the Collector of Customs to ascertain the facts and take action, the result of which a penalty of \$100 was imposed and a draft for same was received by the Department.

August 17, 1905.—Complaint having been made to the department of steamers running in the vicinity of Lake Massawippi, P.Q., and carrying passengers illegally, the department took steps to verify same by sending an officer to investigate. The result was legal proceedings were taken against the owner of steamer *Pocahontas*, who paid the penalty of \$150 on withdrawal of the prosecution.

October 12, 1905.—Complaint was made that the tug *Togo* was carrying passengers on the Spanish River without holding the necessary certificate of inspection. The Collector of Customs was advised of same, whereon the steamer was seized, the captain pleading guilty, a fine of \$50 was imposed.

December 19, 1905.—The Collector of Customs at St. John, N.B., imposed a fine of \$50 on the steamer *Wilfred C* of Halifax for an infraction of the Steamboat Inspection Act by running without having the necessary certificate of inspection for the current year, which fine was remitted to the department.

July 30, 1906.—A fine of \$100 was imposed by the Collector of Customs at St. John, N.B., on the Norwegian steamship *Veritas* for an infraction of the Steamboat Inspection Act, by carrying cargo between two Canadian ports without being inspected; a draft for same was received by the department.

CASUALTIES.

The following are the casualties reported from the several divisions as having occurred during the year ending June 30, 1906.

TORONTO DIVISION.

August 9, 1905.—The steamer *Erin*, of St. Catharines, while passing through the Detroit river, when abreast of Sandwich, broke the connecting rod, the piston carrying away the intermediate head between the high and low pressure cylinders, also the top head flange of high pressure cylinder and throttle valve. The escaping steam from the steam pipe caused the death of the assistant engineer who was on duty at the time.

September 19, 1905.—While the steamer *Melbourne*, of Port Stanley, was lying at the Bay of Quinte entrance to Murray canal, she took fire and was totally destroyed. Cause of fire unknown.

April 30, 1906.—The tug *Clipper*, of Toronto, en route from Midland to French river, sprang a leak when near the Bustard islands and foundered. The crew numbered four, of which only one reached shore in safety. The vessel has been raised and rebuilt and is again in commission.

May 31, 1906.—Steamer *Erin*, of St. Catharines, when about opposite Courtright, on the St. Clair river, was run into by the United States steamer *Jno. B. Cowle*, and instantly sank and three of her crew were drowned. The steamer has been abandoned.

COLLINGWOOD DIVISION.

August 12, 1905.—The screw tug *Gertie C.*, of Toronto, was destroyed by fire at Dyer's bay, Ont. No casualties.

September 5, 1905.—The steamer *Shamrock*, of Collingwood, was in collision with United States steamer *Richardson* near Point aux Pins, which resulted in the sinking of the steamer *Shamrock* and the drowning of the master and engineer. The steamer has since been raised and repaired.

September 12, 1905.—The screw tug *A Seaman*, of Toronto, was burned near Cape Croker. No casualties.

October 2, 1905.—The screw tug *Signal*, of Collingwood, was destroyed by fire near Midland. No casualties.

November 1, 1906.—The fishing tug *Surprise* of Sault Ste. Marie, was burned at Cook's bay. No casualties.

November 17, 1905.—The tug *W. J. Martin*, of Midland, was burned at Twelve Mile bay. No casualties.

SESSIONAL PAPER No. 21

KINGSTON DIVISION.

On the night of July 11, 1905, the steamer *Ellen*, while lying at the dock at Cardinal, Ont., took fire, totally destroying her upper works, which were rebuilt immediately. Cause of fire unknown, there being no person on board at the time.

On June 9, 1906, the steamer *Argyle*, while on a trip from Oshawa to Toronto, broke her main crosshead guide, and side link, also bending the piston rod; she was towed to Toronto and repaired. No loss of life occurred.

On the night of June 14, 1906, the steamer *Manita*, while lying at her dock at Bobcaygeon, was partially destroyed by fire. There being no person on board at the time, cause of fire is unknown. The steamer was immediately rebuilt and placed again in commission.

MONTREAL DIVISION.

March 17, 1906.—The steamer *Sovereign*, of Montreal, 637 gross tons, while lying in winter quarters at Lachine, took fire during the night and was totally destroyed. There were a few carpenters working on board during the day, and it is supposed the origin of the fire was through carelessness on their part.

QUEBEC DIVISION.

Casualty returns, nil.

NEW BRUNSWICK AND PRINCE EDWARD ISLAND DIVISION.

November 19, 1905.—The steamer *Clifton*, of St. John, N.B., gross tonnage, 138, while lying at Reed's point wharf, Kingston, N.B., caught fire and became a total loss. The fire is supposed to have originated from the furnaces.

March 16, 1906.—The passenger steamer *Beatrice E. Waring*, of St. John, N.B., 593 gross tonnage, while lying at her wharf in winter quarters, caught fire from some unknown cause and was totally destroyed.

May 18, 1906.—The piston rod of steamer *Neptune* broke, due to an old flaw developing where fitted into cross-head, the piston carrying away broke the flange off the top end of the cylinder. A new rod and cylinder were fitted at St. John, N.B.

NOVA SCOTIA DIVISION.

August 18, 1905.—On steamer *Halifax* one of the fore-and-aft stays below furnaces broke without warning, close to inside of the head sheet of port boiler, blowing out the piece attached to nut, allowing the stay to drop down when the stoke hold was filled with boiling water, causing the death of one fireman; the stay, upon examination, showed an old fracture, which was impossible to detect prior to the accident.

December 4, 1905.—The SS. *Lunenburg*, of Lunenburg, N.S., 266 tons gross, while on a voyage between Pictou and Magdalen islands, was stranded on Grindstone island and became a total loss, twelve of the passengers and crew being drowned.

January 9, 1906.—SS. *Richards* of Montreal, 466 tons gross, on a voyage between Hastings and Yarmouth, N.S., was stranded near Cape Blanche and became a total loss. No lives were lost.

March 10, 1906.—SS. *Baines Hawkins*, of Sydney, N.S., 703 tons gross, on a voyage from Port Morien to Halifax collided with ice near Scattarie island and sank shortly after, one of the crew being lost.

April 26, 1906.—The steamer *Havana*, of Windsor, N.S., while lying at anchó after dark in Halifax harbour, was run into by the steamer *Strathcona* and sank in a few minutes, becoming a total loss. No lives were lost.

June 2, 1906.—The steamer *Florence C.*, of Halifax, 39 tons gross, while attempting to enter Tor Bay, N.S., was stranded and became a total loss. No lives lost.

5-6 EDWARD VII., A. 1906

MANITOBA AND NORTHWEST TERRITORIES DIVISION.

October 7, 1905.—The steamer *Monarch*, 113 gross tonnage, while lying at her dock at Rainy River, was partially burned. The machinery has been taken out and boat put out of commission. Cause of fire not known.

August 19, 1905.—Steamer *D. A. Gordon* 148 gross tons, while lying at Canadian Northern dock, Port Arthur, at 4 a.m., caught fire and was partially burned. The machinery has been taken out and hull converted into a barge. Cause of fire unknown.

March 31, 1906.—Steamer *Kaministiquia*, of 150 gross tons, while lying in her winter quarters at Port Arthur, caught fire and was burned to the main deck, at the hour of 11.00 P.M. It is supposed to have been done by tramps taking shelter on board; the boat has since been rebuilt and put into commission again.

BRITISH COLUMBIA AND YUKON TERRITORY DIVISION.

April 4, 1906.—SS. *Selkirk*, of Victoria, B.C., 142 gross tons, stranded on Jones island at 4 A.M. Two days afterwards she filled with water and sank in ten fathoms; she was subsequently raised, brought to Victoria and put in a seaworthy condition, after which she again went into commission June 30.

The stern-wheel steamer *Cheam*, of New Westminster, B.C., 286 gross tons, employed in towing on the upper Fraser river, was wrecked by running on a snag. The water was falling at the time, the result of which the vessel broke in two.

I am, sir, your obedient servant,

E. ADAMS,
Chairman Board of Steamboat Inspection.

SESSIONAL PAPER No. 21

APPENDIX No. 6.

ANNUAL REPORT OF THE SIGNAL SERVICE, 1905-06.

REPORT received from Mr. J. U. Gregory, Agent, Department of Marine and Fisheries relating to the Signal Service for the year ending June 30, 1905.

OFFICE OF THE SUPERINTENDENT,
QUEBEC, November 14, 1906.

As in previous years, reports have been received from the different signal stations in the river and gulf of St. Lawrence, recording the weather, wind and condition, location and movement of the ice during the winter and spring months, and during the season of navigation all inward and outward bound vessels, as signalled when passing each station. These reports have been distributed to the Boards of Trade at Montreal and Quebec, and to the Chamber of Commerce at Halifax, also to the press of Montreal and Quebec, to the agent of the Department of Marine and Fisheries at Quebec, Custom House, Immigration Department, steamship agents, tug owners, pilots, Lloyds' agents and a great many others. The superintendent of the quarantine station at Grosse Isle is also supplied with full information as to weather and wind, and the incoming of all transatlantic or foreign vessels, and the quarantine doctor at Rimouski with reports of the incoming mail steamers, names of stations and hours of passing same. Information was also supplied from this office, as in past seasons, to the signal agents at Anticosti, Magdalen Islands, Meat Cove, Cape Ray and Cape Race during April and May in regard to the weather, wind, and condition and movement of the ice in the river and gulf of St. Lawrence for the guidance of vessels calling for information. During the first ten days of March the Deputy Minister of Marine at St. Johns, Newfoundland, was supplied with information of the weather, wind and location of ice by the signal agents at Anticosti, Magdalen Islands, Meat Cove, St Paul's Island, Cape Ray and Belle Isle, for the guidance of the Newfoundland sealing fleet.

All vessels showing their distinguishing signals are reported by the different signal stations immediately, and such reports are promptly posted on the bulletin boards of the Great Northwestern Telegraph Company at Quebec and Montreal. The signalling of vessels has been greatly facilitated by the establishment of Marconi wireless telegraph at different points in the river and gulf of St. Lawrence, although the number of vessels fitted with the wireless system is small as yet.

HERBERT S. McGREEVY,
Superintendent of Signal Service.

APPENDIX No. 7.

REPORT OF MARINE SCHOOLS.

OTTAWA, CANADA, May 21, 1906.

The Deputy Minister of Marine and Fisheries,
Ottawa, Ont.

I have the honour to submit the annual report upon the various marine schools established at the following shipping centres of the Dominion:—

Victoria, B.C.
Kingston, Ont.
Montreal, P.Q.
Quebec, P.Q.
North Sydney, N.S.
Halifax, N.S.
Lunenburg, N.S.
Yarmouth, N.S.
St. John, N.B.

The establishing of marine schools where seafaring men could gather more knowledge about the various subjects pertaining to this calling, was first instituted during the winter of 1903-4, when schools at the following places were opened:—Victoria, Halifax, St. John and Yarmouth. During the season of 1904-5, the number of schools were not increased, as the idea was still in its infancy.

Owing to the encouragement received, the department determined to open schools at Kingston, Montreal, Quebec, North Sydney and Lunenburg; all these schools were well attended, particularly at Kingston and Quebec.

The programme of subjects discussed was uniformed and based upon the system which had been followed at the marine school at Montreal, when under the auspices of the Société St. Jean Baptiste. Each school has been supplied with the most necessary objects for demonstration, but owing to the short notice which was given me to control these schools, the complement of furnishings has not yet been supplied. The lecturers at these schools are, but with one exception, the examiners of masters and mates, who are fully qualified to discuss maritime affairs.

During this season's lectures, special attention has been paid to the explanation of the 'rule of the road' and the deviation and correction of compass, which are the most important technical subjects of a navigator's education.

These schools have been extremely beneficial, especially to our sailors navigating fresh waters; they are also appreciated by foreign-going navigators, but not to such an extent as in the case of fresh water sailors; explanations of the various subjects are necessarily of an elementary nature.

The schools were not established for the purpose of preparing or coaching candidates for the various examinations, but to give those who follow or intend to follow the sea an insight into the various technical subjects which come under the heading of seamanship.

The teaching given at these schools will tend to raise the efficiency of our inland navigators to a satisfactory degree and I fully anticipate similar results with deep water navigators.

SESSIONAL PAPER No. 21

A statement showing the amount of attendance is herewith attached. It will be seen by the statement that the total attendance was 3,954 persons, which is certainly encouraging and in view of the results already achieved, I would recommend that schools be opened at the following places:—Toronto, Vancouver, Charlottetown or Pictou; Windsor or Sarnia; and Goderich or Collingwood.

MARINE AND FISHERIES, CANADA.

REPORT

ON THE

RIVER ST. LAWRENCE SHIP CHANNEL

FROM

MONTREAL TO QUEBEC AND FATHER POINT.

F. W. COWIE, B.A. Sc., M. CAN. Soc. C.E.,

Superintending Engineer.

MARINE AND FISHERIES, CANADA.

RIVER ST. LAWRENCE SHIP CHANNEL.

OTTAWA, ONT., December 15, 1906.

SIR,—According to your instructions, I beg to present the following annual report on the operations for the improvement of the River St. Lawrence Ship Channel during the fiscal year ended June 30, 1906.

As usual, although the dredging reports and the cost and details of the work are made for the fiscal year, the general information, which is of great importance to the navigation interests, is completed to the date of writing, or the close of the season of navigation.

The announcement of the completion of the 30 foot channel between Montreal and Batiscan, which, by taking advantage of the tides to Quebec, gives a depth for navigation between Montreal and Quebec of 30 feet at extreme low water, cannot fail to be of great satisfaction to those interested in the St. Lawrence route.

It is with very much pleasure that I acknowledge the great measure to which the success of the operations is due to the untiring and loyal work of the staff of engineers and crews of the various vessels engaged on the work.

I have the honour to be, sir,

Yours obediently,

F. W. COWIE,

Superintending Engineer.

Lieutenant-Colonel F. GOURDEAU,
Deputy Minister of Marine and Fisheries,
Ottawa, Ont.

APPENDIX No. 12.

RIVER ST. LAWRENCE SHIP CHANNEL.

INTRODUCTION.

The ship channel of the River St. Lawrence, between Montreal and Father Point, has a total length of about 340 statute miles.

Navigation throughout this distance is under the control of the Montreal and Quebec pilots.

The contracted part of the river, which may properly be called ship channel, commences at the Traverse, to which point, from Montreal, the distance is 220 miles.

The length of channel actually requiring improvement by dredging from Montreal to the Traverse, is about 70 miles. The length of the 30 foot channel actually completed, at the date of writing, the close of navigation, 1906, is 56 miles; leaving 14 miles yet remaining to be dredged, in order to give a clear depth of 30 feet at low tides during the lowest stage of the river level.

From Montreal to Batiscan the tide is not available for navigation, and in order to enable vessels to load to full depth, the dredging of this part of the river was first undertaken.

At the close of the season of 1906 we are able to announce the completion of the channel to a depth of 30 feet at the extreme low water of 1897, between the points above mentioned, viz.:—Montreal and Batiscan. As the E.L.W. of 1897 was six inches lower than the level reached last season, the minimum depth found in the 30 foot channel, in 1906, was 30 feet 6 inches.

The completed channel has a minimum width, in the straight portions, of 450 feet, and on the curves from 500 to 750 feet. The widening has all been completed, except for a distance of 12.30 miles in the straight portions of Lake St. Peter.

As the dredging is completed the channel is swept and, therefore, with the above announcement, an available depth of 30 feet exists from the sea to Montreal, advantage to be taken of the tide up to Batiscan.

The whole of the dredging plant will now be concentrated on the work of obtaining a greater width in Lake St. Peter and the tidal parts of the river, as well as the full depth of 30 feet at low tide. About an equal quantity of work requires to be done below Quebec and above Quebec.

In 1905 the commencement of construction was made of a large steel, sea-going, hydraulic hopper dredge, for the work below Quebec. The dredge is being built at Sorel. It was launched on December 1, 1906, and it is expected will be ready for work, as already stated, early in the season of 1907.

As the tonnage and size of vessels has made such rapid increases, it was decided that it would be unwise to wait so long, before the commencement of improvements below Quebec. Owing to the exposed locality, the strong and changeable currents, and the great rise and fall of the tides, the ordinary type of dredge in this country is not suitable for this work. The English or European sea-going dredge being the type required.

Inquiries were made in England for a suitable dredge, for immediate delivery. Messrs. H. E. Moss & Company, of Liverpool, England, offered a sea-going, suction, hopper dredge, built in 1904, at a very reasonable figure. After inspection, the purchase of this dredge was concluded, and she was brought from New Orleans to the St.

SESSIONAL PAPER No. 21

Lawrence in June, 1906. After being overhauled and damage to the hopper gates repaired, this dredge was taken down below Quebec and put to work on the Beaujeu Bank, and before the close of the season removed about 100,000 cubic yards of sand and soft clay.

The season just closed has also marked the construction in England and the bringing to the St. Lawrence of a powerful and well-equipped ice-breaking, surveying and sweeping tug.

It is probable that no other action on the part of the government, in the way of making navigation safer, could contribute more to improvement in the excessive insurance rates which have been so detrimental to the St. Lawrence route.

On her first trip after being put into commission, while on an inspection and consultation trip with the Minister, the Officers of the Department, the Shipping Federation of Canada, the Presidents of the Boards of Trade of Montreal and Quebec on board, this vessel relieved from a very dangerous position at Cap à la Roche a steamer, which, with its large cargo, was estimated to have a value of \$1,000,000.

By its timely aid the vessel was floated before any serious damage had been done to the ship's bottom, and the Donaldson Liner *Athenia* was able to proceed on her voyage to Glasgow without more delay than a few hours, and apparently without injury.

Although the water in the St. Lawrence reached a stage considerably lower than usual, the season just closed was marked by an almost complete freedom from serious accidents.

It is probable that between Montreal and Quebec, during the season of 1906, the total losses, including salvage assistance, would not amount to much more than the very insignificant sum of \$1,000. Surely nothing could be a greater indication of the safety of the Ship Channel and the skilfulness and care of the pilots than such a record, in a length of channel of 160 miles, navigated up and down by nearly a thousand ocean-going steamers.

The Shipping Federation of Canada and the Montreal Board of Trade having petitioned the Minister, urging the utmost vigour in the prosecution of the work, the construction of an additional dredge for Cap à la Roche has been commenced. This dredge has been carefully designed, with sufficient power to attack the banks at Cap à la Roche and Cap Charles, where the material is soft shale rock, and where the widening is urgently required.

The members of the Shipping Federation of Canada, and the Presidents of the Boards of Trade of Montreal and Quebec, accompanied the Minister and Officials of the Department, during the month of November, 1906, on the annual inspection of the Ship Channel, between Montreal and Crane Island.

Three days were occupied in observing the work, discussing the merits of the proposed plans, and considering the various recommendations.

Resolutions of approval of the Departmental programme have been received, together with the thanks of these important Corporations, for having been afforded an opportunity of actually observing the conditions, and placing their recommendations before the Department.

At the close of the season of navigation the dredge *Galveston*, instead of being laid up at Sorel, was sent to St. John, N.B., in order to do some urgent work required during the present winter, to enable the large vessels to use the Intercolonial berths.

The season just closed has been a very arduous one, and in view of the success of the work, and the record of navigation, too much recognition of their services cannot be given to the Officers of the Staff, especially Mr. G. J. Desbarats, Director of the Shipyard at Sorel, who has the direction of the construction and repairs to the plant; Mr. V. W. Forneret, C.E., who has general local charge of the dredges, and Mr. N. B. McLean, C.E., who conducted the sweeping operations, together with the other members of the Staff, as well as the Captains and Engineers of the Dredging Plant.

PHYSICAL FEATURES.

It is probable that there is no river in the world better adapted for improvement than the St. Lawrence.

The Great Lakes act as storage reservoirs and settling basins.

Except for floods during the ice accumulations, the fluctuations in level are gradual and not excessive.

The position of the St. Lawrence is the reverse of most rivers. The usual condition of a river is, from the source, steep slopes which erode the banks and transport coarse material, which, as the slope becomes more gradual, decreases until at the mouth of the river the water carries in suspension a fine sediment which deposits, to the great detriment of navigation.

In the St. Lawrence the material from most of the sources of supply is all deposited in the settling basins. From the lakes to the ocean the bottom of the river is usually hard, so that we have not only clear water, but a permanent river bed.

The nature of the material composing the bottom of the river, though in many places very difficult to dredge, is for the same reason of such a character that a dredged cut once made is substantially permanent.

In the ship channel the material to be excavated varies from soft blue clay into which a pole may be planted some 6 or 7 feet by hand, to stiff clay, to hard pan as hard as a macadamized road, to shale rock and large boulders. In one or two localities we find coarse sand, at which points dredging has to some extent to be repeated.

Below Quebec, at the localities where the fresh and salt waters meet, there are the usual sand bars. The best information goes to show that these shoals are not increasing. As the size and draught of ships increase, as well as the competition in speed, detention while waiting for the tide to pass these bars is more apparent; and it is urgent that a clear depth of 30 feet at low tide be obtained as soon as possible.

The movable nature of the material, added to the lack of uniformity of the tides, currents and salt water, results in more instability in the shoals below Quebec. It is therefore expected that the maintenance of the excavated channels, there, will require some annual re-dredging.

The currents of the St. Lawrence are, for a river of such a size, not only reasonable and regular, but altogether free from the usual dangers to navigation resulting from freshets.

The winter season, with its ice and snow, is the one great drawback to the St. Lawrence. This route, however, with its 7 months season of navigation, is one of the greatest factors in the success of the Canadian transportation system.

KEEPING PACE WITH THE SHIPPING.

The St. Lawrence, owing to its situation, is the natural gateway from the Atlantic to at least one-third of the continent of North America.

In 1844 it was in an effort to give navigation to Montreal for vessels of 500 tons that the first work of dredging was undertaken.

The work is still considered one of the great river improvement works in the world. The plant is up-to-date. In many respects it leads, in design and economy. The organization, staff and dredge officers are a result of the training of some of the most skilled engineers of the times.

The early surveys and designs were made under the direction of English and Scotch engineers, and the first dredge machinery was built in Glasgow.

Since 1874, however, all the engineers and superintendents, and probably all the men, have been Canadians, and the dredges designed and built in Canada.

The aim is to give a safe and ample waterway for ships suitable for the commercial requirements of the trade and route.

The channel does not afford the usual difficulties of canal navigation. There is sufficient water on the banks to minimize induced currents which, when the cross section of the ship is large in proportion to the cross section of the channel, makes safe steering at ordinary speed difficult.

SESSIONAL PAPER No. 21

The ratio between the cross section of the Suez Canal, at its section of minimum dimensions, to a ship of the size of the Canadian Pacific Railway 'Empresses,' is about 3 to 1.

The cross section of the 8-mile Culebra cut of the proposed Panama Canal is, in the most liberal proposition, only 8,000 square feet, and it is very probable that the canal will be opened for traffic with the channel having a cross section very much less than that, and intended for the largest ships afloat.

The River St. Lawrence at Cap à la Roche, the narrowest point, will have a minimum cross section, when the 30 foot channel is completed, of about 80,000 square feet in the length of 3 miles of rock cutting.

The Ship Channel has, therefore, many advantages over most other artificial water routes, not only as to tonnage capacity, but for safe steering at a reasonable speed. The *Victorian* and *Virginian*, the largest ships reaching Montreal, have frequently made the voyage to Quebec in less than 10 hours, without trouble.

In canals it is a well known rule that when the speed of a large ship becomes too great, the currents induced by the passage of the vessel result in forces acting on the bow which increase the more the vessel is out of the centre of the canal, so that all the power of the rudder and twin-screws will not bring the ship back. This is what is called 'taking a sheer,' and it explains the apparent paradox in the steering of vessels in contracted canals, because usually a ship obeys her helm more readily when the engines are at full speed, owing to the increased action of the water from the screws on the rudder.

For vessels of large size, in the narrow cuts, during low water, we urge that a moderate speed, sufficient to keep a ship under full control, is a matter of the greatest safety.

The Suez Canal has a length of about 100 miles. Its width, at the bottom, is at many places only 118 feet and, at the top, from 190 to 330 feet, yet it is regularly used by P. & O. liners with a length of 500 feet, a breadth of 54 feet and a draught of over 27 feet. At certain stages of the tide they also have a current of $2\frac{1}{2}$ knots.

Although the Suez Canal has magnificent financial resources, it is not being enlarged with anything like the rapidity of the River St. Lawrence Ship Channel.

In the last 10 years the general size and tonnage of vessels have increased quite 100 per cent. It is expected that the 10 years commencing in 1900 will see the Ship Channel enlarged, from a minimum width of 300 feet and a depth of 26 feet 2 inches, to a minimum width of 450 feet, with a depth of 30 feet, which is no more than keeping pace with the shipping.

HISTORY OF THE WORK.

The agitation for the deepening of the channel in Lake St. Peter, so as to permit all ocean vessels to come up the St. Lawrence to Montreal, commenced about the year 1825.

The actual work of dredging commenced in 1844, the machinery of the first dredge having been brought from the Old Country.

The dredging was commenced as a Public Work. The location of the first channel, however, did not give satisfaction, and the work was stopped.

The Montreal merchants finally concluded that they could conduct the work more satisfactorily and pay the interest on the cost by a tax on the shipping.

Legislation was passed in 1850, transferring the plant to the Montreal Harbour Commissioners and authorizing them to proceed with the work as they should deem best.

The rate of interest paid on the cost, of the early improvements, by the Commissioners, was 8 per cent.

The minimum depth in Lake St. Peter was about 11 feet, during low water, and at first only the deepening of the lake mud flats was contemplated.

The Harbour Commissioners conducted all operations from 1851 to 1888, the improvement being found to be required at many points, extending between Montreal and Cap Charles.

A dredge in 1846 excavated in Lake St. Peter, in one day, about 1,200 cubic yards. By wonderful improvements to plant, in 1888 a dredge would excavate 7,200 cubic yards without trouble, and in 1906, working day and night, 20,000 yards was a frequent day's work.

In 1888 the channel was completed from Montreal to Cap à la Roche to 27½ feet at ordinary low water (26 feet 2 inches at the new datum, or extreme low water of 1897, which has been adopted for the 30-foot channel). From Cap à la Roche to Quebec heavy draught vessels would pass with the tide.

In 1889, in order to relieve the shipping of the heavy tonnage tax, the Government adopted the channel as a National route. The debt was assumed and the tax abolished, and the Department of Public Works continued the work.

In 1904, with a view to systematizing navigation matters, the management and control of the River St. Lawrence Ship Channel, together with the plant and Sorel Shipyard, were transferred to the Department of Marine and Fisheries.

Although on several occasions, especially in 1879, the water fell considerably below the ordinary stage of 10½ feet on the Flats of Lake St. Peter, the extraordinary low stage of 1895, and again in 1897, and the increase in the size of ships, made it urgent that the channel should be further enlarged.

In 1897 new and powerful dredging plant was commenced, with a view to further extensive improvements.

THE PROJECT OF 1899.

In 1899 the project of the 30-foot channel was adopted.

Two new dredges, with tugs, scows and barges, had been put in commission. Two more dredges were nearly completed, and two others authorized.

The low water of 1897, the lowest on record to the present date, except for a few days of abnormal low water in 1895, was adopted and it was decided to make the depth 30 feet from that low level.

The average depth in the 30-foot channel, as being dredged, was, during the season of 1906, as follows: May, 36 feet; June, 35 feet 1 inch; July, 32 feet 11 inches; August, 31 feet 7 inches; September, 30 feet 11 inches; October, 31 feet; November, 31 feet 2 inches.

The greatest depth from May to November was 36 feet 11 inches, and the least, during the month of October, 30 feet 6 inches.

Besides the increased depth, it was decided to widen the channel at least 50 per cent. The curves were to be made as flat as possible and to a width of from 500 to 750 feet. By the radical method of dredging 450 feet was about the limit for one cut, and that width on the tangents was adopted. This compares very favourably with any navigation route in the world, where the courses may be easily marked by range lights.

Between Montreal and Quebec, a distance of 160 miles, there are 62 distinct courses, or over 2½ miles each, of which already 47 are marked by range lights.

The 30-foot project was adopted in 1899; in that year with 2 new dredges, in 1900 with 4, in 1901 with 5 and from 1902 with 7 dredges, the work has been carried on with great vigour.

The completion of nearly 40,000,000 cubic yards of excavation in 10 years was the best estimate given. It is expected that this will be realized, and at the exceedingly low cost, including plant, of less than \$5,000,000.

The total cost from 1851 to the end of the fiscal year, of the Ship Channel, plant, shops, &c., is as follows:—

Dredging	\$5,929,970 44
Plant, shops, surveys, &c.	3,031,860 37
	<hr/>
	\$8,961,830 81

SESSIONAL PAPER No. 21

Before the close of navigation, in November, 1906, the 30-foot depth was completed from Montreal to Batiscan, from which point to the sea the same depth, or more, can be carried, by waiting for the tide.

Only 7.10 miles of dredging remains to be completed and although the most difficult is yet to be done, there is no anxiety but that with the magnificent plant, it will be completed well within the time expected.

With the present project completed and well marked, it is expected that an additional depth of 4 feet over the same width could be obtained in a much shorter time.

NAVIGATION CONDITIONS.

The water in the St. Lawrence, like all North Atlantic rivers, owing to the lack of rain fall, reached a very low stage during the last four months of the season of 1906.

The dredging operations do not either theoretically or practically lower the level of the water in the river. No material is removed; it is merely taken from one place and deposited opposite. As long as the water supply remains the same we can rely on the same river level.

The interests of the Harbour of Montreal and the navigation of the St. Lawrence must, however, be jealously guarded against any interference with the natural conditions, which will in the least degree diminish the natural flow, during the season of low water.

The 27½-foot depth at ordinary low water, as found in the uncompleted parts of the 30-foot Ship Channel, between Montreal and Batiscan, still governed during the past season the depth for navigation.

On October 28 a report was made, stating that as the only link between those points, then not finished to 30 feet, had been examined, an additional draught could be carried, or vessels could safely load to the full depth given by the Sorel gauge.

The average depth in the Ship Channel, available for navigation, with the greatest and least depths in each year, from May to November, since 1890, is given in the following table:—

YEAR.	AVERAGE DEPTH FOR EACH MONTH.											FROM SOREL GAUGE DURING EACH YEAR, MAY TO NOVEMBER.						
	May.		June.		July		August.		Sept.		Oct.		Nov.		Highest.		Lowest.	
	Ft.	In.	Ft.	In.	Ft.	In.	Ft.	In.	Ft.	In.	Ft.	In.	Ft.	In.	Ft.	In.	Ft.	In.
1890.....	37	6	35	3	31	9	30	6	30	9	29	9	30	6	37	0	29	0
1891.....	34	6	31	3	29	9	29	9	30	0	28	3	28	3	36	9	27	3
1892.....	31	0	31	9	31	6	30	6	28	9	28	3	28	3	33	6	27	3
1893.....	36	0	34	3	30	9	29	9	29	6	28	6	28	0	37	6	27	6
1894.....	34	6	31	9	31	0	29	2	28	3	28	9	29	0	36	0	27	7
1895.....	33	3	31	3	28	3	28	3	27	6	26	9	26	9	34	6	25	10
1896.....	33	6	30	6	28	9	28	0	27	6	27	9	29	0	37	0	27	4
1897.....	35	6	32	6	30	3	29	3	28	0	27	0	27	6	37	0	26	5

1904.....	36	3	34	5	30	9	29	5	29	5	30	4	29	3	37	4	28	1
1905.....	31	10	30	8	29	7	29	0	28	0	28	5	28	1	33	6	27	1
1906.....	32	4	31	5	29	3	27	11	27	3	27	4	27	6	33	3	26	9

6-7 EDWARD VII., A. 1907

On the opening of the season of navigation of 1907 the gauge at Sorel will be changed and an additional draught of nearly 4 feet given.

Compared with the lowest stage of water in 1906, the depth will be increased from 26 feet 10 inches to 30 feet 6 inches.

This cannot fail to be of very great importance to the commercial interests of the St. Lawrence, and it is understood that the navigation plans for next year promise a great increase in the size and tonnage of vessels to Montreal.

ACCIDENTS IN 1906.

As the season of 1905 was memorable on account of the number and seriousness of the accidents in the St. Lawrence, that of 1906 was a record one for safety and the exceedingly slight damage and loss.

In the Harbour of Montreal there were two collisions, at almost the same place, near the end of Victoria pier. As a result of the first one the ss. *Gaspésien*, a small coasting vessel, was grounded as a precaution.

Between Montreal and Quebec the season passed with a record of only three slight accidents.

The *Nyassa*, at Contrecoeur, on July 29, went on a soft mud bank, owing to the failure of the steering gear. After lightering a very small quantity of cargo, she was pulled off and proceeded without damage.

The *Monmouth* and *Agnar* crowded into the Cap Charles cut together, and the *Agnar* went on the bank, floating again in a few minutes, without damage.

The new 10,000-ton ss. *Athenia*, with a valuable cargo, ran into a snow storm at Cap à la Roche, on November 9, and went aground on the north bank. This is one of the worst places in the river, and great fears were entertained for her safety. Fortunately the C.G.S. *Lady Grey* arrived, and with her aid, assisted by dredge tugs, the steamship was floated with the rising tide, and proceeded without apparent damage.

The damage and cost of the floating of these vessels could not have amounted to the loss sustained on a railway by the smashing of a couple of freight cars, and yet the traffic in freight and passengers, on the route, amounted to what would be a very extensive amount of railway business.

Between Quebec and Father Point the coasting ss. *Campana* went ashore in a fog. The large coal ship *Mystic* grounded at Crane Island, and the coaster *Polino* went badly aground in a snow storm on Goose Island.

This is a splendid record for such a long stretch of river and extensive traffic.

Below the Pilotage District, in the St. Lawrence to the Gulf, the ss. *Bray head* was reported to have grounded while loading. The ss. *Cervona* was stranded for a few days on Anticosti, and the Dominion liner *Kensington* went aground near Matane, but after a trying experience in an autumn storm, she safely floated and proceeded to Montreal.

For the River and Gulf of St. Lawrence, from Montreal to Cape Ray, a distance of 700 nautical miles, the above statement of accidents for 1906 is, to say the least, exceedingly satisfactory.

GENERAL INFORMATION.

Although, with the exception of some minor shoals at Champlain, there is practically no filling in, and although since its commencement no actual boulders have been known to have been carried into the dredged channel, as such conditions are possible, it has been decided that once a year the dredged and shallow channels shall be swept.

This is a large problem. The work has to be done with very great care, and good weather conditions are required.

Mr. N. B. McLean, C.E., with an assistant, were specially detailed for this important work. A twin-screw river steamer and a testing scow make up the present sweeping plant. When the channel was 300 feet wide and only 60 miles required sweeping, this plant was sufficient. The work below Batiscan, including Cap à la Roche, where the weather is bad and the current strong, was then left until mid-summer.

SESSIONAL PAPER No. 21

The Shipping Federation of Canada, the Pilots and Boards of Trade, have urged for more sweeping, both above and below Quebec, and a regular examination early each Spring, when the weather, strong current and depth of water make the present plant of no use.

The new-ice breaking and sweeping tug 'Lady Grey' has been carefully designed, with a view to this service.

Two semaphores, indicating the channel depths in their respective localities, were maintained as usual, the one at St. Jean des Chaillons for the depth in the Cap à la Roche dredged cut, and the other at St. Nicholas for the depth over the undredged St. Augustin Bar.

The Department has been engaged in studying a plan for signal stations between Montreal and Quebec, for the safety and regulation of traffic, more on the lines of a canal or railway organization.

Experience has shown how imperative it is for vessels, especially the large ones, navigating the St. Lawrence between Montreal and Quebec, to have knowledge of the conditions in the narrow reaches of the channel ahead. Fog, thick mist, or smoke from bush fires, frequently settle down very suddenly and render it very unsafe to proceed.

To cite a particular instance, it is claimed that if the semaphore operator at Cap à la Roche could have reported fog, the R.M.S. 'Victorian' would have anchored at Batiscan on September 1, 1905, where the weather was perfectly clear at the time, and thus prevented the accident at Cap Charles.

The valuable features of the service would therefore be the reporting of weather conditions along the route, depth of water in the tidal sections of the River, positions of vessels and, especially, casualties or obstructions in the Ship Channel. The value of the Government long distance service would be very great, particularly with regard to dredging operations, buoy service and general Government business.

It is hoped that early in 1907 a system of stations, connected by a private copper telephone wire operated by the Bell Telephone Company, will be completed.

From the latest information the number of sea-going vessels reaching Montreal, in 1906, was 820, and the total ocean-going tonnage for the season reached 1,977,534 tons, an increase of 2 per cent.

DIVISIONS.

Ship Channel between Montreal and Quebec.

Division I., Montreal to Sorel.

The Eastern limit of the Harbour of Montreal is Longue Pointe. An extensive shoal of clay, boulders and hard pan, exists opposite Longueuil. Although the dredging of the Ship Channel at this place was not included in the project of 1899, it was necessary, before the 30-foot channel would be available to Montreal, and could not be delayed.

The Montreal Harbour Commissioners had not suitable plant, so at the urgent request of the Shipping Federation of Canada the Department undertook this work which, owing to its situation at the foot of the St. Mary's current and the hard nature of the material, was an addition of considerable importance to the project.

The work was commenced in August, 1905, and all completed by two dredges and a stone-lifter, in August, 1906.

This completes the 30-foot channel in this Division which, in a distance of 45 miles, required 22.9 miles of dredging.

With the exception of the range lights in Montreal Harbour, and two nearly completed near Sorel, the improvements in this Division are all completed.

Division II., Sorel to Batiscan.

Although there is a tide between Three Rivers and Batiscan, it is not available for navigation, being too uncertain both as to height and time.

6-7 EDWARD VII., A. 1907

The dredging for the 30-foot channel is practically completed. A few days' work at the head of Lake St. Peter and a similar amount at Batture Péron, widening the natural channel, will finish the improvements.

The permanent range lights are also all either completed or well under way.

In this Division, in a distance of 35 miles, the length requiring dredging was 12.45 miles.

Division III., Lake St. Peter.

The St. Lawrence at Lake St. Peter widens out into a shallow water lake, about 9 miles wide and 22 miles long. The material is almost all soft blue clay of the consistency of ordinary table butter. A bank made almost vertical will remain for years. There is practically no filling in, but the wash of the propellers deepens the centre of the channel slightly and deposits it near the South bank.

At the close of navigation, 1906, the deepening to 30 feet at low water was completed. All of the three important curves have been widened to from 600 to 650 feet.

The length requiring dredging was 18 miles. This work is being left entirely to the hydraulic dredge 'J. Israel Tarte.' All of the deepening being now completed, this dredge will undertake next year widening and the construction of an anchorage in the middle of the Lake.

The permanent piers built by the lighthouse branch, are also completed and are giving very great satisfaction.

The deepening of the present channel was continued, leaving the widening, at the request of the navigation interests and the pilots, it being well known that in these long straight reaches, with very little current, navigation with the largest ships is quite safe, if the depth is available.

Division IV., Batiscan to Quebec.

From Batiscan to Quebec, a distance of about 60 miles, improvements require to be made over a length of about 10 miles, 2.90 miles of which is already completed to the 30-foot depth.

In this Division there are about 4 miles of work to be done, at Cap à la Roche and Cap Charles, mostly in solid shale rock.

This is one of the most important and difficult sections of the ship channel. The channel plant is particularly well adapted for this work, the only question being the fact that even with the six elevator dredges the work will not be completed, as was expected, before the arrival of the 15,000 ton ships.

In consideration of the fairly soft character of the shale rock, of the strong current, and of the fact that the work must be carried on without interrupting navigation, the elevator dredge is by far the most economical and efficient machine known. A powerful spoon dredge may tear up a certain quantity of soft rock more quickly, without stopping to make a clean, even bottom, chisel cutters and blasting plants may break up harder material, but taking everything into consideration the type of plant in the possession of the Department is particularly well designed for good, clean work, without interrupting navigation.

The shipping interests are urging for the early completion of this work, and another dredge is being constructed especially to rush the widening of the shale banks.

The distance between Batiscan and Quebec is about 60 miles. Tidal navigation is available throughout the whole distance.

At Cap à la Roche a semaphore, which is visible from Batiscan to Grondines, shows the depth in the channel opposite that place. Vessels of deep draught either anchor and wait for the tide, or time their trip so as to pass at or near high water.

The channel at Barre à Boulard, in the Richelieu rapids, and at Cap Santé, is completed to 30 feet at low tide, so that practically the only delay is two hours out of twelve at St. Nicholas, and for half tide at Cap à la Roche.

The dredging at Cap à la Roche stopped in 1893; it was recommenced in July, 1906. The material is shale of about the hardness of a soft school slate. There is no great difficulty in dredging it, the real difficulties to contend with being the holding of the dredges, the strong current and the heavy sea, during an easterly gale.

SESSIONAL PAPER No. 21

Dredge No. 5 (*Lafontaine*), commenced in July and stopped in November. In 113 days this dredge removed 159,000 cubic yards of shale from a depth of from 31 to 40 feet.

The improvements for the 30-foot channel have been designed with all possible care, so as to make a safe and easily navigable channel and at the same time be easily marked, and to offer a minimum of trouble to navigation during construction.

Instead of two curves, one curve of 3 miles radius has been laid out, in short tangents to be easily marked by buoys, and having a width varying from 500 to 550 feet.

In 1907, with four elevator dredges at work and one spoon dredge, if completed in time, it is expected that very closely to one million yards of this rock will be excavated.

SHIP CHANNEL BELOW QUEBEC.

Division V, Quebec to The Traverse.

The Parliamentary appropriation, to enable the commencement of the work of improving the channel below Quebec, became available late in the autumn of 1905.

It was decided to construct at the Government Shipyard, Sorel, a powerful steel, twin-screw, hopper, hydraulic dredge, at an estimated cost of \$350,000.

The Director of the Shipyard at Sorel estimated that it would take a year and a half to build and equip this very large and powerful machine, which was carefully designed for that special work.

The hull of the dredge, over 250 feet long, was successfully launched on December 1, 1906, and it is hoped the vessel will be ready to commence work on the St. Thomas shoals early in the season of 1907.

In March, 1906, the Department received very strong representations that these improvements could not be delayed, and that to wait till 1907 to make a commencement would seriously menace the proposed plans for a largely improved steamship service.

The nature of the work below Quebec, the exposed position, want of shelter, and high tides and changing currents, made the ordinary American type of dredge out of the question.

The self-propelling, sea-going, hopper type, as almost altogether used in Great Britain, being required, inquiries were made from the dredge builders in Great Britain and ship agents, for a dredge immediately available, suitable for this work.

The builders had none on hand and the only suitable ones offered were in Australia and South Africa. Messrs. Ferguson Brothers, one of the largest firms building dredging and harbour plant, wrote stating that there was not a hopper dredger of the capacity mentioned to be bought in England. Messrs. Wm. Simons & Company, also large and successful dredge builders, wrote that all their large dredges were fully employed, and that they did not know of any to be disposed of for some considerable time, and that they did not think there was a possibility at that time of procuring a second-hand hopper dredger, either of the hydraulic or bucket ladder type.

A Dutch pump dredge, at New Orleans, was offered by Messrs. H. E. Moss & Company, of Liverpool, England, for £34,000.

The price being very reasonable, on authority of Council, the Minister ordered an examination with a view to purchase. The only objection to this dredge was that it had no cutter, and therefore not suitable for dredging anything but sand or soft silt.

A visit was made to Galveston Harbour, where three smaller dredges of the same design and type were working. The results of the working of these dredges were very satisfactory, and it was certain that this dredge would be very valuable for many places in Canada, and was very cheap at the price.

By cable the offer of Messrs. Moss & Co. was reduced to £30,000, and the dredge was purchased on April 20, at that price, or \$146,000, with interest to date of payment.

The vessel was docked and made ready for the long voyage, and all expenses of repairs, wages, provisions, stores, &c., until the dredge reached Quebec, amounted to \$10,942.14 and \$4,574.17 insurance.

SESSIONAL PAPER No. 21

The general dimensions and particulars of the *Galveston*, a steel, twin-screw, suction, hopper dredge, are as follows:—

Length, 233 feet; breadth, 39 feet; depth, 15 feet 5 inches.

Draught when laden with 1,800 tons, 14 feet 9 inches aft, 13 feet 1 inch forward.

Dredges to 55 feet and raises 1,350 cubic yards in 45 minutes.

Hopper capacity about 1,400 cubic yards.

Built in 1904.

Engines, 2 triple expansion, about 600 I.H.P. each

Cylinders, 15½ inch., 24 in. and 37½ in. diameter. Stroke, 17½ in.

Two boilers. Two suction pumps, Dutch type, 8 feet 6 inches outside dia.

Speed, loaded, 9 miles.

Electric light. Ample crew accommodation.

Arranged for pumping dredged material ashore at a distance of 1,500 to 1,600 feet.

The *Galveston* reached Quebec on July 1, having been 29 days on the voyage from New Orleans, under her own steam.

Repairs and fitting out and the organization of a crew were immediately proceeded with, and the dredge commenced work on August 11.

The usual difficulties were encountered in training the crew, overcoming the difficulties in holding the vessel in the changing currents, and in holding the fine sand in the hoppers.

The dredge, however, much more than fulfilled the expectations, and realized a substantial improvement to the amount of nearly 100,000 cubic yards, before the close of the season of 1906.

The dredge was caught in the very severe gale of October 7 and, for a time, ran a great risk of being wrecked. The ten-ton suction pipe and derrick broke loose from lashings and had to be let go to save the ship. The pipe was recovered in a couple of days, but the derrick could not be found and lifted for some time, owing to a succession of gales. Everything was, however, recovered and put in order again, and the dredge finished the season on November 9.

The *Galveston* was then sent to St. John, N.B., to remove the silt which had filled up the Intercolonial Railway berths.

SESSIONAL PAPER No. 21

COST OF SHIP CHANNEL TO DATE.

TABLE showing the Total Cost of the Dredging and Plant, and the Quantities dredged to June 30, 1906.

	Cost of Dredging.	Expenditure for Plant, Shops, Surveys, &c.	Quantities Dredged.
	\$ cts.	\$ cts.	Cubic yards.
<i>Montreal Harbour Commissioners, 1851 to 1888.</i>			
Dredging Montreal to Cap à la Roche to 27½ feet at ordinary low water, and from Cap à la Roche to Quebec to 27½ feet at half tide.	3,402,494 35	534,809 65	19,865,693

DREDGES.

Laval (No. 1.)—Of the fleet ship channel dredges, this is the oldest. The hull is of wood, constructed in Ottawa in 1894. The buckets are made of cast steel for work in rock and other hard material. The details of the operations of this dredge for the fiscal year were as follows:—

From the commencement of the fiscal year until July 15, 1905, the *Laval* worked at widening and deepening the channel at Becancour traverse, the material consisting of hard clay and stones. She was then laid out to straighten, widen, and deepen, the channel at Cap Madeleine, where she continued to work until August 7, the material being also hard clay and stones. The dredge was then taken up to work at Longueuil to widen and deepen the channel in Montreal harbour, where the material was exceedingly hard and tough, consisting of hardpan, clay, stones, and some shale rock. She continued to work there until taken into winter quarters, on November 25. During the winter this dredge was put in good order for the next season's work.

On the opening of the season of 1906, the *Laval* was taken back to work at Longueuil, on April 23, where she continued until the end of the fiscal year.

In a total of 185 days during which this dredge was at work, her machinery was in actual operation 62 per cent of the full working time.

The total quantity dredged amounted to 144,000 cubic yards, all very hard material, at a cost of \$50,828.47, or 35.29 cents per cubic yard.

Laurier (No. 2).—The hull of this dredge is also of wood, having been constructed at the Government Works at Sorel in 1897. Her buckets were formerly of large size, built up from cast steel bottoms, for working in soft material. As almost all the work in soft material was completed, the buckets were changed during the winter of 1903-4, and replaced by smaller and stronger buckets, having sufficient teeth for working in hardpan, &c.

During the winter of 1904-5 this dredge was thoroughly overhauled and had the above water parts of the hull rebuilt. Additional quarters were also provided for the crew.

From the commencement of the fiscal year until October 17, 1905, the *Laurier* worked at widening and deepening the channel between Pointe Citrouille and Champlain, the material being clay, sand, and a few stones. When the material found became too hard for the dredge, she was then taken up to work on the channel between Sorel and Ile de Grace where she worked until taken into winter quarters, on November 28, the material being soft clay.

This dredge, with three others, was used for a short period during the month of September in holding and floating the Allan Line R.M.S. *Victorian*, which was aground at Cap Charles, where there was danger of swinging around and blocking the channel.

The *Laurier* was laid out to commence the season's work on April 25, 1906, on the channel between Sorel and Ile de Grace, and continued working there until May 19, when she was taken down to work on Batture Perron, Batiscan, to widen, deepen, and straighten the channel, where she was still at work at the end of the fiscal year; the dredged material being clay, sand, and some stones.

The number of days during which this dredge was in operation was 185, and the percentage of time at actual work, 63.

During the fiscal year she removed 408,350 cubic yards at a total cost of \$49,255.65, or 12.06 cents per cubic yard.

Lady Aberdeen (No. 3).—The hull of this dredge is of steel, the vessel complete, having been constructed at the Sorel works in 1900. The buckets were originally designed for working in soft material, but were replaced by a complete new set of cast steel buckets, especially designed for working in rock or other hard material.

At the commencement of the fiscal year this dredge was working at Champlain curve, widening and deepening and remained there until August 11, 1905, when she left to replace dredge *Lafontaine* on Becancour traverse, which having broken down had to be taken to Sorel for repairs.

The material was exceedingly tough and difficult to dredge, consisting of hardpan and embedded boulders.

After the *Lady Aberdeen* had finished her cut on Becancour traverse, she was laid out at Cap Madeleine on September 14, where Dredge *Laval* had left off, to go to Longueuil.

The work was finished at Cap Madeleine on September 22, and the dredge was taken down to Champlain curve to replace Dredge *Lafontaine*, removed to work at Longueuil. The *Lady Aberdeen* continued to work on Champlain curve till she was taken to Sorel for the winter on November 24, 1905.

This dredge was also used with three others for a short period during the month of September in connection with the floating of the R.M.S. *Victorian*.

On the opening of the season of 1906, the *Lady Aberdeen* was taken back to work on Champlain curve on April 28, the material consisting of hard clay, stones, and some sand. She was still working there at the end of the fiscal year.

The working time of the *Lady Aberdeen* was 180 days, the dredge being in actual operation 70 per cent of the full working time.

The total number of cubic yards removed amounted to 270,700, at a total cost of \$46,886.99 or 17.32 cents per cubic yard.

Lady Minto (No. 4).—Dredge No. 4 is of the same type and design as the *Lady Aberdeen*. During the winter of 1903-4, the buckets were replaced by a complete new set of cast steel buckets for working in rock and hard material.

SESSIONAL PAPER No. 21

At the commencement of the fiscal year, this dredge was working at Becancour curve, the material being very hard, consisting of hard clay and stones. On finishing her cut there she was laid out to work at Cap Madeleine on July 11, 1905, to widen and deepen the channel, the material being, also, hard clay and stones. When the dredge had finished there on October 4, she was taken to clean up some lumps found by testing at Becancour channel, and traverse, and at Cap Madeleine. When the dredge had finished cleaning up the lumps she was taken down to Champlain on October 17, to replace Dredge *Laurier*, as the material was too hard for that dredge.

The *Lady Minto* continued to work on the channel between Champlain and Pointe Citrouille until November 16. She was then taken to work on the channel between Sorel and Ile de Grace, and worked there until November 28, 1905, when she was taken into Sorel for the winter.

This dredge was also used for a short period during the month of September in connection with the floating of R.M.S. *Victorian*, aground at Cap Charles.

During the winter the dredge was overhauled and put in good order for next season's work.

On April 26, 1906, she left Sorel, and was laid out to work on the channel between Sorel and Ile de Grace, where she worked until May 24, when it was decided to take the dredge to Montreal and put her into dry dock, as she was leaking badly. The vessel was in Tate's dry dock until May 30, and the hull was well repaired. The dredge was then taken down to Horseback shoal, Grondines, to straighten a caved-in bank, on the south side of the channel, the material being gravel, stones and boulders. This work required the use of a stone lifter most of the time. After finishing at Grondines, the dredge was taken to Batiscan and was laid out on June 5, on Batture Perron, to straighten, widen, and deepen the channel there, the material consisting of clay, sand, and stones. The dredge finished her cut on June 20, and was then taken down to Bastiscan traverse, and put to work to widen and deepen the channel there, the dredged material being clay with some large stones. At the end of the fiscal year this dredge was still working on Batiscan traverse.

The number of days during which this dredge was in operation was 184, and the percentage of time of actual work, 66.

During the fiscal year 278,650 cubic yards were dredged, at a total cost of \$50,739.82 or 18.20 cents per cubic yard.

Lafontaine (No. 5).—The hull of this dredge is of wood, the work of the Sorel ship-yard, completed in 1901. She was fitted out with large, but very strong built up buckets for fairly soft material, but during the winter of 1904-5, these were replaced by a complete new set of cast steel buckets for working in rock and other hard material.

From the commencement of the fiscal year until August 2, 1905, the *Lafontaine* worked on Becancour traverse, where the material was exceedingly tough and difficult to dredge, consisting of hard-pan and embedded boulders. The dredge having broken one of her large spur wheels, she was taken to Sorel for repairs. After being repaired, she was taken down to replace dredge *Baldwin* on Champlain curve, on August 10, the *Baldwin* being taken to work on the Channel at Longueuil.

She worked at Champlain until September 22, when she was taken up to work at Longueuil to replace the *Baldwin*, as the material was too hard for that dredge, being very hard clay, stones, and some shale rock. The *Lafontaine* worked there widening, deepening, and straightening the channel until November 24, 1905, when she was taken to Sorel for the winter.

This dredge was one of the four used for a short period during the month of September, in connection with floating the Allan R.M.S. *Victorian* aground at Cap Charles.

During the winter the dredge was overhauled, and a complete new set of bucket teeth put on.

6-7 EDWARD VII., A. 1907

On the opening of the season of 1906 this dredge commenced operations at Longueuil shoal, on April 24 the material being very difficult to dredge, composed of hardpan, and some stones. At the end of the fiscal year, the *Lafontaine* was still working at Longueuil.

The working time of the *Lafontaine* was 185 days, the dredge being in actual operation 71 per cent of the full working time.

The total number of cubic yards removed amounted to 213,600, at a total cost of \$55,736.39, or 26.09 cents per cubic yard.

Baldwin (No. 6.)—This is the newest vessel of the elevator dredge fleet. The hull is of wood constructed at the Sorel Shipyard in 1902.

During the winter of 1903-4, the buckets were rebuilt and strengthened, and during the winter of 1904-5, sufficient teeth were added to the buckets for working in hardpan, &c.

At the commencement of the fiscal year the *Baldwin* was working on Champlain curve, and continued working there until August 10, 1905, when the dredge was taken to Longueuil shoal to work at widening, straightening, and deepening the channel in Montreal harbour. On the way up, the dredge stopped at Sorel for a couple of days to have some new teeth put in, and other repairs done before being put to work at Longueuil, where the dredging material was very hard.

This dredge was laid out on August 14 on the north side of the channel. She worked there until September 25, when she was replaced by dredge *Lafontaine*, owing to the material being too hard. The *Baldwin* was taken down and laid out to work on the channel between Sorel and Ile de Grace, the material being soft clay, and continued to work there until taken into winter quarters, on November 28, 1905.

On April 24, 1906, the *Baldwin* was taken back to work on the channel between Sorel and Ile de Grace, and at the end of the fiscal year, was still working there.

The number of days during which this dredge was in operation was 186, and the percentage of time at actual work 74.

The total number of cubic yards removed amounted to 747,720, at a cost of \$55,640.95, or 7 $\frac{4}{100}$ cents per cubic yard, an exceedingly good record.

J. Israel Tarte (No. 7.)—This hydraulic dredge is one of the newest vessels of the ship channel dredging fleet, and a new departure as regards plant for the improvement of navigation in Canada. She was constructed in 1902, by the Polson Iron Works Company, of Toronto, Canada.

The hull is of steel, of the same type and general design as the steel hulls of the elevator dredges.

At the commencement of the fiscal year this dredge was working at the foot of Lake St. Peter, at No. 3 Curve, and after finishing the curve, the dredge continued to work on the channel between No. 3 Curve and the White Buoy Curve, deepening and widening, the material being soft blue clay. She was taken into winter quarters on November 16, 1905.

During the month of July the dredge lost several days on account of the cutter head breaking off, to recover which, the use of a stone lifter was required.

Delay was caused during the month of August on account of the dredge working opposite the new pier which was being built for the lighthouse at No. 3 Curve, owing to the great care that had to be taken to prevent the pontoons being damaged against the pier.

During September the cutter shaft broke, and had to be replaced.

The boilers, owing to the very heavy duty required, also gave trouble by leakages, which necessitated a good deal of repair work.

In October and November long delays were caused and time lost through wind, breakages and steamships.

During the winter a great deal of repair work was done to the boilers to put them in good order for the next season's work. The dredge generally was given a good overhauling.

SESSIONAL PAPER No. 21

On April 30, 1906, the dredge was laid out to work where she left off on November 16, 1905, on the channel between No. 3 Curve and White Buoy Curve, but as it was decided not to do any more widening until the whole channel in Lake St. Peter was deepened to 30 feet, and the work of deepening the old channel to the width of 300 feet was hurried with all possible vigour.

During the month of May, delays were caused through winds and ordinary break-ages, but during June the boilers began to leak badly, and after being inspected by the boiler inspector, Mr. Samson, orders were given on June 20 to take the dredge to Sorel to have them repaired.

At the end of the fiscal year the dredge was still at Sorel undergoing repairs.

In the 160 days, the dredge was in actual operation 56 per cent of the full working time.

The total number of cubic yards removed amounted to 1,984,510, at a cost of \$117,668.03, or an average of 5 $\frac{9}{100}$ cents per cubic yard.

The total number of cubic yards removed by the dredging fleet during the fiscal year ending June 30, 1906, amounted to 4,047,530, at a cost of \$426,756.30, or an average of 10 $\frac{5}{100}$ cents per cubic yard.

GENERAL NOTES.

The announcement of the completion of an available channel for navigation between Quebec and Montreal of 30 feet at extreme low water an increase of nearly 4 feet, is of very great importance to the trade of Canada.

The dredging was completed late in November, and all swept, and at the opening of navigation in 1907 the Sorel gauge will be corrected, giving an extra 3 feet 10 $\frac{1}{2}$ inches.

Although every part of the channel in doubt has been carefully tested, it is the intention, as soon as possible after the ice leaves the river next spring, that the sweeping tug *Lady Grey* will start from Montreal, and run three lines of sweeping to the full depth as indicated by the Sorel gauge and the semaphores, to assure that nothing has been left to be of the slightest obstacle to the full depth indicated.

The success is not attended without difficulty and anxiety. The dredges are operated 132 hours per week, or steadily from midnight on Sunday until noon on Saturday. Stops are only made for repairs, for shifting from one place to another, bad weather, or to give room for passing vessels. Coal is supplied by barges without stopping the work.

The constant steady work in exceedingly hard material, at a depth of from 32 to 42 feet, is very hard on machinery. Only the very best designed and well constructed plant can stand it. Traffic must not be interrupted, and the work must always be carried on in the more or less swift current.

The material is increasing in hardness from year to year, as the work nears Quebec. All the soft material, except the remainder of the work in Lake St. Peter, is now completed. A dredge that can remove 6,000 yards per day in soft material, without trouble, is more fatigued by dredging 1,000 yards of hard-pan, in which boulders are imbedded.

The best and most efficient plant is an absolute necessity.

All the superintendence and management devolves on the officers of the department.

The construction and repairs and the management of the Sorel works are in charge of Mr. G. J. Desbarats, C.E., Director of the Shipyard at Sorel.

The design of the improvements, the engineering branch, as well as the superintendence of the operations are directly under the Superintending Engineer.

The work of the very efficient staff and the details of the placing of the dredges are conducted by Mr. V. W. Forneret, C.E., in a very able manner.

About 400 men are employed in connection with the dredging operations. These men, all sailors, were born and brought up at Sorel or at some of the parishes bordering on the River St. Lawrence. Most of them have been trained to the service from boy-

6-7 EDWARD VII., A. 1907

hood. The senior captain of the fleet makes the statement that he has never earned a cent in any other service. A great deal of the success of the operations is due to this good training. The work requires extraordinary care and great patience, the machinery being forced to the utmost, and passing vessels requiring to be constantly watched for.

A captain and an engineer are in general charge respectively of the vessel and machinery. The remainder of the crew is divided into two watches, and works in shifts of 6 hours. At noon on Saturday the work stops.

Only two holidays, Dominion Day and Labour Day, are given throughout the season. The boarding of the men is done by contract with the captain of the vessel, at so much per man.

In making up the cost of the work of dredging, everything is included, except interest on the capital expenditure and depreciation. The principal items of cost are wages, fuel, board, stores and repairs, as well as general expenses and superintendence. The item of repairs includes keeping the plant in constant good order, but not new improved machinery. The cost of operating an elevator dredge, with its attendant plant, amounts to about \$45,000 per annum. The cost of operating the hydraulic dredge amounts to about double that sum.

It takes ten years to give an increase of depth of four feet. In much less than that time the maximum size of the ships using the channel has increased from 6,000 to 12,000 tons. Now 15,000-ton vessels are proposed.

That the channel of to-day will accommodate the commerce of ten years hence is not to be expected by even the most unimaginative, and it is recognized that we must build for the future. The capacity of the River St. Lawrence for navigation should grow with the country, as even now, to a large extent, the size of the vessel decides the economy of transportation.

TABLES.

The following tables show in a concise form the progress to date, the details of the operations of the different dredges, the classification of the expenditure, the cost per yard in each locality and the expenditure at Sorel in connection with new plant and the Shipyard generally:—

PROGRESS of the Dredging Operations at the date of Writing the close of the Season of 1906.

SESSIONAL PAPER No. 21

DREDGING PLANT.

The following is a description of the dredging plant in November, 1906, owned and operated by the Department of Marine and Fisheries in connection with the River St. Lawrence Ship Channel.—

DREDGES.

The Elevator Dredge 'Laval' (No. 1) wooden hull.

Length over all, 150 feet.
 Breadth of beam, 30 feet.
 Depth of hold, 14 feet.
 Average draught, 11 feet.
 Greatest working depth, 43·5 feet.
 Hull built in Ottawa in 1894.
 Steel buckets.
 Working capacity per day in hard material, 1,000 to 2,000 cubic yards.

The Elevator Dredge 'Laurier' (No. 2), wooden hull.

Length over all, 168 feet.
 Breadth of beam, 32 feet.
 Depth of hold, 14 feet.
 Average draught, 10 feet.
 Greatest working depth, 42·5 feet.
 Built at Sorel shipyard in 1897.
 $\frac{3}{4}$ cubic yard buckets for hard-pan.
 Working capacity per day in fairly stiff clay, 2,000 to 3,000 cubic yards.

The Elevator Dredge 'Lady Aberdeen' (No. 3), steel hull.

Length over all, 148 feet.
 Breadth of beam, 32 feet.
 Depth of hold, 13 feet.
 Average draught, 8·5 feet.
 Greatest working depth, 42·5 feet.
 Built at Sorel shipyard in 1900.
 Steel buckets.
 Working capacity per day in hard material, 1,000 to 2,000 cubic yards.

The Elevator Dredge 'Lady Minto' (No. 4), steel hull.

Length over all, 148 feet.
 Breadth of beam, 32 feet.
 Depth of hold, 13 feet.
 Average draught, 8·5 feet.
 Greatest working depth, 42·5 feet.
 Built at Sorel shipyard in 1900.
 Steel buckets.
 Working capacity per day in hard material, 1,000 to 2,000 cubic yards.

The Elevator Dredge 'Lafontaine' (No. 5), wooden hull.

Length over all, 168 feet.
 Breadth of beam, 32 feet.
 Depth of hold, 14 feet.

Average draught, 9 feet.
 Greatest working depth, 45 feet.
 Built at Sorel shipyard in 1901.
 Steel buckets.
 Working capacity per day in hard material, 1,000 to 2,000 cubic yards.

The Elevator Dredge 'Baldwin' (No. 6), wooden hull.

Length over all, 165 feet.
 Breadth of beam, 34 feet.
 Depth of hold, 14 feet.
 Average draught, 8 feet.
 Greatest working depth, 45 feet.
 Built at Sorel shipyard in 1902.
 1 cubic yard buckets strengthened for fairly hard material.
 Working capacity per day in medium material, 2,500 to 3,500 cubic yards.

The Hydraulic Dredge 'J. Israel Tarte' (No. 7), steel hull.

Length over all, 160 feet.
 Breadth of beam, 42 feet.
 Depth of hold, 12.5 feet.
 Average draught, 6 feet.
 Length of suction frame, 50 feet.
 Greatest working depth, 50 feet.
 Built at the Polson Iron Works, Toronto, in 1902.
 Working capacity per day in soft material, 12,000 to 20,000 cubic yards.

Discharge Pipe and pontoons of Dredge 'J. Israel Tarte' (No. 7).

23 lengths of pipe, 36 ins. diameter by 100 feet long.
 1 length of pipe, 36 ins. diameter by 35 feet long.
 23 pairs of pontoons for floating pipes, 42 ins. diameter by 90 feet long.

Winch Scow 'No. 3' for Dredge 'J. Israel Tarte' (wooden hull).

Length over all, 60 feet.
 Breadth of beam, 18 feet.
 Depth of hold, 6 feet.
 Built at Sorel shipyard in 1902.

Winch Scow (wooden hull) for Dredge 'J. Israel Tarte' (with steam boiler and steam winch).

Length over all, 75 feet.
 Breadth of beam, 25 feet.
 Depth of beam 5.5 feet.
 Built at Sorel shipyard in 1902.

The Suction, Hopper Dredge 'Galveston' (steel hull, twin screw).

Length over all, 233 feet.
 Breadth of beam, 39 feet.
 Depth of hold, 15 feet 5 in.
 Draught when loaded with 1,800 tons, 14 ft. 9 in. aft., 31 ft. 1 in forward.
 Greatest working depth, 55 feet.
 Two suction pumps of Dutch type, 8 ft. 6 in. outside diameter.

SESSIONAL PAPER No. 21

Built in 1904.

Working capacity, 1,350 cubic yards in 45 minutes.

Hopper capacity, 1,400 cubic yards.

TUGS.

The Ice-breaking and Sweeping Tug 'Lady Grey' (steel hull, twin screw).

Length between perpendiculars, 172 feet.

Length over all, 183 feet 6 inches.

Breadth moulded, 32 feet.

Breadth extreme, 32 feet 3 inches.

Depth moulded, 18 feet.

Draft mean to bottom of flat plate keel (normal), 12 feet.

Draft mean, when ice-breaking, about 13 feet.

Displacement in tons at 12 ft. draft, 1,070.

Mean speed at 12 ft. draft on 6 runs over measured mile base, 14 knots.

Built by Vickers, Sons & Maxim, Ltd., Barrow-in-Furness, in 1906.

The Tug 'Frontenac' (composite hull).

Length over all, 113 feet.

Breadth of beam, 23 feet.

Depth of hold, 10 feet.

Average draught, 9 feet.

Built at Sorel shipyard in 1901.

The Tug 'Eureka' (steel hull).

Length over all, 100 feet.

Breadth of beam, 22 feet.

Depth of hold, 12 feet.

Average draught, 11 feet.

Built in Glasgow, Scotland, in 1893.

The Tug 'James Howden' (wooden hull).

Length over all, 100 feet.

Breadth of beam, 21 feet.

Depth of hold, 10 feet.

Average draught, 7.5 feet.

Built at Sorel shipyard in 1903.

The Tug 'St. Jean-Iberville' (steel hull).

Length over all, 90 feet.

Breadth of beam, 18 feet.

Depth of hold, 12 feet.

Average draught, 10 feet.

Built at Sorel shipyard in 1897.

The Tug 'Lac St. Pierre' (wooden hull).

Length over all, 100 feet.

Breadth of beam, 21 feet.

Depth of hold, 10 feet.

Average draught, 7.6 feet.

Built at Sorel shipyard in 1901.

The Tug 'St. Francis' (wooden hull).

Length over all, 80 feet.
 Breadth of beam, 17 feet.
 Depth of hold, 10·8 feet.
 Average draught, 9 feet.
 Built in 1875.

The Tug 'Cartier' (wooden hull).

Length over all, 84 feet.
 Breadth of beam, 18 feet.
 Depth of hold, 9·5 feet.
 Average draught, 8 feet.
 Built at Sorel shipyard in 1893.

The Tug 'Emilia' (wooden hull).

Length over all, 84 feet.
 Breadth of beam, 17 feet.
 Depth of hold, 9 feet.
 Average draught, 7·5 feet.
 Built at Sorel shipyard in 1898.

The Tug 'Champlain' (wooden hull).

Length over all, 84 feet.
 Breadth of beam, 17 feet.
 Depth of hold, 9 feet.
 Average draught, 7·5 feet.
 Built at Sorel shipyard in 1901.

The Tug 'Jesse Hume' (wooden hull).

Length over all, 72 feet.
 Breadth of beam, 17·3 feet.
 Depth of hold, 10 feet.
 Average draught, 8·5 feet.
 Built in Buffalo in 1878.

The Tug 'Montcalm' (wooden hull).

Length over all, 80 feet.
 Breadth of beam, 23 feet.
 Depth of hold, 8 feet.
 Average draught, 6·5 feet.
 Built at Sorel shipyard in 1903.

The Tug 'Carmelia' (wooden hull).

Length over all, 84 feet.
 Breadth of beam, 17 feet.
 Depth of hold, 9 feet.
 Average draught, 7·5 feet.
 Purchased in 1903.

COAL BARGES.

The Coal Barge 'No. 1' (wooden hull).

Length over all, 120 feet.
 Breadth of beam, 24 feet.
 Depth of hold, 10 feet.
 Built at Sorel shipyard in 1898.

The Coal Barge 'No. 2' (wooden hull).

Length over all, 125 feet.
 Breadth of beam, 25 feet.
 Depth of hold, 11 feet.
 Built at Sorel shipyard in 1900.

The Coal Barge 'No. 3' (wooden hull).

Length over all, 98 feet.
 Breadth of beam, 28 feet.
 Depth of hold, 12 feet.
 Built at Sorel shipyard in 1902.

The Coal Barge 'No. 4' (wooden hull).

Length over all, 98 feet.
 Breadth of beam, 28 feet.
 Depth of hold, 12 feet.
 Built at Sorel shipyard in 1903.

Stone-lifter 'No. 2' (wooden hull).

Length over all, 80 feet.
 Breadth of beam, 25 feet.
 Depth of hold, 9·8 feet.
 Rebuilt at Sorel shipyard in 1897.

Stone-lifter 'No. 3' (wooden hull).

Length over all, 108 feet.
 Breadth of beam, 34 feet.
 Depth of hold, 14 feet.
 Built at Sorel shipyard in 1903.

Sounding Scow (wooden hull).

Length over all, 60 feet.
 Breadth of beam, 25 feet.
 Depth of hold, 6 feet.
 Built at Sorel shipyard in 1898.

Coal Scow 'No. 2' (wooden hull).

Length over all, 54 feet.
 Breadth of beam, 18 feet.
 Depth of hold, 4 feet.
 Built at Sorel shipyard in 1892.

Six Lodging Scows (wooden hulls).

Rebuilt from old dump scows and fitted out as lodging scows for crews of dredges and tugs of ship channel fleet. at Sorel shipyard in 1899, 1901, and 1902.

HOPPER SCOWS.

1 Hopper Scow (wooden hull) with hydraulic power for closing gates.

Length over all, 97 feet.
Breadth of beam, 24·5 feet.
Depth of hold, 9 feet.
Capacity, 200 cubic yards.
Built at Sorel shipyard in 1897.

2 Hopper Scows (wooden hulls) with hydraulic power for closing gates.

Length over all, 90 feet.
Breadth of beam, 18 feet.
Depth of hold, 7 feet.
Capacity, 150 cubic yards.
Built at Sorel shipyard in 1898.

4 Hopper Scows (wooden hulls) with hydraulic power for closing gates.

Length over all, 97 feet.
Breadth of beam, 24 feet.
Depth of hold, 9 feet.
Capacity, 200 cubic yards.
Built at Sorel shipyard in 1899 and 1901.

5 Hopper Scows (wooden hulls) with hydraulic power for closing gates.

Length over all, 98 feet.
Breadth of beam, 24 feet.
Depth of hold, 9·5 feet.
Capacity, 300 cubic yards.
Built at Sorel shipyard, 2 in 1901, 3 in 1902.

2 Hopper Scows (wooden hulls) with hydraulic power for closing gates.

Length over all, 97 feet.
Breadth of beam, 24·5 feet.
Depth of hold, 9 feet.
Capacity, 300 cubic yards.
Built at Sorel shipyard in 1903.

SESSIONAL PAPER No. 21

APPENDIX No. 13.

ANNUAL REPORT OF THE OFFICER COMMANDING MARINE
STEAMERS, &c., OF CANADA.

To the Deputy Minister of Marine and Fisheries,
Ottawa.

SIR,—I have the honour to submit a report on the several services under my superintendence. These services embrace the following branches at headquarters:—

Dominion Steamers,	Investigations into Wrecks,
Dominion Cruisers,	Fisheries Intelligence Bureau.
Pilotage,	

Separate report on investigations into wrecks forms an appendix hereto, and the reports on the work of Dominion cruisers, and Fisheries on Intelligence Bureau, will be found in the Fisheries report.

I have much pleasure in testifying to the good work done by captains and officers of the various vessels under my command during the past year.

The following vessels comprise the Dominion steamer fleet. These vessels are employed nearly exclusively in lighthouse and buoy work:—

<i>Lansdowne,</i>	<i>Gulnare,</i>	<i>Shamrock,</i>
<i>Aberdeen,</i>	<i>Minto,</i>	<i>Scout,</i>
<i>Druid,</i>	<i>Stanley,</i>	<i>Reserve,</i>
<i>Brant,</i>	<i>Maisonneuve,</i>	<i>Champlain,</i>
<i>Quadra,</i>	<i>Frontenac,</i>	<i>Montcalm,</i>
<i>Lady Laurier,</i>		

The steamers *Minto* and *Stanley* keep up communication between Prince Edward Island and the mainland during the winter.

The *Gulnare* is employed in the tidal survey work, and a synopsis by Doctor W. Bell Dawson of the work done by her will be found in the chief engineer's report.

The *Gulnare* was employed at survey work in the River St. Lawrence, under Mr. J. W. Stewart, during the season of 1905.

The *Maisonneuve* is principally employed in patrolling the channel between Kingston and Quebec for the purpose of ascertaining if the buoys, &c., are in position.

The *Bayfield* is employed, under Mr. J. W. Stewart, officer in charge of the hydrographic surveys, in Lake Superior. A full report of his work will be found elsewhere.

The *Frontenac* is a powerful tug, employed in the St. Lawrence ship channel, under the direction of Mr. Cowie.

The *Shamrock* is employed under Mr. U. P. Boucher, agent of the Department of Marine and Fisheries in Montreal, in the buoy service between Montreal and Quebec.

The *Scout* and *Reserve* are two vessels employed under the commissioner of lights in the lighthouse and buoy service between Montreal and Kingston.

The cruiser fleet consists of the following ships, and a report of the work done by each will be found in the Fisheries report:—

<i>Petrel,</i>	<i>Osprey,</i>	<i>Falcon,</i>
<i>Canada,</i>	<i>Curlew,</i>	<i>Kestrel,</i>
<i>Princess,</i>	<i>Constance,</i>	<i>Vigilant,</i>

The following are the dimensions, speed, armament, &c., of the different vessels controlled by this department:—

' MINTO.'

The *Minto* is an iron steamer 225 feet long, 32 ft. 6 in. beam, and 20 ft. 6 in. depth, with a gross tonnage of 1,099 tons, indicated horse power 2,900. She is com-

6-7 EDWARD VII., A. 1907

manded by Captain A. Finlayson, and, as before stated, she is principally employed in keeping winter navigation open between P. E. Island and the mainland, but during the past season she has been very actively employed in assisting in the erection of different Marconi stations in the Gulf and River St. Lawrence, and also in testing the capabilities of these stations in regard to the distance communication can be carried on. This vessel is fitted with the Marconi apparatus.

‘LANSDOWNE.’

The *Lansdowne* is a wooden steamer, commanded by Captain Bissett, employed in lighthouse and buoy work in the Bay of Fundy. She recently had new boilers fitted and she is now ready for a considerable period of further service. She is 188 feet long, 32 ft. wide, 15 ft. deep, with a gross tonnage of 680 tons.

‘GULNARE.’

This vessel is commanded by Captain T. Taylor, and is employed entirely on survey work. Her dimensions are as follows:—

Steel vessel 137 ft. long, 20 ft. 5 in. broad, and 13 ft. 6 in. depth; gross tonnage, 262 tons.

‘MAISONNEUVE.’

The *Maisonneuve* is a screw steamer 75 ft. 7 in. long, 9 ft. 7 in. broad, and depth of hold 7 ft. 3 in., with a gross tonnage of 26 tons.

‘ABERDEEN.’

This vessel is employed in lighthouse and buoy work in the Halifax agency. She is an iron screw steamer 180 ft. long, 31 ft. broad and 16 ft. deep, with a tonnage of 674 gross. She has been fitted with Thornycroft-Marshall water-tube boilers, and they have given every satisfaction.

‘PETREL.’

This vessel is a steel screw cruiser 116 ft. long, 22 ft. beam and 10 ft. 3 in. depth, with a gross tonnage of 192 tons. She has done most excellent work in Lake Erie, looking after United States fishermen, but for the last few seasons she has been found too slow to cope with the American steam tugs which are used for fishing purposes on the upper lakes. It was therefore decided to replace her with a very much larger and faster ship, and send the *Petrel* to the Atlantic coast where steam fishing vessels are not in use, and she will only have to cope with sailing schooners. She is commanded by Captain Kent.

‘STANLEY.’

The *Stanley* is an iron screw steamer 207 ft. long, 21 ft. beam, and depth of hold 19 ft., with a gross tonnage of 914 tons. She is commanded by Captain A. Brown. This vessel is principally used to keep communication up between P. E. Island and the mainland during the winter season, but like the *Minto*, this year she has been employed in erecting and testing the different Marconi stations placed by the government in the Gulf of St. Lawrence.—*Fitted with Marconi apparatus.*

‘OSPREY.’

This is a sailing schooner, employed in the Fisheries Protection Service on the Atlantic coast. She is 127 ft. long, and was built in Shelburne, Nova Scotia, and for some years was the fastest sailing schooner on the Atlantic coast. She is still very fast but there is no doubt that some of the United States fishing schooners are as good as she is now. She was commanded during the season by Acting Captain Graham.

SESSIONAL PAPER No. 21

' DRUID.'

The *Druid* is a lighthouse and buoy ship employed in the Quebec agency. She is a twin screw steamer 160 ft. long, breadth 30 ft., depth of hold 12 ft. 5 in., with a tonnage of 503 tons, and is fitted with triple expansion engines. She was built by Messrs. Fleming & Ferguson, Paisley, Scotland, in 1903, and is commanded by Captain Koenig.

' BRANT.'

The *Brant* is employed in the lighthouse and buoy service in Prince Edward Island. This is a wooden steamer 100 ft. long over all, 19 ft. broad and 8 ft. deep. This vessel is also employed in the fisheries protection service when necessity arises. She is commanded by Captain McKinnon.

' QUADRA.'

This vessel is employed in lighthouse and buoy service in British Columbia. She is an iron steamer 174 ft. long, 31 ft. beam, and a depth of 13 ft. 6 in., with a gross tonnage of 573 tons. She is commanded by Captain Hackett. This vessel, though doing good work on the Pacific, is not large enough or fast enough for the large number of extra aids to navigation which it is considered necessary to place on this coast, and I would recommend that a vessel more suitable for the work which has to be performed, should be built as soon as possible.

' PRINCESS.'

The steamer *Princess* was purchased during last season, and has taken the place of *La Canadienne*, and does exactly the same patrol work, under the command of Commander Wakeham. The *Princess* is a steel screw steamer, built in 1896 at Grangemouth, in England; she is 165 feet long, 26 ft. beam, and her depth of hold is 17.7 ft.; her gross tonnage is 542, and she was purchased from the Charlottetown Steam Navigation Company. *La Canadienne* was handed over to the hydrographic survey for survey work in the lower St. Lawrence.

' SHAMROCK.'

This vessel is employed in the buoy service between Montreal and Quebec. She is a steam barge 117 ft. long, 25 ft. beam, and 9 ft. 7 in. deep, with a gross tonnage of 237 tons. She is under the charge of Mr. U. P. Boucher, agent of the Department of Marine and Fisheries in Montreal.

' CURLEW.'

This is a twin screw iron steamer 116 ft. long, 19 ft. 8 in. wide, and 11 ft. 3 in. deep; gross tonnage, 158 tons. She is employed in fisheries work in the Bay of Fundy and western coasts of Nova Scotia, and is under the command of Acting Captain P. Robinson. She also assists in marine work when necessary.

' CONSTANCE.'

The *Constance* is a sister ship of the *Curlew* and is employed in revenue work in the River St. Lawrence and Atlantic coast. She is controlled entirely in regard to her movements by the Customs Department, but is managed in reference to expenditure, crew, &c., by this department. She is commanded by Captain May.

' LADY LAURIER.'

The *Lady Laurier* is a twin screw steel steamer, commanded by Captain Johnston. She is 214 ft. 9 in. long, 34 ft. 2 in. broad with a depth of 17 ft. 2 in., tonnage gross

6-7 EDWARD VII., A. 1907

1,051. She is employed in the lighthouse and buoy service on the Atlantic coast and is attached to the Nova Scotia Agency. She was built in 1902 to take the place of the late steamer *Newfield*. She is a very powerful and staunch steamer eminently fitted for the work she has to perform.—*Fitted with Marconi apparatus.*

‘SCOUT’ AND ‘RESERVE.’

Are two steamers used in connection with the buoy service between Montreal and Kingston. The *Reserve* is used for sweeping the river and is also used for towing scows employed for the purposes of placing buoys in position. The *Scout* is furnished with electric light and a powerful searchlight. Her dimensions are 103 ft. 6 in. long, 25 ft. 6 in. beam, depth 9 ft. 2 in., gross tonnage 175.

‘FALCON.’

The *Falcon* is a small steamer employed in the protection of the fisheries in British Columbia waters. She is 70 ft. 7 in. long, breadth, 17 ft. 8 in., depth, 7 ft. 4 in., with a gross tonnage of 71 tons. An account of her work will be found in Inspector Williams’ report, in the fisheries part of the departmental report.

‘KESTREL.’

The *Kestrel* is also employed in the protection of the fisheries in British Columbia waters. This vessel is 126 ft. long, 24 ft. beam, 12 ft. 2 in. depth, with a gross tonnage of 311 tons. She is a wooden vessel and commanded by Captain Newcomb. The conditions are so changed since this vessel was built, that she is now too slow, and it is recommended that a much faster and larger vessel be immediately built.

‘CANADA.’

In reference to the five new steamers, the *Canada* is a twin screw small third class cruiser with a speed of $21\frac{1}{4}$ miles an hour. She was built by Vickers, Sons & Maxim, at Barrow in Furness, England, is armed with four $1\frac{1}{2}$ pounder quick firing automatic mark 3, 1904 guns: two forward and two aft. Electrically lighted throughout and fitted with a very powerful searchlight. She arrived from England September, 1905, and has proved a very great success in the work for which she was designed to perform. It is the intention that this vessel should make a cruise of the West Indies during the winter. She carries a crew of 75 officers and men all told, and is fitted with the Marconi apparatus. Her dimensions are as follows:—200 ft. long, 25 ft. beam and 10 ft. 6 in. draft of water, with a gross tonnage of 850 tons. She is commanded by Captain Knowlton, and a number of the officers and crew have been through a course of instruction and received 1st class certificates in gunnery. This vessel is also armed in the way of small arms, with the new pattern Ross rifle, and the New Service D.A. Colt’s revolvers. It was intended that this vessel should form the nucleus of the proposed Canadian Naval Militia.

‘VIGILANT.’

The *Vigilant* is a steel twin screw, small 3rd class cruiser, built by the Polson Iron Works, Toronto. This vessel on her steam trial made a speed of $21\frac{1}{2}$ miles an hour. She is 175 ft. long, 22 ft. beam, and draws 10 ft. of water. She is electrically lighted throughout and fitted with a powerful searchlight. She carries the same guns and the same small arms as the *Canada*, and is used for the protection of the fisheries on the great lakes in place of the *Petrel*. She is commanded by Captain Dunn. This vessel is the first of her class ever built in Canada, and is a credit in every way to the Polson firm of Toronto. She carries a crew of officers and men all told, of 53.

SESSIONAL PAPER No. 21

' MONTCALM.'

Is a screw steel ice-breaker, length over 252 ft., breadth outside 40·55 ft., depth bottom of keel to top of deck 19·05 ft., displacement 2,130 tons, two sets of triple expansion engines speed $13\frac{1}{2}$ knots, with 4 Babcock & Wilcox water tube boilers, gross tonnage, 1,432 tons, indicated horse power 3,600, built by Messrs. Fleming & Ferguson, Paisley, Scotland. She is commanded by Captain Belanger.—*Fitted with Marconi Apparatus.*

' CHAMPLAIN.'

Is a single screw steel steamer. Length over all 132 ft., breadth outside 30 ft. 3 in., depth from top of deck to bottom of keel 11 ft. 3 in., displacement 550 tons, indicated horse power 850, her speed at trial $10\frac{1}{2}$ knots, she is fitted with one simple compound, surface condensing engine, and one multitubular Scotch boiler. She is commanded by Captain McGough.

' LADY GREY.'

The department has had built this year a twin screw steel steamer for work in the St. Lawrence ship channel; she arrived from England late during the past season, and was immediately put to work; she was built by Vickers Sons & Maxim of Barrow-in-Furness, England, and has proved a great success.

' ARCTIC.'

This vessel, after being overhauled and repaired, left for the northern waters of Canada on the 28th of July, 1906; it is the intention of the department that she should return some time next fall, and the attached reports that have already been received from Captain Bernier, the officer in charge, indicate that she is doing excellent work.

In addition to the above named vessels, there are four sea-going steam patrol launches, used on the Atlantic coast for the protection of the fisheries; and two on the River St. Lawrence and the Ottawa river, in connection with aids to navigation.

NUMBER OF OFFICERS AND MEN MANNING GOVERNMENT VESSELS.

The officers and crews of Government Steamers number 950 men all told approximately.

C.G.S. ' ARCTIC,' ALBERT HARBOUR, POND'S INLET,

BAFFIN LAND, September 29, 1906.

The Deputy Minister of Marine and Fisheries,
Ottawa.

SIR,—It affords me pleasure to advise you that the *Arctic* is safe and sound in Albert harbour, Pond's inlet, Northern Baffin Land, where we met the sloop *Albert*, and the whaler *Eclipse*, by whom we sent this letter.

After our departure from Father point we had a good deal of fortune; we were fortunate in the choice of the route through the middle pack, and we arrived first at Pond's inlet on August 19, 1906. We then proceeded north through Navy Board inlet, and took possession of all the Parry Arhepelago islands.

Commencing by Bylot island, Griffiths, Cornwallis, Bathurst, Byam, Martin, Melville, Prince Patrick, Emerald, Eglington, Garrett, Davy, Young, Russell, and Lowther islands, on the southern point of which I planted the flag, and called Colonel Gourdeau point; also please find photo' of same, with the state of the ice before we reached Melville island, and that of the first bear that paid his respects to His Majesty's ship, the *Arctic*, Albert harbour, Pond's inlet, where we are quartered for the winter; and different photos' of other views along our route so far.

6-7 EDWARD VII., A. 1907

We expect to leave here the latter part of July, for North Lincoln and Jones sound, and return after seeing the whalers that we have missed, on account of their being caught in the icepack, off Melville bay, about June. There are four of them.

We will proceed along Baffin Land to Cumberland sound, and Port Burwell, where we expect to receive news from civilization, and, after the season is over, will return home.

I remain, sir,

Your humble servant,

J. E. BERNIER,

Commanding Officer.

HALIFAX DOCK YARD.

The Royal Naval Dock Yards at Halifax were taken over by the Department of Marine and Fisheries on January 1, 1907. It is the intention of the department to install the whole of the departmental staff in Nova Scotia in the yard, and the transfer is now taking place.

A full report on this dock yard will be made later on.

Attached is a special report from the officer commanding the C.G.S. *Montcalm*, in regard to the ice-work performed by this vessel in the River St. Lawrence during the past season.

I have the honour to be, sir,

Your obedient servant,

O. G. V. SPAIN,

Commander Marine Service of Canada.

REPORT OF THE WORK DONE BY C.G.S. 'MONTCALM,' FROM DECEMBER 3, 1905, UP TO MARCH 31, 1906.

December 3.—Received orders from Department of Marine and Fisheries to get ready to proceed down to Manicouagan, Martin river, and to cut the ice ahead of the ss. *Lake Michigan*. We took coal and supplies on board for Manicouagan point, part of the day. Weather cloudy with light rain.

December 4.—At 3 p.m., left King's wharf and proceeded to Louise basin, and went alongside of the *Lake Michigan*, in order to be ready at daylight. Weather cloudy and calm.

December 5.—At 6.30 a.m. left Louise basin with the ss. *Lake Michigan*. Weather cold and fine, strong W.S.W. wind, river covered with ice from 5 to 8 inches thick. Proceeded ahead of her to cut the ice. At 4.30 p.m. stopped off Green island to let the pilot of the *Lake Michigan* get off, and then continued on. Strong west wind, ice light here. At 7 p.m. Bicquette light abeam. Shaped course for Manicouagan and set log.

December 6.—At 8.45 a.m. anchored at English bay in 25 fathoms, light S.W. wind with light snow. We landed all supplies for Messrs. Dobell and Beckett. At 11.35 a.m. finished landing supplies and proceeded for Martin river. At 1.45 p.m. Point des Monts light abeam, shaped course S.E. by E. $\frac{1}{4}$ E., and set log. At 5.30 p.m. anchored at Martin river and took all working men on board. At 7.35 p.m., left Martin river and proceeded up. Light snow and calm.

December 7.—At 12.20 a.m., Matane light abeam, four miles off, light N.E. wind with light snow. At 3.25 a.m., Father point abeam. At 7.30 a.m., Green island light abeam, with thick snow and calm. Met thick ice from White island to Quebec. At 3.15 p.m. arrived at Quebec and came alongside Pointe à Carey wharf. Weather fine and clear.

SESSIONAL PAPER No. 21

December 8.—Lying at Pointe à Carey wharf. Awaiting high tide to go to Davie's dock to change blades. Weather cloudy and strong N.E. wind throughout.

December 9.—Lying at Pointe à Carey wharf. Awaiting orders from Mr. Davie to go across to change our blades. Weather fine and clear, with strong N.E. wind throughout.

December 10.—Lying at Pointe à Carey wharf. Light east wind, with thick snow throughout.

December 11.—At 4 p.m., left Pointe à Carey wharf and proceeded to Lévis dock. Tried to get in, but could not, the water not having risen enough. Had to go back to Pointe à Carey wharf at 6 p.m., and moored her for the night. Weather cold and river covered with ice.

December 12.—Lying at Pointe à Carey wharf. Waiting for the high tide to get on the dock. N.E. wind, light, with light snow. River covered with ice.

December 13.—At 7 a.m. left Pointe à Carey wharf and proceeded across to Davie's dock, and got in all right. Light E.E.E. wind, with light snow throughout. At low tide Mr. Davie started to work to take off the blades. River full of ice.

December 14.—Lying at Mr. Davie's dock, working at every low tide changing blades. Weather fine and clear and cold, with light N.W. wind.

December 15.—Lying at Mr. Davie's dock and still working at the blades. Finished putting blades on at noon. At 8 p.m., at high water, left Mr. Davie's dock and came across to Pointe à Carey wharf. Weather fine and cold throughout with northerly wind.

December 16.—Lying at Pointe à Carey wharf. S.W. wind and weather fine. River covered with ice. At noon received orders to proceed up the river to pick up a buoy reported adrift in the ice. At 1.30 p.m., proceeded up as far as St. Nicholas, but could not see the buoy reported adrift. At 4 p.m., came back alongside Pointe à Carey wharf.

December 17.—Lying at Pointe à Carey wharf all day. Weather fine and calm throughout.

December 18.—At 10.35 a.m., left and proceeded up the river looking for a buoy reported adrift. Went as far as St. Nicholas, where we found the buoy adrift; we picked it up and proceeded down. At 12.30 p.m. came alongside of Kings wharf, and landed the buoy on the wharf, and then proceeded to Pointe à Carey wharf. Light S.W. wind and weather fine throughout. Ice drifting down the river freely.

December 19.—Lying at Pointe à Carey wharf taking coal all day. Light E.N.E. wind, and weather fine. Ice in the river running down freely.

December 20.—Lying at Pointe à Carey wharf all day. Weather fine and calm. Thick ice in the river.

December 21.—Lying at Pointe à Carey wharf, with strong easterly winds and snow. At 3 p.m. a blinding snow storm with gales from N.E. High water at 1.40 p.m., and at 3 p.m. current still running down, proceeded up as far as the bridge, found the river covered with heavy ice and batture ice. Making fast, had great difficulty turning the ship towards Quebec. Arrived at Pointe à Carey wharf at 5 p.m. Still blowing a gale, with blinding snow.

December 22.—At 7 a.m., left Pointe à Carey wharf and proceeded up the river as far as St. Nicholas. Strong S.E. wind, with heavy snow, river covered with ice, but running down freely. At 9.45 a.m. came alongside Pointe à Carey wharf.

December 23.—Lying at Pointe à Carey wharf all day. Light westerly wind, and weather fine throughout. Ice running down the river freely.

December 24.—Left Pointe à Carey wharf at 8 p.m., and proceeded up to Cape Rouge. River covered with ice, the batture ice getting larger opposite Fairchild's point up as far as Point Confederation. Ice running down freely. At 9.40 a.m. came alongside Pointe à Carey wharf.

December 25.—Lying at Pointe à Carey wharf all day. Light S.W. wind, and weather fine. First part fine, and light snow during latter part. The officers and quarter-masters received instructions, while at the wharf, to pay great attention to the rising of the tide and the running down of the ice.

6-7 EDWARD VII., A. 1907

December 26.—At 10.50 a.m., left and proceeded with ebb tide, meeting a great quantity of ice, but nothing heavy. Ship going ahead full speed as far as St. Nicholas wharf, but a heavy snow squall made us stop going ahead and forced us to keep her in the middle of the channel. At 12.20 p.m., put back for Quebec. Light S.W., with snow. At 2 p.m., came alongside Pointe à Carcy wharf.

December 27.—Lying at Pointe à Carcy wharf all day. Light S.W. wind, and weather fine throughout. Light ice on the river to-day.

December 28.—Lying at Pointe à Carcy wharf all day. Weather very fine and very mild. Crew employed washing ship. Light ice running in the river.

December 29.—At 12.55 p.m., left and proceeded up the river with strong N.E. wind, with thick snow. At 2 p.m. turned back at Point Confederation, at 2.50 p.m. came alongside Pointe à Carcy wharf. Ice light and running down freely.

December 30.—Lying at Pointe à Carcy wharf all day. Light N.E. wind, with light snow, and weather very mild.

December 31.—Lying at Pointe à Carcy wharf all day. Light W.S.W. wind and weather cloudy and mild. Ice light in the river.

January 1.—Lying at Pointe à Carcy all day. Weather fine and calm throughout. Ice in the river very light.

January 2.—At 1 p.m., left Pointe à Carcy and proceeded up the river as far as Pointe aux Trembles. River covered with ice, but nothing heavy. At 4.45 p.m., came alongside the Pointe à Carcy wharf. Weather fine and cold, with light N.W. wind.

January 3.—At 1.35 p.m., left the Pointe à Carcy wharf and proceeded up the river as far as Point Confederation; river covered with ice, but nothing heavy—about 6 to 8 inches in thickness—and running down freely. At 3.20 p.m. came back to the Pointe à Carcy wharf. Weather fine and cool, with light W. wind.

January 4.—At 7.35 a.m., left the Pointe à Carcy wharf and proceeded up the river as far as St. Nicholas. Ice very heavy opposite Cape Rouge. At 9.35 came alongside Pointe à Carcy wharf. Strong N.E. wind, with heavy snow storm. At 3.40 p.m., proceeded up the river again. Blinding snow storm, with easterly gale. Went up as far as the Quebec bridge. Ice running slowly on account of this heavy wind. At 5.55 p.m., came back alongside the Pointe à Carcy wharf for the night.

January 5.—At 7 a.m., left Pointe à Carcy and proceeded up the river as far as Cape Rouge bay. Heavy packed ice formed in the bridge up as far as Cape Rouge, but we cut it through up and down the river. At 10 a.m. came back alongside Pointe à Carcy wharf. Light S.W. wind, weather fine and cold.

January 6.—At 7 a.m., left Pointe à Carcy and proceeded up the river. Weather fine, with light west wind. At 8 a.m., turned back off Point Confederation. At 8.30 a.m., came alongside Pointe à Carcy wharf. Light scattered ice running down freely.

January 7.—At 7 a.m., left Pointe à Carcy and proceeded up the river. Light N.W. wind, weather fine and cold. At 8 a.m., turned around opposite Cape Rouge bay and proceeded down the river covered with ice, but nothing heavy. At 8.55 a.m. came alongside Pointe à Carcy wharf.

January 8.—At 8 a.m., left Pointe à Carcy and proceeded up the river as far as St. Nicholas wharf. River covered with heavy ice from the bridge to Confederation point. We cut it through and let it run down freely. At 10 a.m., came alongside Pointe à Carcy wharf. At 2 p.m., left the wharf and proceeded out to look for one of the gas buoys adrift: we picked up the buoy and laid it on the King's wharf, then returned to Pointe à Carcy wharf.

January 9.—At 9 a.m., left Pointe à Carcy and proceeded up the river. Weather very cold and vapour rising from the water. Went as far as Cape Rouge, at 10.25 a.m. turned back, ice heavy and packed from the bridge up to Confederation point. The 'jam' was solid: we cut through it until it broke away. At 11 a.m. it started running down. Came back alongside the Pointe à Carcy wharf.

January 10.—At 9 a.m. left Pointe à Carcy wharf and proceeded up the river as far as Confederation point. River covered with ice, but not very heavy. At 11.25 a.m. we cut the ice at the Beauport 'batture,' to keep the channel open. At 12.15

SESSIONAL PAPER No. 21

a.m. came back alongside the Pointe à Carcy wharf. Light N.W. wind, weather fine and cold.

January 11.—At 9.35 a.m. left Pointe à Carcy and proceeded up the river. Light S.W. wind, cloudy and mild weather. At 10.40 a.m. turned back to go down to Pointe à Carcy. River covered with heavy ice from the Quebec bridge to Cape Rouge, but it was running down freely. At 11.45 a.m. arrived at berth at Pointe à Carcy wharf.

January 12.—At 10 a.m. left Pointe à Carcy wharf, steamed up the river. Fresh N.W. wind with snow. Turned back opposite Cape Rouge at 11.05. Ice heavy, but running down freely. Put the ship in her berth at 11.35 a.m., at Pointe à Carcy.

January 13.—Lying at Pointe à Carcy wharf all day. Light W.S.W. wind. Weather fine and mild throughout the day. Ice running down the river freely.

January 14.—Lying at Pointe à Carcy wharf all day. Strong N.E. wind and cloudy weather.

January 15.—Left the Pointe à Carcy wharf at 11.30 a.m., and steamed up the river. Strong N.E. wind, weather cloudy. River covered with heavy packed ice for about one-half of a mile from the Quebec bridge up. The ship stopped several times in this 'jam,' but after some work we managed to cut through, and it started running down at 1 p.m. Went up as far as the Confederation point, and came back to the Pointe à Carcy wharf at 2 p.m.

January 16.—At 1 p.m. left from Pointe à Carcy wharf and went up the river as far as Cape Rouge bay. River covered with ice, but running down freely. At 2.55 p.m. came alongside the Pointe à Carcy wharf.

January 17.—At 1.30 p.m. left from Pointe à Carcy and proceeded up the river, fresh W.S.W. wind and weather fine; found the ice stopped from Quebec bridge up to Cape Rouge; very heavy jam. We cut through about a half-mile and the ship stuck fast and would not go astern. We tried to back her until dark, and then we stopped the engines and transported coal from the fore-hold to the after bunkers. At 11.50 p.m. she backed off the jam with difficulty. The ice in the jam was from 10 to 15 feet thick. We had to work for twelve hours at it before ship could be freed and the jam started. At midnight, working the ship with the jam the best I could astern and ahead until we were down off the piers of the Quebec bridge, from there I managed to turn the ship and work my way down to Pointe à Carcy.

January 18.—At 1.10 a.m. came alongside Pointe à Carcy wharf. Light west wind, weather fine. Waiting for daylight to go back in the jam. At 7.30 a.m., light N.E. wind, with thick snow. At 1.50 p.m., left Pointe à Carcy and proceeded up the river. Fresh N.E. wind with thick snow. Went up to Cape Rouge bay. Ice heavy and packed, but running down freely. At 4.25 p.m. came back alongside the Pointe à Carcy wharf.

January 19.—At 7.30 a.m. left Pointe à Carcy and proceeded down the river, for the ss. *Bavarian*, with a party of inspectors and others. Light west wind; weather fine and cold. At 10.30 a.m. came alongside the ss. *Bavarian* and landed the passengers on board. At 1.15 left the ss. *Bavarian* and proceeded up the river. At 3.45 p.m. came alongside the King's wharf, and landed the party and proceeded up as far as Cape Rouge. Came alongside the Pointe à Carcy wharf at 5.20 p.m., in very heavy ice. Ice very heavy also as far as Cap Rouge, but it is running down freely.

January 20.—At 4 p.m. left Pointe à Carcy and proceeded up the river in a heavy snow storm. Went up to the Quebec bridge. River covered with ice, but running freely. Strong N.E. wind with snow. Came back to the Pointe à Carcy wharf at 5.35 p.m.

January 21.—Lying at Pointe à Carcy wharf all day. Light E.N.E. wind, with rain. Ice running down the river freely.

January 22.—At 7 a.m. left Pointe à Carcy and proceeded up the river. Light east wind and weather very mild. Steamed up to Cape Rouge. Ice running down freely. Went to cut some ice for Mr. E. Dussault, at the head of his wharf under construction. At 10.15 a.m. arrived back at Pointe à Carcy wharf.

January 23.—Lying at Pointe à Carey wharf all day. Received orders to have the ship ready to go to Seven islands, to take coal and provisions on board. Light east wind. Weather thick. Thick ice running down the river.

January 24.—Lying at Pointe à Carey wharf all day. Still taking coal on board. Weather fine and calm. Ice running down freely in the river.

January 25.—Lying at Pointe à Carey wharf all day. Ship ready for trip down to Seven islands, waiting for orders to go. Light E.N.E. wind, with light snow.

January 26.—At 7 a.m. left Pointe à Carey and proceeded for Seven islands, with gentlemen, mail and medicine supply on board. Light S.W. wind, weather cloudy. River covered with ice. At 9.25 Crane island light abeam. Ice very heavy. At 5.40 p.m. Picquet light abeam, three miles off. Changed course E. by N. and could not set log on account of ice. Ice very heavy from Quebec to Bic. Ice from Bic down to Seven islands not quite so heavy. At midnight off Pointe des Monts, about six miles off, same weather.

January 27.—At 12.30 a.m. changed course N.E. by E. $\frac{1}{2}$ E. Fresh S.W. wind, and weather cloudy. At 2 a.m. thick snow. At 3.40 a.m. stopped off Seven islands, waiting for daylight. Strong S.W. wind, and thick snow. Cast the lead 130 fathoms deep. At 7 a.m. weather got clear, proceeded into the bay. Ice from the out island into the bay is from 20 to 24 inches thick. At 10 a.m. stopped inside Sandy point, and landed all supplies. At 2 p.m. left Seven islands bay and proceeded out. Strong W.S.W. wind. At 2.45 p.m. ship one mile off Carousel island. S.W. by W. $\frac{1}{4}$ W. Light ice. At 7.20 p.m. Pointe des Monts abeam, six miles off. Changed course W. by S. $\frac{1}{4}$ S. At midnight off Father Point. Light S.W. wind, and weather very thick. Light ice running slowly.

January 28.—At 2.10 a.m. anchored three miles east of Bicquet in 18 fathoms of water. Light S.W. wind, and weather very thick. Waiting for daylight. At 6.30 a.m. proceeded up. Light S.W. wind and smoky weather. At 1 p.m. Kamouraska light abeam. At 4.10 p.m. Crane island light abeam. At 6.25 p.m. arrived at Quebec and came alongside Pointe à Carey wharf. Light N.W. wind, and weather fine.

January 29.—At 11 a.m. left Pointe à Carey wharf and proceeded up the river as far as Cape Rouge. Light westerly wind and weather very cold, and thick vapour rising from the river. At 1 p.m. came back alongside of Pointe à Carey wharf. Ice running down freely.

January 30.—At 11.55 left Pointe à Carey wharf and proceeded up the river as far as Cape Rouge. River covered with ice running down freely. At 1.25 p.m. came back alongside Pointe à Carey wharf.

January 31.—Lying at Pointe à Carey wharf all day. Light east wind, with light snow throughout, and weather very mild.

February 1, 1906.—At 1.10 p.m. left Pointe à Carey wharf and proceeded up the river with the Marine Engineers' Association of Canada on board. At 2.40 p.m. turned off St. Nicholas and came down the river as far as St. Joseph, de Lévis. At 4 p.m. came alongside Pointe à Carey wharf. Light east wind, weather mild and cloudy. Landed all engineers.

February 2.—Lying at Pointe à Carey wharf, weather very cold, vapour rising from the river very thick, ice running down freely.

February 3.—At 1 p.m. left Pointe à Carey wharf and proceeded to Mr. E. Dussault's wharf to cut the ice at the end of the wharf as far inside as possible for the safety of the ship, and also proceeded up the river and found that the ice from the bridge up to Cap Rouge was stopped, we cut it up and down twice, and the last time the ice started to run down freely; it was very heavy. At 4 p.m. came back alongside Pointe à Carey wharf. Light N.N.W. wind, weather very cold and vapour rising from the river very thick.

February 4.—Lying at Pointe à Carey wharf all day. Light N.E. wind, with snow throughout and weather mild.

February 5.—At 7.20 a.m. left Pointe à Carey wharf and proceeded up the river. Light N.W. wind. Weather fine and cold. Went up as far as Point Confederation.

SESSIONAL PAPER No. 21

At 10 a.m. came back alongside Pointe à Carcy wharf; from the bridge up to Cap Rouge ice very heavy, but running down freely.

February 6.—At 7 a.m. left Pointe à Carcy wharf and proceeded up the river. Light N.W. wind, weather very cold. Went up as far as Point Confederation. At 9 a.m. came back alongside Pointe à Carcy wharf. Vapour rising from the river very thick. River covered with light ice running down freely.

February 7.—At 7 a.m. left Pointe à Carcy wharf and proceeded up the river as far as St. Nicholas wharf. Ice running down freely, weather very cold, fresh N.W. wind. Vapour rising from the river very thick. At 9.30 p.m. came back alongside Pointe à Carcy wharf.

February 8.—At 8 a.m. left Pointe à Carcy and proceeded up the river. We found ice stopped from Sillery pointe up to Cap Rouge; went up and down through it twice, as far as Point Confederation, with difficulty, but the ice started running down freely. Also went to cut the ice at Mr. Dussault's wharf, and large piece off Beauport batture ice. At 1 p.m. came back alongside Pointe à Carcy wharf. Fresh easterly wind, weather cloudy.

February 9.—Left Pointe à Carcy at 9.30 a.m. and proceeded up the river. N.E. wind, with snow. Went as far as Point Confederation. River covered with heavy ice, but running freely, and also was down to Mr. Dussault's wharf at 11.30 a.m. Came back alongside Pointe à Carcy wharf with snow at 2 p.m. Heavy snow storm, with gale of E.N.E. wind.

February 10.—Left Pointe à Carcy at 8.45 a.m. and proceeded up the river as far as St. Nicholas. River covered with heavy ice, and met a large field of batture ice, cut through it and let the ice run down freely. At 12.10 p.m. came back alongside Pointe à Carcy wharf. Light S.W. wind, weather fine.

February 11.—Left Pointe à Carcy at 8 a.m. and proceeded down to cut the ice off Mr. Dussault's wharf. Working two hours; cut about 100 feet inside the end of his wharf, which was as far as we could go with the ship on account of the depth of the water. Also proceeded up the river as far as Cap Rouge; ice heavy, but running down freely. At 11.40 a.m. came back alongside Pointe à Carcy wharf. Weather fine and calm throughout.

February 12.—At 8.30 a.m. left Pointe à Carcy and proceeded down to Mr. Dussault's wharf and cleared away all the ice we had cut yesterday, about 100 feet inside the end of the wharf. Weather fine, with light S.W. wind. At 9.30 a.m. came back alongside Pointe à Carcy wharf.

February 13.—At 8.30 a.m. left Pointe à Carcy to proceed down to Mr. Dussault's wharf, and we cut the ice a little farther inside than yesterday; worked at it two hours, and came back alongside Pointe à Carcy wharf at 10.30 a.m. Light S.W. wind, weather fine. Ice running down in the river freely.

February 14.—At 1.45 p.m. left Pointe à Carcy and proceeded up the river as far as the bridge; river covered with ice and running down slowly. Strong easterly wind, with blinding snow storm. At 3 p.m. came back alongside Pointe à Carcy wharf, the storm still raging.

February 15.—At 1.45 p.m. left Pointe à Carcy and proceeded up the river as far as Cap Rouge. Strong easterly wind, with heavy snow. River covered with heavy ice, but running down freely. At 3.15 p.m. came back alongside Pointe à Carcy wharf with difficulty on account of thick snow. Weather fine and clear at 4.30 p.m.

February 16.—At 1.35 p.m. left Pointe à Carcy and proceeded up the river. Light N.W. wind, weather fine and cold. Turned off Cap Rouge bay. River covered with heavy thick ice running down freely, and also cut a large piece off Beauport batture. At 4.45 p.m. came back alongside Pointe à Carcy wharf.

February 17.—At 1.30 p.m. left Pointe à Carcy and proceeded down to Mr. Dussault's wharf. Broke up all new ice and some of the old, and got inside as much as we could. Saw sand and mud rising to the surface of the water. Worked about two hours. Also proceeded up the river as far as Cap Rouge; ice very heavy, but running

6-7 EDWARD VII., A. 1907

freely down. At 4.30 p.m. came back alongside Pointe à Carcy wharf. Light N.W. wind, and weather very fine.

February 18.—Lying at Pointe à Carcy wharf all day. Light N.E. wind; weather fine and mild. Ice running down freely.

February 19.—Lying at Pointe à Carcy wharf all day. Weather fine and mild. Very little ice on the river to-day.

February 20.—At 6.30 a.m. left Pointe à Carcy wharf and proceeded up the river as far as Point Confederation. Light ice on the river. Weather cloudy and thick snow. At 8.30 a.m. came back to Pointe à Carcy wharf.

February 21.—Lying at Pointe à Carcy wharf all day, took coal. Weather calm, with light rain throughout.

February 22.—Lying at Pointe à Carcy wharf all day. Light N.W. wind. Weather very fine throughout. Crew employed painting outside of ship.

February 23.—At 6.30 a.m. left Pointe à Carcy and proceeded out. Light N.E. wind, and weather very fine. Working cutting ice at end of Mr. Dussault's wharf for about one hour, and also up the river as far as Cap Rouge bay. Met only light scattered ice running down freely. At 9.25 a.m. came alongside Pointe à Carcy wharf. Crew employed painting ship.

February 24.—Lying at Pointe à Carcy wharf all day. Weather fine, mild and calm throughout. Crew employed painting and cleaning ship.

February 25.—Lying at Pointe à Carcy wharf all day. Weather cloudy and calm. Very little ice on river to-day. At 7 p.m. heavy rain.

February 26.—Lying at Pointe à Carcy wharf all day. Light easterly, with thick snow. Light ice on river to-day.

February 27.—Lying at Pointe à Carcy wharf all day. Light S.W. wind. Weather very mild. Light ice on river. Crew very usefully employed.

February 28.—At 9 a.m. left Pointe à Carcy wharf and proceeded down to Mr. Dussault's wharf. Worked one hour cutting ice at end of wharf as far inside as possible for safety of ship, also went up the river and found a large piece of batture ice jammed from the bridge up for about two miles, very heavy, from two to three feet thick; took four hours to cut it through. At 2.30 p.m. ice started to run down freely. Fresh N.W. wind. Weather fine and cold throughout. At 3 p.m. came back alongside Pointe à Carcy wharf.

March 1.—At 11 a.m. left Pointe à Carcy and proceeded up the river. Fresh west wind, and weather very fine but cold. At 12.45 p.m. turned off Point Confederation; river covered with ice, but nothing heavy, and running down freely. At 1.40 p.m. came back alongside Pointe à Carcy wharf.

March 2.—Lying at Pointe à Carcy wharf all day. Light S.W. wind and weather fine. Crew employed for painting.

March 3.—Left Pointe à Carcy at 12.20 p.m., and proceeded down to cut the ice at the end of Mr. Dussault's wharf; worked at it one hour, also proceeded up the river as far as Cap Rouge bay. River covered with ice, but running down freely. Fresh east wind, with thick snow. At 2.25 p.m. came alongside Pointe à Carcy wharf, same weather.

March 4.—Lying at Pointe à Carcy wharf all day. Fresh N.E. wind, with heavy snow storm. At noon light snow; ice running freely.

March 5.—Left Pointe à Carcy at 2 p.m. and proceeded down to cut the ice at the end of Mr. Dussault's wharf. We worked at it one hour, and also proceeded up the river as far as Cap Rouge bay. River covered with ice, but running freely. Light northerly wind. Weather fine and clear. Came back to Pointe à Carcy wharf at 4.30 p.m.

March 6.—Lying at Pointe à Carcy wharf all day. Light west wind and weather fine throughout. Crew employed painting ship. Light ice running down the river.

March 7.—Lying at Pointe à Carcy wharf all day. Light west wind. Weather fine and mild throughout. Crew employed cleaning and painting ship. Light ice running down the river.

SESSIONAL PAPER No. 21

March 8.—Left Pointe à Carcy wharf at 2.30 p.m., with Civil and Mining Engineers' Association party on board, sent by J. U. Gregory, Esq., and proceeded up the river as far as Point aux Trembles. Light ice in the river. Weather fine and mild. Came alongside Pointe à Carcy at 4.50 and landed all the party; same weather.

March 9.—Lying at Pointe à Carcy wharf all day. Weather cloudy and calm throughout. Crew employed cleaning ship.

March 10.—Left Pointe à Carcy wharf at 6 a.m., and proceeded down to cut the ice at the end of Mr. Dussault's wharf; we worked at it one hour, and also proceeded up the river as far as bridge. Light ice running down freely. S.W. wind, weather fine and very mild throughout. Came alongside Pointe à Carcy wharf at 8 a.m.

March 11.—Lying at Pointe à Carcy all day. Strong S.W. wind and weather fine. At noon large piece of batture ice running down freely.

March 12.—Lying at Pointe à Carcy wharf all day. Light S.W. wind and weather fine. Light ice running on the river. Crew variously employed.

March 13.—Left Pointe à Carcy at 9.15 a.m. and proceeded up the river as far as Point Confederation. Light N.W. wind. Weather fine and cold. Came alongside Pointe à Carcy wharf at 11.30 a.m. Light ice running down freely.

March 14.—Lying at Pointe à Carcy wharf all day. Fresh N.W. wind. Weather fine and very cold throughout. Light scattered ice running down the river. Crew employed variously.

March 15.—Left Pointe à Carcy at 9.30 and proceeded down to Mr. Dussault's wharf to cut the ice. We worked at it for one hour and also proceeded up the river as far as Point Confederation. River covered with ice, but nothing heavy, and running down freely. Came alongside Pointe à Carcy at noon. Weather fine and calm throughout.

March 16.—Lying at Pointe à Carcy wharf all day. Light S.W. wind, and weather fine throughout; light ice running down the river. Crew employed variously.

March 17.—Left Pointe à Carcy at 1 p.m., and proceeded up the river as far as Cap Rouge. River covered with new ice, but nothing heavy, and also proceeded down to cut the ice at Mr. Dussault's wharf. Fresh S.W. wind, and weather very fine throughout. Came alongside Pointe à Carcy wharf at 3.20 p.m.

March 18.—Lying at Pointe à Carcy wharf all day. Light N.W. wind. Weather fine and very cold throughout.

March 19.—Lying at Pointe à Carcy wharf all day. Weather fine and clear. Wind variable throughout.

March 20.—Lying at Pointe à Carcy all day. Received order to get ready for Seven Islands trip, taking coal and provisions and also supplying with medicines, &c., &c. Strong easterly wind, with heavy snow throughout. Ship ready for sea at 5.30 p.m.

March 21.—Left Pointe à Carcy at 7 a.m., and proceeded down the river for Seven Islands, with Mr. Scott, Judge Simard, Dr. Beaumier, Mr. Cinq-Mars to represent *La Presse*, Mr. Sirois, of the *Soleil*, and Mr. Prince, for *La Patrie*, and also four policemen. Light S.W. wind, and weather cloudy. Heavy ice from Bellechasse island down to the lower pier of the Traverse at 10.40 a.m. Strong S.W. wind, light scattered ice as far as Cap au Saumon, but from there down to Bic no ice. Bicquette at 4.40 p.m. abeam. Shaped course for Pointe des Monts, met heavy ice off Father Point and cut it through as far as Godbout river, at Pointe des Monts lighthouse 10.40 p.m. abeam. Shaped course for Seven Islands. Light S.E. wind, and weather cloudy; light ice. Off Egg island at midnight.

March 22.—At 2.45 a.m. stopped off Seven Islands, and waiting for daylight. At 5.25 a.m. got under way, and at 6.30 a.m. stopped off Seven Islands village in the ice from 2 feet thick, and landed Mr. Scott, Judge Simard and Dr. Beaumier, also landing all supplies and giving order not to let anyone on board from the shore, and not allowing any of the crew to go ashore on account of contagious diseases. 2 p.m., blowing a heavy gale from S.E., with thick snow. Lying in the bay of Seven Islands, hard and fast in the ice, waiting on those gentlemen. At 10 p.m. wind shifted to W.S.W., with the same velocity, and the ice in the bay beginning to break off. Had to drop anchor.

March 23.—Lying in the bay of Seven Islands waiting for Judge Simard, Mr. Scott and all the other gentlemen. Strong N.W. wind. Weather fine and very cold. At 4.30 p.m. Judge Simard came on board. Had to wait here for the other gentlemen. Held for the night.

March 24.—At 2 p.m. all these gentlemen arrived on board. At 3 p.m. left Seven Islands and proceeded out. Light N.N.W. wind. Weather fine, but very cold. At 8 p.m. stopped off Pointe des Monts and landed the mail for Godbout. At 8.50 p.m. proceeded on our way up. At midnight off Metis. Ice very light.

March 25.—At 2.40 a.m. Bicquette abeam. Fresh N.W. wind and weather fine. At 4 a.m. slowed down off Basque island to wait for daylight. At 5.20 a.m. Green Island light abeam. Full speed. Met very heavy ice from White island up to Quebec. At 3.40 p.m. arrived at Quebec and came alongside of Pointe à Carcy wharf and landed all these gentlemen.

March 26.—Lying at Pointe à Carcy all day. Weather cloudy and calm. Ice in the river running down freely. Taking coal on board.

March 27.—At 8.15 a.m. left Pointe à Carcy wharf and proceeded down to cut the ice at Mr. Dussault's wharf, and a large piece of batture ice; working at it for one hour; also proceeded up the river as far as the Quebec bridge. Ice light, and running down freely. At 10.30 a.m. came alongside Pointe à Carcy wharf. Light S.E. wind and heavy rain and thick weather.

March 28.—Lying at Pointe à Carcy wharf all day. weather very fine and mild throughout; taking coal, crew employed painting ship.

March 29.—Lying at Pointe à Carcy wharf all day. light S.W. wind and weather fine and mild throughout. light ice running down the river, still taking coal.

March 30.—Lying at Pointe à Carcy wharf all day, weather fine. calm and very mild throughout. very light ice in the river, crew employed painting and scraping woodwork.

March 31.—Lying at Pointe à Carcy wharf all day; west wind, weather very fine, crew employed in painting. very little ice in river.

During these four months, distance running through ice was 2,987 miles.

I am, sir, your obedient servant,

CHARLES KOENIG,
Captain Canadian Government Steamer 'Montcalm.'

SESSIONAL PAPER No. 21

APPENDIX No. 14.

INVESTIGATIONS INTO WRECKS.

OTTAWA, CANADA, January 12 1907.

To the Deputy Minister of Marine and Fisheries,
Ottawa.

SIR,—I have the honour to submit my report upon the casualties and accidents that have occurred upon the coasts of Canada, and the Great Lakes, during the past season of navigation.

Investigations were held on the following vessels:—

Agnar-Monmouth, stranding of *Agnar* SS.; *Agnar-Thor*, collision; *Angola*, stranding; *Aranmore-Alexander Rudolph*, collision; *Clarisse*, stranding; *Elina*, stranding; *Etolia*, stranding; *Gaspesian-Elevator No. 7*, collision; *Golspie*, stranding; *Havanna*, collision; *Hazelton*, collision; *Hestia*, stranding; *Islander*, foundering; *Kensington*, stranding; *Mount Royal*, collision; *Mystic*, stranding; *Ottawa-Maude*, collision; *Pomeranian*, striking Father Point wharf; *Princess*, foundering; *Rembrandt*, foundering; *Resolute*, foundering; *Valencia*, stranding; *Victoria*, stranding.

The evidence and judgment in each of the above cases are on file in the Department.

The above list comprises all casualties of importance, which occurred during the past season, especially where loss of life ensued. My instructions are to investigate, as far as possible, but, it is out of the question that every casualty can be investigated as, owing to the fact that the department has very often to rely on the press for information with regard to shipping disasters; it, therefore, often is the case that accidents occur to vessels, and the facts do not become known to the department in sufficient time for an investigation to be carried on. If owners of vessels, and agents, would notify the department directly accidents occur, it would be of great benefit all round.

The St. Lawrence route has been singularly clear from accidents during the past season, none of any importance having occurred, with the exception of the *Mystic*, which went ashore on Crane island in July.

The total value of the trade of the St. Lawrence route for the fiscal year ending June 30, 1906, was \$151,571,214, an increase of \$30,637,660 over the year 1905.

The Shipping Casualties' Act has lately been amended, and the following changes have been made:—

1. A wreck commissioner has been appointed to hold investigations in all parts of the Dominion.

2. A statement of the case need not be issued as heretofore, before the commencement of the proceedings, where a certificate is to be dealt with; the defendant's certificate may be cancelled or suspended, after he has been furnished with a copy of a statement of the case, and had an opportunity of making a defence.

3. An investigation may be held into the stranding of any vessel, whether damaged or not.

4. Two assessors have been appointed, one each, for the ports of Montreal and Quebec; Captain Archibald Reid and Captain John Temple. These officers have been appointed for a term of three years.

A full statement of wrecks and casualties that have occurred during the twelve months ending June 30, 1905, in Canadian waters and to Canadian sea-going vessels in other waters, will be found in the supplement of this report.

I have the honour to be, sir,

Your obedient servant,

O. G. V. SPAIN.

Wreck Commissioner.

DEPARTMENT OF MARINE AND FISHERIES,

OTTAWA.

SESSIONAL PAPER No. 21

APPENDIX No. 17.

REPORT OF SUPERINTENDENT OF SABLE ISLAND.

SABLE ISLAND, July 2, 1906.

Superintendent of Lights
for Nova Scotia.

SIR,—I submit the following report for the year ending June 30, 1906 :—

Fortunately no wrecks or casualties occurred during the year.

Boats and apparatus are in the condition last reported, having been used only for drills and the landing of supplies, and met with no accident.

PATROL.

The island was patrolled fifty-six times, forty-three times in the morning, and thirteen times at night.

BUILDINGS AND REPAIRS.

No. 1 Station.

Coal house, 16 x 25 built and forge refitted.

Sailors' Home.

South side of roof removed and two gables put on so as to make a carpenters' shop on second floor. Addition to store room, 10 x 14.

No. 2 Station.

General repairs to shingles.

No. 3 Station.

West side roof of cattle barn reshingled. New concrete block foundation put under horse stable.

STOCK.

Both cattle and horses wintered well, due to the mild weather. At present all are in splendid condition, and the increase among the wild horses is, I think, above the average.

KILLED.

Eleven beeves weighing 6,608 pounds; consumed mostly fresh. Ten hogs weighing (approximate) 2,000 pounds; shipped.

SHIPPED.

Fifty pounds of cranberries, salted hides and old metal.

SAILORS' CLOTHING ON HAND.

Sixteen jackets, 13 pair pants, 11 vests, 23 shirts, 13 caps, 15 suits underclothing, 31 pairs brogans, 17 pair socks.

BEDDING.

Twenty mattresses, 75 pairs blankets, 10 pillows, 5 spreads, 40 ticks.

LIVE STOCK.

Eighty-five head horned cattle, 35 trained horses, 2 stock stallions, 6 stock mares, 200 wild ponies.

UNIFORMS FOR STAFF.

A supply was received May 4 and on June 1 each man was supplied with three complete suits, two of white duck and one of blue, comprising pants, sweater and cap.

CENSUS.

No. 1 Station.

Superintendent R. J. Boutilier and family, including servant, 4 ; M. Noonan, Sydney Himelman, Thomas Naugle, John Faulkner, Richard S. Boutilier, R. Cleary (cook), John Dunn (carpenter), 8—12.

No. 2 Station.

Ruben Naugle, wife and child, 3.

No. 3 Station.

James Ritcey, wife and child, 3 ; Arthur Negus, assistant, 1—4.

No. 4 Station.

Gustav Soderburg and wife, 2 ; Alex. Byrne, Edward McKenzie, 2—4.

No. 5 Station—W. Light.

A. J. Horne, wife and family, 6 ; John Glazebrook, 1.—7.

No. 6 Station—E. Light.

W. H. Horne, wife and family, 6 ; Henry Naugle, 1.—7.

Marconi Wireless Station.

L. R. Johnston (chief), Henry Peirson, Walter Gray, James Boutilier, Theophilis Strickland (cook), 5.

Total, 42.

I remain your most obedient servant,

(Sgd.) R. J. BOUTILIER,
Superintendent of Sable Island.

SESSIONAL PAPER No.

APPENDIX No. 18.

THE HUDSON BAY EXPEDITION.

EXTRACT OF REPORT OF MAJOR J. D. MOODIE.

Major Moodie, of the Royal Northwest Mounted Police, was in command of the government steamer *Arctic*, Captain Bernier, sailing master.

'The *Arctic* left Quebec on September 17, 1904, and arrived at Port Burwell, Ungava bay, on October 1. No ice was encountered on the voyage until we got to within a few miles of Fullerton harbour, when we ran through some slob ice, floating in and out with the tide. The inner harbour where we anchored was frozen over to a thickness of about four inches.'

'The winter passed quickly and pleasantly. The weather was not exceptionally cold, the lowest temperature being 52 degrees below zero.'

'On July 1, 1905, the *Arctic* commenced breaking her way out of Fullerton harbour. On July 8 the engines stopped, and on going on deck it was found that both blades of the propeller were broken off short, close to the boss. The chief officer was in charge of the deck at the time. Tackle was at once rigged, and the broken propeller hoisted up. By 7 a.m. next day a new one was fitted and partly lowered, when it was found that the slot to take the shaft key was not cut in the proper place and the blades would not pass through the trunk. This propeller had to be unshipped, and another which had been brought from Germany, up out of the hold. At 11 a.m. this was fitted and everything in place, and at noon we were once more under way.'

On the 10th the ice being still packed tight and no sign of open water to the south or west, I reluctantly abandoned the idea of getting to Churchill. There is no doubt we could have made it without difficulty; it was only a matter of time. I could not, however, take the risk of being delayed so long that there would not be time to look for another harbour in the straits before the arrival of the supply steamer. With a good steamer with plenty of power there would have been no difficulty in forcing a passage through almost any of the ice encountered, and no danger. During the day the ice opened, and we made some progress north until 3 p.m., when Captain Bernier reported the ice was closing and that it was unsafe to proceed.

'On the 14th ran clear of all ice in afternoon, and shaped course for Cape Southampton, Coates island, distant about 75 miles. Cape Southampton was made at 5.15 p.m. on the 15th and Mansfield at 9 p.m. Only a few small pieces of ice floating about here and there. On the 16th, between Mansfield and Digges islands a few small pieces were scattered about. Erik cove was made at 1 p.m. There were a few pieces of ice aground at the head of the harbour and some small bits floating in and out with the tide.'

'About 40 miles down the coast we saw what was supposed to be the harbour spoken of by Mr. Low and Captain Comer last year. Lay-to all night, and on the morning of the 18th steamed slowly up to the entrance. About six miles up the harbour we were stopped by a bar, and anchored in a cove. In the afternoon I took a boat across the bar to head of harbour, about 3 miles further up. There a good sized river empties in.'

'The land rises to a considerable height, with good flat benches along the river. These and the surrounding hills are covered with grass. The passage over the bar is too shallow to take a vessel through without considerable risk, and then only at high water. The only drawback to the harbour is that wherever the land is suitable for building the shore is shallow.'

The *Arctic* was moved to her new berth, and when the anchor was down the flag was run up and the harbour called Préfontaine harbour, the headland on the east side of the entrance being named Cape Laurier, and the island on the west side of entrance White island. This place is not shown on any chart, and is the best harbour we have seen; it averages about $1\frac{1}{2}$ miles across. The natives say it was open this year about June 1, and that no heavy ice ever comes in from the strait. None was seen when we arrived, although there were patches of snow on the hills. On the 20th and 21st the boats were employed landing goods, and all but a few packages were got ashore. Tents were pitched and all perishable goods housed.

‘On September 23, I received orders to send the *Arctic* to Quebec for certain alterations and repairs, and to proceed north with the *Neptune*.’

EXTRACT RELATING TO THE LENGTH OF TIME THE STRAITS CAN BE NAVIGATED.

‘From my two years’ experience there should be no danger to any well built and well engined steamer in coming into the strait and bay early in July. Possibly she might be delayed somewhat by ice if the winds had been continuous from the north-east, but she should not be in any danger. Everything depends upon what the prevailing winds have been, and last year is but little guide to this. In my opinion, and that of good men whom I have consulted, the south side of the strait is the best for steamers coming in. For sailing ships the north side is generally to be preferred as far as Big island, crossing from there to Diggas islands.’

MOVEMENTS OF ‘ARCTIC’ IN 1906.—CAPTAIN BERNIER’S REPORTS.

The *Arctic* returned to Quebec, arriving on October 6, 1905. The necessary alterations were made at Sorel, and the steamer resumed her work in connection with the Hudson bay expedition on July 28, 1906. Instructions were given to proceed direct to Lancaster Sound, calling at Pond’s Inlet, to serve notice to the whalers there or in Barrow strait, west of Erebus bay.

The following report was received from Captain J. E. Bernier, dated C.G.S. *Arctic*, Chateau Bay, August 3, 1906.: ‘I arrived here at 10 a.m. to-day, all well. I received your telegram, and left at once for Pond’s inlet, Erebus bay, and if possible Winter harbour, Melville island. I am endeavouring to push forward so as to be in time before the winter sets in. During the winter I will get ready for spring travelling. Will erect cabins at the different places of call, as per my last letters. Will be glad to receive commission letters and papers at Port Burwell next summer so I can get them during the fall, with any letters for officers and men. The officers, men and myself are all in good health, and wish to be remembered to the minister, yourself and other officers who wish our welfare.’

The following report was received from Captain Bernier, dated C.G.S. *Arctic*, Pond’s Inlet, Baffin Land, September 29, 1906:—

C.G.S. ‘ARCTIC.’

POND’S INLET, BAFFIN LAND, September 29, 1906.

The Hon. L. P. BRODEUR, P.C.,

Marine and Fisheries, Ottawa, Ont.

DEAR SIR,—I beg to inclose a copy of photographs taken by Mr. Lancefield during our trip last month, with the view of Albert harbour. We are now in winter quarters.

We have been expecting every day whalers to come, to serve notice upon them and collect dues and give them licenses.

We have done wonderfully well so far, and we have decided not to winter in Melville island, on account of the heavy ice from the Arctic and considering the amount of provisions on hand. The coast about Melville island does not open every year, and there being a risk of passing another winter there, it was decided after consultation that we could do nothing effective there, having taken possession of Melville island,

SESSIONAL PAPER No. 21

Price Patrick, Eglinton, Emerald, Byam Martin, Bathurst, Cornwallis, Griffiths, Lowther, Young's, Garret, Russell, Davy and Bylot islands.

We are now watching the whalers that might come any day. I am contemplating to leave here the latter part of July, to proceed to the northward towards Lincoln island and Jones sound.

We shall have used one-half of our coal by the spring. I may mention here that we have left a depot of provisions of five thousand seven hundred and eighteen pounds of selected articles at Port Leopold, and built a house over the same. At Erebus bay, we have restored the Sir John Franklin monument and placed the stone in a proper place and also repainted the headstones of the men's graves.

The *Arctic* is safe and sound, and has done her duty well, it is not expected of her that she can pass through ice of several seasons' growth, but with time she can go through all right.

The officers and crew are all well, happy and contented with their lot. We had the good fortune of having a large iceberg aground just near us, so our fresh water supply will be secure for the winter.

With our supply of guns and ammunition we expect to secure a supply of fresh meat for our use the coming winter. We have no less than sixty-five traps set out, and it is dangerous to come near the *Arctic*.

The officers and men wish to send their respects to yourself, and the heads of the department, for what you have done, both for us and our beloved ones left behind. We would consider it a favour if you will advise them through the press so we may receive their letters at Port Burwell, Hudson bay.

I have the honour to remain, sir,

Your obedient servant,

(Sgd.) J. E. BERNIER,
Commanding Officer.

P.S.—The captain of the Dundee whaler *Eclipse* said that they will bring letters in to Pond's Inlet before we leave here. Please give notice through the Press.

Your obedient servant,

(Sgd.) J. E. BERNIER.

REPORT ON SHIPPING

To the Honourable

L. P. BRODEUR,

Minister of Marine and Fisheries.

SIR,—I have the honour to submit herewith the Sixteenth List of Shipping issued by this Department, being a list of the vessels whose names remained on the registry books of the Dominion of Canada on the 31st day of December, 1906, giving the name of each ship, her official number, the port at which she was then registered, her rig, where she was built, the year in which she was built, her register dimensions and her register tonnage. In the case of steamers, the list shows the gross tonnage as well as the net tonnage of each steamship. The list also shows the name and address of the owner of each vessel, but in cases where there are more than one owner, the name and address of the managing owner, if known, is given.

The total number of vessels remaining on the register books of the Dominion on the 31st December, 1906, including old and new vessels, sailing vessels, steamers and barges, was 7,512, measuring 654,179 tons register tonnage, being an increase of 187 vessels, and a decrease of 15,646 tons register, as compared with 1905. The number of steamers on the registry books on the same date was 2,810, with a gross tonnage of 375,263 tons. Assuming the average value to be \$30 per ton, the value of the registered tonnage of Canada, on the 31st December last, would be \$19,625,370.

The number of new vessels built and registered in the Dominion of Canada during the last year was 397, measuring 21,741 tons register tonnage. Estimating the value of the new tonnage at \$45 per ton, it gives a total value of \$978,345 for new vessels.

A statement follows, showing the number of vessels and number of tons on the register books at the different ports of registry in the Dominion, on the 31st December last, along with a comparative statement of the tonnage from 1874 to 1906. A statement is also published of the number of vessels built and registered in the Dominion during the last year, and a comparative statement of the number of new vessels built and registered from 1874 to 1906, both inclusive. A comparative statement is also given of the tonnage of the Maritime States of the world.

RAPPORT SUR LA MARINE MARCHANDE

A l'Honorable L. P. BRODEUR,
Ministre de la Marine et des Pêcheries.

MONSIEUR,—J'ai l'honneur de présenter la seizième liste de la marine publiée par ce département, étant une liste de vaisseaux dont les noms sont inscrits sur les registres de la Puissance du Canada au 31 décembre 1906, donnant le nom de chaque vaisseau, son numéro officiel, le port où il fut enregistré, son grément, l'année de sa construction, ses dimensions enregistrées et son tonnage enregistré. La liste, dans le cas des vaisseaux mûs par la vapeur, indique le tonnage brut ainsi que le tonnage enregistré de chaque vaisseau. La liste donne aussi le nom et l'adresse du propriétaire de chaque navire, mais dans les cas où il y a plus d'un propriétaire, le nom et l'adresse du propriétaire gérant sont donnés s'ils sont connus.

Le nombre total des navires inscrits sur les registres du Canada, au 31 décembre 1906, comprenant les vieux et les neufs, les voiliers, les navires à vapeur et les barges, était de 7,512 d'un tonnage de 654,179 tonneaux enregistrés, ce qui forme une augmentation de 187 vaisseaux et une diminution de 15,646 tonneaux enregistrés pour l'année 1906 par rapport à 1905. Le nombre de navires à vapeur portés sur les registres à la même date était de 2,810, d'un tonnage brut de 375,263 tonneaux. En calculant sur le pied d'une moyenne de \$30 par tonneau, la valeur du tonnage enregistré au Canada le 31 décembre dernier serait de \$19,625,370.

Le nombre des navires construits et enregistrés au Canada, l'année dernière, a été de 397 de 21,741 tonneaux enregistrés. En estimant la valeur du nouveau tonnage à \$45 le tonneau, on a une valeur totale de \$978,345 pour les navires neufs.

On trouvera ci-joint un état indiquant le nombre de vaisseaux, le tonnage enregistré aux différents ports d'enregistrement du Canada, au 31 décembre dernier, avec un tableau comparatif du tonnage de 1874 à 1906. Un état est aussi publié donnant le nombre de vaisseaux construits et enregistrés au Canada l'année dernière et un tableau comparatif des vaisseaux construits et enregistrés de 1874 à 1906 inclusivement. Un tableau comparatif est aussi donné du tonnage des puissances maritimes de l'univers.

THIRTY-NINTH ANNUAL REPORT

OF THE

DEPARTMENT OF MARINE AND FISHERIES

1906

FISHERIES

PRINTED BY ORDER OF PARLIAMENT

O T T A W A

PRINTED BY S. E. DAWSON, PRINTER TO THE KING'S MOST
EXCELLENT MAJESTY

1906

*To His Excellency the Right Honourable SIR ALBERT HENRY GEORGE, EARL GREY,
Viscount Howick, Baron Grey of Howick, a Baronet, G.C.M.G., &c., &c., &c.,
Governor General of Canada.*

MAY IT PLEASE YOUR EXCELLENCY :

I have to honour to submit herewith, for the information of Your Excellency and the legislature of Canada, the Thirty-ninth Annual Report of the Department of Marine and Fisheries, Fisheries Branch.

I have the honour to be,

Your Excellency's most obedient servant,

L. P. BRODEUR,

Minister of Marine and Fisheries.

DEPARTMENT OF MARINE AND FISHERIES,

OTTAWA, October, 1906.

6-7 EDWARD VII., A. 1907

By the order appointing them they were empowered to hold conferences with the authorized United States representatives, in the state of Washington, with a view to reaching some common ground of action, and formulating some mutual fishing regulations for the contiguous Pacific waters of both countries. They were instructed to visit the centres of the salmon industry and the various fishing localities on both sides of the international line. They were also instructed to take evidence at public sittings in British Columbia and make such inquiries and investigations as appeared necessary in order to make such report and recommendations as would enable the Minister of Marine and Fisheries to submit to the government for sanction regulations which will best preserve, protect and develop the fishing industries of British Columbia.

When on June 6th, 1905, the late Minister of Marine and Fisheries (Hon. Raymond Préfontaine) informed the Hon. the Governor of Washington State, by letter, that a B.C. Fishery Commission was about to be appointed to thoroughly investigate the salmon and other fisheries of the Pacific waters of Canada, he called attention to the fact that 'the interest of the salmon fisheries of Washington State are bound up with those of the Fraser river, and adjacent waters of British Columbia' and it therefore appeared desirable that conferences or joint sittings should be held of the Canadian Commissioners and a commission representing the state of Washington. 'No doubt you are aware' added the late minister in his letter 'of the widespread feeling that some such mutual conferences should be held, with a view to the formulation of joint fishery regulations for the contiguous waters of the Straits of Georgia, Puget Sound, and the Strait of Juan de Fuca.' In his reply, dated Olympia, June 13th, 1905, the governor (the Hon. Albert E. Meade) stated that he would immediately appoint a commission 'consisting of the Fish and Game Commissioner of the state and three other gentlemen familiar with the fishing industry which commission will be pleased to sit with the Canadian Commission alone or in connection with commissioners named by other northern boundary States' and he promised to forward the names of the commissioners, when appointed, 'to the end that an immediate place and date of meeting may be arranged at the earliest possible moment.' Subsequently other commissioners were added making the total number seven, namely :—

- Mr. T. J. Gorman, Seattle, Chairman.
- Mr. E. B. Deming, Bellingham.
- Mr. J. C. Kerr, Seattle.
- Mr. E. E. Ainsworth, Seattle.
- Mr. Frank Wright, Bellingham.
- Mr. A. H. Woolard, Bellingham.
- Capt. Riesland, State Fish Commissioner.

The British Columbia Commission consists, it may be added of the following members :—

- Professor E. E. Prince F.R.S.C., F.L.S. &c., Ottawa, Chairman.
- Mr. Campbell Sweeny, Vancouver.
- Mr. John C. Brown, New Westminster.
- Mr. Richard Hall, M.P.P., Victoria.
- Rev. George W. Taylor, F.R.S.C., F.L.S., &c., Wellington.
- Mr. J. P. Babcock, Provincial Fishery Commissioner, Victoria.

SESSIONAL PAPER No. 22

The duties of Secretary of the Commission have been performed by Mr. J. Charles McIntosh, barrister-at-law, Victoria, B.C.

As empowered by the Order in Council (July 22, 1905) appointing them Commissioners, and as directed by the instructions appended to the said Order in Council, they have, in addition to sittings for the taking of evidence, and visits to the various fishing grounds in all parts of the coast, besides numerous private executive sittings, held 'conferences with United States' representatives in Washington State, and made visits to selected centres and to fishing grounds on both sides of the International Line.' At these conferences the Canadian Commissioners thoroughly and exhaustively discussed the question involved, so that the Canadian contentions were thoroughly elucidated.

To briefly summarize the commission's proceedings it may be stated that, after preliminary executive sitting in Victoria on Sept. 19th and 20th, 1905, and the appointment of committees, one to investigate the herring fishery, especially near Nanaimo, the other to inquire into and report upon suggested topographical limits to be defined for fishing salmon in the Fraser river, an adjournment was made until November. On Nov. 10th and 11th, 1905, the British Columbia Commissioners met the Washington Special Commission, in Seattle, and held a lengthy preliminary discussion on the more important points arising in connection with the sockeye fishery in the Fraser river and the contiguous waters of the Straits of Georgia, Puget Sound, and the Straits of Juan de Fuca.

As public sittings had, up to that period, not been held by the British Columbia Commissioners and no evidence had been taken, and as the Washington State representatives had not formulated their views or drawn up any suggestions for a code of mutual fishery regulations; it was agreed to adjourn to meet at some future convenient date, with the understanding that statistical and other information should be prepared by both commissions, and certain reports and documents mutually furnished by one commission to the other.

At the conclusion of the Seattle Conference, the chairman of the Washington Special Commission (Mr. T. J. Gorman) said. 'We believe that a great deal of good has been accomplished in the meetings. We feel with the provisions made for data to be furnished at the future conference to be held, that we can without difficulty arrive at a satisfactory conclusion in regard to the matters in which we are all so much interested.'

Further executive sessions were held in November, as well as public sessions at which 112 witnesses were heard and a large mass of valuable testimony was received.

The adjourned sittings were resumed in Vancouver on June 20, when arrangements were completed for making a tour of the United States traps and canneries in Puget Sound and the trap-nets in British Columbia waters west of Discovery Island, near Victoria. This tour in company with the members of the Washington Special Fishery Commission, from Bellingham to Anacortes, and by Rosario straits to Point Roberts and Blaine, yielded much valuable information, and the visit immediately thereafter to the British Columbia traps in Fuca straits put the British Columbia commission in possession of the actual facts relating to the fishing localities and fishing operations. During this tour it was arranged that the further proposed international

6-7 EDWARD VII., A. 1907

conference should be held in Vancouver on September 19. At this conference, in the Board of Trade rooms, Vancouver, the members of the British Columbia commission made a formulated statement of views and recommendations which a majority of the commissioners felt prepared to adopt, providing that Washington special Fishery Commission had some adequate recommendations to make to the Washington State legislature with a view to the mutual preservation of the sockeye salmon supply in contiguous waters. The main contention of the Washington State representatives was that a weekly close time for sockeyes of 36 hours in their waters is rendered ineffective, owing to the alleged excessive gill-netting carried on in the Fraser river above New Westminster Bridge (that is to say, between New Westminster Bridge and Mission Bridge, a distance of 38 miles). The Washington special Fishery Commission stated their willingness, as far as they are able, to secure the continuance of the 36 hours close time, each week, in their waters, if all gill-netting for sockeyes be prohibited in the Fraser river, between the two bridges named. Such a prohibition, it is contended, would ensure the preservation, and possibly, the increase of the supply of sockeye salmon in the Fraser river. At this second international conference held on September 19, in the Board of Trade rooms, Vancouver, a final interchange of views took place with the result that mutual conclusions were arrived at. These conclusions of the Washington State commission will be embodied in their report which, it is expected, will be laid before the State legislature when it assembles in Olympia about the middle of December. The recommendation of the British Columbia Fishery commission are tabulated in an interim report forwarded to Ottawa early in October. It includes a minority report on points upon which the commission was unable to come to a unanimous decision.

A considerable amount of work still remains for the British Columbia Commissioners to complete ; but it is possible that a full and final report including a revised code of suggested fishery regulations for the province of British Columbia will be prepared during the winter and after full discussion will be presented in due course, when the work of the commission will then come to an end.

GEORGIAN BAY FISHERY COMMISSION.

During the year 1906 the further sittings of the commission, referred to in last year's report, have been held, two of the commissioners (Mr. John Birnie, K.C., and Mr. J.J. Noble) carrying on the work most assiduously in spite of the absence of the chairman (Professor Prince) who was closely engaged with important fishery duties on the Pacific coast.

In February, Mr. Birnie attended in Ottawa and, with Professor Prince, reviewed most of the evidence with a view to the compilation of an Interim Report, and later Mr. Noble also discussed in the office of the Commissioner of Fisheries, some of the more salient points.

On March 13th, the commission met in Toronto and took a large amount of important evidence largely referring to the decrease in the game fish of Georgian bay. At the second day's sitting on March 14th, still further evidence was taken, and after a third sitting on March 15th, the commission adjourned to meet in Collingwood on the 17th and 19th of March. Unfortunately, owing to serious indisposition, Mr. Noble was not present at the Toronto or Collingwood sittings. Later in the year the com-

SESSIONAL PAPER No. 22

missioners, with the exception of the chairman, continued their tour of the Georgian bay fishing localities, and took evidence from Midland on July 24th, to Kagawong early in September. There still remain to be visited Spanish river, Cutler, Algoma Mills, Blind river, Thessalon, and Sault St. Marie, and strong representations have been made that evidence should be heard from fishermen further south including Windsor, and other St. Clair and Detroit river points. The commissioners feel that, in order to satisfactorily settle the very important questions which have been laid before them by the fishermen, fish-merchants, anglers and others, they will require to extend their investigations. They will thus be enabled to present a far more satisfactory and conclusive report, and make recommendations likely to assist the Hon. the Minister in his decision upon the matters in controversy.

MARINE BIOLOGICAL STATION.

The Marine Biological Station has passed a second year at Gaspé and has continued the important fishery investigations commenced in 1905.

Dr. Stafford again acted as curator and pursued his researches into vertebrate and invertebrate life in the waters off Gaspé. He will add considerably to his faunistic results, and as these afford insight into the nature and location of the food, which attracts the marketable fishes to their recognized haunts, interesting reports will be made in due course. Professor Knight, who has made so many contributions to fishery knowledge of the highest practical importance, carried on some experiments as to the comparative merits of frozen and of fresh bait. The conclusions, drawn from these experiments, will be published, and will be of unique interest, as the matter is one upon which the opinions of practical men all along the Atlantic coast are divided. Amongst the staff of workers, were several distinguished students and assistants from McGill, Toronto, and other universities.

The question of deciding upon a permanent site for the Biological Station was discussed at the meetings of the board of management in Ottawa in January and in May and a committee was appointed to examine a number of localities in the maritime provinces and report to the next board meeting.

The suggestion for a British Columbia Biological Station, at some suitable place on Vancouver Island has been before the board, and was urged by the Rev. G. W. Taylor F.R.S.C., of Wellington, near Nanaimo. Inasmuch as United States scientific men have actively carried on investigations in the Pacific waters of Canada, and one United States Marine Station has been equipped and has been in operation on the west coast of Vancouver Island, the urgency of immediately commencing Canadian biological investigations in these prolific and unparalleled waters is recognized. The British Columbia Fishery Commission have, it is understood, strongly pressed the matter, and steps should be taken without delay to equip a small station and commence fishery researches early next season. Professor Prince and Rev. Mr. Taylor did some work, under the British Columbia Commission, with most fruitful results.

GEORGIAN BAY BIOLOGICAL STATION.

The staff of this Station, under the skilled guidance of Dr. B. Arthur Bensley has actively carried on its work as in previous seasons. Reports are in preparation, which

6-7 EDWARD VII., A. 1907

will probably be published with the fishery investigation results of the Marine Biological station. The Georgian Bay Commission have not been able to formulate the special researches, which in their opinion would aid them in deciding crucial matters in the waters of Western Ontario. Next season these definite problems will be laid before the staff of the station, and their solution will no doubt follow the exact scientific study which the staff will be able to bestow upon them.

Professor Knight and Professor Prince had arranged to visit the station during the season, under authority of the Biological Board; but the visit was not possible.

The fine collection of fish specimens formed at the station has been greatly added to, but, for details of the researches reference must be made to the forth coming reports now in preparation.

SCOTCH HERRING CURING EXPERIMENT.

Reference to this important innovation in the Canadian herring industry, will be found in the thirty-seventh annual Department Report, Fisheries, 1904, page lxxxiii, and in the thirty-eighth annual report, Fisheries, pp. xxvii. and cviii.

This experiment has been conducted under the auspices of the department in charge of Mr. J. J. Cowie, of Lossiemouth, Scotland, an expert Scottish fish curer, thoroughly versed in the methods and trade connections, for the past three years.

The facilities provided embrace an up to date steam drifter, built in Great Britain, and brought across the ocean by the department; gangs of Scotch drift nets, three fishermen, one cooper and six girls. Also imported barrels and salt necessary for the success of the venture in its entirety.

During the first season 1904, the operations were carried on with Canso, Nova Scotia, as a base, both in the spring and fall fishery, and proved in every way satisfactory as demonstrating that the Canadian herring was capable of the same treatment as the Scotch herring; that the fish itself is equal, if not superior, to those on the other side of the Atlantic, and that the product of the experiment so treated was capable of realizing prices equal to those of the Scotch article in the markets of United States and Russia.

During the year 1904, after the Atlantic herring season terminated, Mr. Cowie, with a portion of his staff, proceeded to Nanaimo, British Columbia, where he demonstrated to those interested in the business on the Pacific coast, the Scottish methods as applicable to the conditions obtaining there.

For the season of 1905, Mr. Cowie's operations so far as the spring fishery was concerned were repeated at Canso, but the fall fishery branch of the experiment was conducted at Yarmouth, and Clarke's Harbour, Shelburne County; the details of which are described in the Departmental Report of Fisheries for that year. As in the previous year, his field of operations was again removed in the fall to the Pacific Coast.

This season, the efforts of the Department in this respect, have been confined to the Bay des Chaleurs, where the full season, embracing both spring and fall branches, has been carried on with Caraquet, N.B., as a base of operations.

SESSIONAL PAPER No. 22

It may be said that hitherto the spring run of herring in these waters has been of no commercial value to the fishermen and handlers of herring, inasmuch as no concerted attempts have been made, since the termination of the fishery articles of the Treaty of Washington, to utilize this branch of the herring fishery in a legitimate business way. The herring at that season having been regarded as of no particular value, such as were taken were devoted principally if not wholly to the fertilization of the land by the local farmers.

The feasibility of the utilization of these fish at highly remunerative prices, has created a most favourable impression among the fishermen on both sides of the Bay des Chaleurs, and their eyes have been opened to great future possibilities in this direction, and good results are expected to accrue immediately. Not only has it been demonstrated that a highly remunerative branch of the fishery has been wholly neglected, but it has been shown that the methods hitherto adopted in the prosecution of the fishery, irrespective of the handling and curing of the fish, have been primitive and only partial in its character. The efforts made by the local fishermen have been confined principally to inshore or local operations, the failure of which having been sufficient to convince the operators of the absence of fish, engendering a corresponding lassitude in their attempts at exploitation.

The spectacle, however, of the Department's steam drifter starting out in the evening to fishing grounds any distance up to 80 miles or so off shore, and returning the following forenoon with a substantial catch of fish, has awakened the fishermen to the fact that the fish are to be found offshore in localities where they have previously not been sought by their methods, although perhaps not to be encountered inshore where their operations have been confined. The Department having decided upon the Bay des Chaleurs as the base of the year's work, in order that nothing should be left undone to make the experiment complete in all its branches. Mr. Cowie and his staff arrived in the county in time to make arrangement for the earliest catches, and the steam drifter which had to winter at Canso, reached the Bay des Chaleurs on the 28th April, but owing to the prevalence of ice, it was found impossible to enter Caraquet Harbour until the 1st May, but fishing operations were further prevented by ice until the 8th of that month.

The staff consisted of a crew of eight men for fishing operations on the steamer, and six girls and one cooper for curing and packing on shore.

The first catch of herring was landed on the 9th May, and from that date forward the spring fishery continued more or less regularly until the 14th June.

The quantity of spring fish taken to that date being 504 barrels and these contrary to the expectations of the local fishermen were taken in deep waters all over the bay, showing the bay to be full of fish.

The spring fish were found to be in good condition up to the middle of May, full of milt and roe and pronounced by Mr. Cowie to be quite equal to the "full" fish taken on the east coasts of England and Scotland.

About that date spawning takes place after which the spring herrings become thin which deterioration renders them practically useless for pickling according to the

6-7 EDWARD VII., A. 1907

Scottish standard, so that of the spring catch, not more than 240 barrels were curable, the balance being taken into the local fishermen's bait freezers, for baiting purposes.

In the beginning of July, while fishing about 40 miles from Miscou Point, and about 25 miles from Gaspé coast, the steamer came upon some fine large fat "Matjes" of which 58 barrels were landed. The "Matje" it may be here explained is a herring without roe or milt, but fat and well flavoured; in other words, herring which having already shed their spawn, and passed their sick period are feeding and fattening before again filling up with roe or milt. Such fish are cured by a process, which contemplates their immediate consumption during the summer months.

During the remainder of July the herring appeared to be scarce.

On August 8, the first of what is known as the 'fall' run of herring was struck in the Gulf about 12 miles from Miscou, and were caught there in quantities varying from 10 to 16 barrels until about the end of the month, when fish appeared inside the bay and some were taken there up to about the end of September.

For a few nights fair quantities were taken by a fleet of 60 local boats on the inshore grounds. These finished fishing, however, about the first or second week in September, their average catch being about 20 to 30 barrel of fall fish.

The steam drifter ceased operations having caught 272 barrels of fall fish, the whole of which were curable.

Mr. Cowie remarks that the fall catch of the Bay des Chaleurs is comprised of the largest and fattest herring that he has ever seen, and nowhere around the British Isles are herring caught to equal them.

During the month of May visits were made to Bonaventure and Gaspé Counties, where demonstrations in curing were given, the fishermen and others evincing the liveliest interest in the work and apparently appreciating the possibilities of a new industry along these educational lines.

One Caraquet firm has made a start to cure in the Scotch style employing local girls and having the fish cured on shore in uniform barrels, while others on both sides of the bay are said to be making arrangements for taking advantage of the plentiful spring run of herring next year. To secure the largest quantities of curable spring herring before they have spawned, the fishery ought to begin about April 20, when a full month's fishing of good marketable fish could be secured. At some places on the south shore of the bay the presence of ice would probably prevent so early a start, but the experience of this year is that a sufficiently early beginning could be made on the north shore, where the ice leaves earlier, permitting of full advantage being taken of the spring fishery at its best stage.

This part of the coast, Mr. Cowie believes to be a never failing resort of herring in the spring and fall with the seasons fairly well defined, he considers that a regular herring, curing and exporting business could be built up there similar to that in Scotland.

With only one boat drifting in this extensive area, the chances of striking the schools of fish are comparatively very small, nevertheless what the steamer has done

SESSIONAL PAPER No. 22

this year, has caused the fishermen of the bay to recognize the advantages of drift net fishing, and that with their own boats fitted for drifting with a fleet of about fifteen nets, herring in quantities could be caught in the deep water, long before they reach the inshore areas, and when they are in the best condition, especially in the fall.

It is interesting to note that towards the end of July, mackerel appeared to be plentiful, about 5,000 being caught by the drifter, which would seem to indicate the possibility of a lucrative mackerel fishery by drift nets in the bay.

The spring fish and 'Matjes' are now in the New York market, and advices of their sale and prices realized have not yet been received.

The fall fish and mackerel are being got ready for shipment.

At the beginning of the present season, the department published a fisheries bulletin, embracing full instructions for the curing and packing of 'Full' and 'Matje' herring, and the construction of barrels in the Scottish method as applicable to the Atlantic provinces of Canada, which will be embraced in Mr. Cowie's report of the season's operations appearing in the supplement to this report.

FISH BREEDING.

The Commissioner of Fisheries presents his annual report on fish culture, and the details covering the past season's operations as conducted at the various fish breeding establishments by this department are included in the reports of the officers connected with this service, and form Appendix No. 11, of this report.

Several new establishments have been operated for the first time and the uniform success of the season's work is a matter of congratulation to all connected with this important branch of the service.

The distribution of the large numbers of young fish from the thirty-two hatcheries now in operation throughout the Dominion is a serious and in many cases very expensive matter. Under the present system of stocking by application, long distances have to be covered by rail and team, and it often occurs that difficult portages are involved. Reference was made in last year's report to the system of stocking by localities and whilst this suggestion has been carried out wherever possible, it is a system that might well be adopted by the department on a more extensive scale.

The rearing-ponds at Lake Lester and the Black Bass ponds on the Bay of Quinte have been operated successfully and the lobster ponds at Fourchu, N. S., under the supervision of Mr. H. E. Baker have again resulted in a successful season's work.

OYSTER CULTURE.

The report of the Department's Oyster Expert for the season of 1906 forms Annex C. to Appendix 11 of this report. Mr. Kemp divided his time between the oyster beds of Prince Edward Island and those of Shediac, N. B.

This officer ends his report with a few extracts from a lecture given by him on the subject of private cultivation of oysters. While briefly stating what has been done in other countries, he surmises what could be performed at home.

GENERAL STATISTICS *RE* FISHERIES.

EXTENT OF COAST.

The fisheries of Canada are the most extensive in the world, extending over our immense sea-coast line, besides our innumerable lakes and rivers.

The Eastern sea coast of the maritime provinces from the Bay of Fundy to the Straits of Belle Isle covers a distance of 5,600 miles, which is more than double that of Great Britain and Ireland.

While the salt water inshore area, not including minor indentations, covers more than fifteen hundred square miles, the fresh water area of that part of the great lakes belonging to Canada is computed at 72,700 square miles, not including the numerous lakes in Manitoba and other western districts all stocked with excellent species of food fish.

FISHERIES EXPENDITURE AND REVENUE.

The statement of the total expenditure for the different services connected with the fisheries of Canada during the last fiscal year will be found in Appendix No. 13 of this report.

The total fisheries expenditure amounts to \$968,722 subdivided as follows :

Fisheries proper \$155,929, fish culture \$209,376, fisheries protection service \$249,876, miscellaneous expenditure \$194,994, including also \$158,546 distributed as fishing bounties.

The net total amount received as revenue from fishing licenses, fines, &c., during the same period in the different provinces of Canada, is given as \$98,009. This sum also includes \$14,568 received from the United States fishing fleet as *modus vivendi* license fees.

A comparative statement of all the fisheries expenditure and revenue for the last fifteen years concludes this appendix.

For fuller details of these different fishery expenditures, see Auditor General's Report under their several headings.

BOUNTIES FOR FISHING.

The deep-sea fishermen of the maritime provinces received the sum of \$158,546 as bounties on their respective catches of fish. for the season of 1905.

Of this amount, the owners of 922 fishing vessels and their crews received \$71,502. The balance \$87,044 was distributed amongst 20,501 boat fishermen.

For the past season the province of Nova Scotia received nearly double the amount of bounty paid to the other three provinces, viz. :—\$100,664 ; Quebec, \$34,185 ; New Brunswick, \$15,379, and Prince Edward Island, \$8,317.

SESSIONAL PAPER No. 22

Since its inception (1882) the sum of \$3,790,685 has been distributed amongst the fishermen of the above named provinces to enable them to better develop their industry.

The regulations governing the payment of such fishing bounties as well as all particulars respecting their distribution form the first appendix of this report.

VALUE OF THE FISHERIES OF CANADA.

The whole catch of fish in our waters by Canadians, including fish products, seals, &c., during the season of 1905, aggregates the large sum of nearly *twenty nine and a half million dollars*; nearly as much as the total production of both gold and coal in the Dominion, during the same period.

It is a record breaking season, exceeding by over four million dollars the large output of 1901, and by over six million dollars the yield of the previous year, which was considered a very good season.

A glance at the following statements will easily demonstrate where this enormous surplus comes from. The province of British Columbia alone shows the vast increase of over four and a half million dollars.

For the first time in the history of our record, has Nova Scotia been superseded as the banner fish producing province of Canada. Although it shows an increase of nearly one million dollars over the yield of 1904, yet the Pacific province heads the list by \$1,600,000.

The following table shows the total value of the fisheries of each province in their respective order of rank with their increases or decreases as compared with 1904:

Provinces.	Value of Fish.	Increase.	Decrease.
	\$	\$	\$
British Columbia.....	9,850,216	4,631,109
Nova Scotia.....	8,259,085	971,986
New Brunswick.....	4,847,090	176,006
Quebec.....	2,003,716	252,319
Ontario.....	1,708,963	84,266
P. E. Island.....	998,922	78,624
Manitoba.....	1,811,570	94,593
Saskatchewan.....			
Alberta.....			
Totals.....	29,479,562	6,126,013	162,890
Net increase.....	5,963,123

With the exception of Prince Edward Island, showing a slight diminution, the other maritime provinces all show substantial improvement as compared with the yield of fish of the previous season.

In fact, the two large increases indicated above come from the extremes of the Dominion separated by three thousand miles, thus proving the immense area from which our piscine wealth is derived.

6-7 EDWARD VII., A. 1907

While the inland waters of the these western or central provinces show an increase of nearly \$100,000, consisting chiefly of whitefish pickerel and pike, Ontario has a falling off of about an equal amount.

Notwithstanding the large estimates of fish for domestic consumption in British Columbia, it is said to be far under the immense quantities used by the Indian population of that province as well as that of the Yukon district and other remote parts of the Territories where fish food is a staple article.

The various features in the fisheries of each province are fully explained by our different inspectors in their respective reports, forming appendices from two to ten of this publication, as well as in their preliminary reports herewith.

The following statement shows the relative values of the principal kinds of the commercial fishes (above \$100,000) for the year 1905 as compared with those of the previous year.

Kinds of Fish.	Value.	Increase.	Decrease.
	\$	\$	\$
Salmon	8,989,942	5,120,397	
Lobsters	3,906,998	215,847	
Cod	3,421,400		222,254
Herring	2,303,485	146,996	
Whitefish	1,051,161		7,651
Mackerel	958,223	207,826	
Sardines	878,372	87,931	
Haddock	806,743	167,770	
Pickerel	784,988	146,421	
Trout	735,768		46,372
Halibut	616,735		167,829
Hake	447,665	84,531	
Smelts	433,147		14,432
Pollock	323,032	87,214	
Clams	239,851	54,513	
Pike	227,064		25,789
Sturgeon	198,778		42,932
Oysters	174,300		12,385
E-ls	127,708		2,236
Alewives	121,640		33,976

The quantity of fish used as bait in the season of 1905 is valued at \$455,900, and that of fish oil at \$259,480.

The fur seal skins secured by the British Columbia hunters during the same period realized \$331,152.

In past years, there seemed to have been an apparent struggle between salmon, lobster and cod for first place, but a glance at the above list shows the largest fluctuation ever recorded in our fishery statistics. Owing to the phenomenal catch of salmon in the British Columbia waters, that king fish not only heads the list with an aggregate value of nearly nine million dollars, exceeding the previous output by over five million dollars, but beating the famous record of 1901 by over one million dollars. This year the value of the salmon industry equals the combined productions of lobsters, cod and herring together. While the capture of salmon was considerable in the maritime provinces, the above mentioned extraordinary result is chiefly attributed to the enormous yield of

SESSIONAL PAPER No. 22

British Columbia, whose fishermen were expecting a big run, as it was a fourth year and they were not disappointed. At times, the run was so large that canners had to limit the boats to 200 fish each per day, not being able to handle more. The quantity of salmon salted or disposed fresh was also larger than usual. Altogether, no less than eighty one million pounds of salmon were contributed to the industry by the western province during last season.

Not only did the lobster industry again hold its own, but the season of 1905 shows an improvement of nearly a quarter of a million dollars over that of 1904.

This, however, must be ascribed to more remunerative prices received, especially for live lobsters shipped to Boston and neighbouring markets, as the pack of last season was less than the previous one, being given at about ten million and a half lb. cans, while there was 43,000 cwt. more of crustaceans disposed of in the shell than in 1904.

Lobsters were reported more plentiful in the waters in the proximity of the hatcheries of a few years' existence, but they were of a smaller size.

Of the twenty species whose value exceed the \$100,000, the two most noticeable shortages are in cod and halibut, while the others are of minor importance. The other branch of the cod family as haddock, hake and pollock show fair improvement. Mackerel and herring also yielded much in excess of the previous season.

Of the fresh water species, pickerel alone shows a surplus yield, while whitefish, trout, pike and sturgeon have fallen off.

From the year 1869 to 1905 inclusive, the five principal commercial sea fishes have yielded the following values to the industry :

Cod	\$136,043,567
Salmon	90,933,459
Lobsters	79,868,626
Herring ..	72,565,569
Mackerel ..	46,047,244

EXPORT OF FISH.

During the last fiscal year, the fish and fish products including marine animals exported from Canada to foreign countries, chiefly to the United States and Great Britain, amounted to \$16,040,000, being an increase of over five million dollars over the previous export. This surplus export corresponds well with the increased production.

6-7 EDWARD VII., A. 1907

RECAPITULATION.

Of the Yield and Value of the Fisheries of the Dominion of Canada for the Year 1905.

Number.	Kinds of Fish.	Quantity.	Value.	Total.
			\$	\$

SESSIONAL PAPER No. 22

CAPITAL INVESTED IN THE FISHING INDUSTRY OF CANADA, FOR THE YEAR 1905.

Number of Persons Employed.

During the season of 1905, no less than 82,870 fishermen were engaged in the Canadian fisheries, exclusive of the thousands employed in the lobster packing industry.

While 9,366 sailors manned the 1,384 fishing crafts, no less than 73,500 fishermen used 41,463 boats for the same purpose. Altogether, nearly seven million fathoms of nets were used with many other fishing implements aggregating a capital of nearly thirteen million dollars, that is over half a million more than the previous outlay.

The lobster plant alone is estimated at \$1,426,300, comprising the equipment of 723 canneries, dispersed on the coast of the maritime provinces. Of these establishments, Nova Scotia operated 237, New Brunswick 198, Prince Edward Island 196 and Quebec 92. Besides the packing industry, the shipping of these crustaceans alive or fresh to the New England markets has developed large proportions. For those suitably located, the latter branch of the lobster industry is the more remunerative. Over 14,000 persons found profitable employment in these different establishments, which put on the market about 10½ million lb. of the preserved article, valued at \$2,624,400. Including the fresh lobsters, the whole output aggregates a value of \$3,907,000, the second of importance on the list of commercial value.

The salmon industry of British Columbia has, in 1905, surpassed any previous record of yield or value in that province. Over eighty million pounds of that fish were put on the market, prepared in different ways as commerce required. Over 17,250 persons found employment in that branch of the fishing industry. These fishermen used about 4,800 fishing boats with over 800,000 fathoms of gill-nets, together valued at over \$800,000.

Not including the sealing fleet, (which is still valued at \$393,600) the remaining capital invested in canning and other branches of the fisheries industry of this Pacific province is computed at \$2,764,545.

Only eighteen of the sealing fleet were hunting seals during the season of 1905. They were manned by 188 white men and 309 Indians. One vessel was lost at sea with its whole crew. The other vessels secured an average of 626 skins each. The skins realized \$24 each, an aggregate of \$331,150.

FISHING SEASON OF 1906.

PRELIMINARY REPORTS OF THE INSPECTORS OF FISHERIES IN THEIR RESPECTIVE DISTRICTS.

GENERAL REMARKS.

As the fishery statistics published every year are always a few months old, it has been customary to request all our inspectors of fisheries to briefly summarize the prospects of the current fishing operations as well. This year, owing to an early session of parliament and consequent early preparation of our report, the usual request comes to them three months before the end of the season, hence their data cannot be expected to be as reliable as formerly. However, a glance at the following reports from the different parts of the Dominion will give interested parties a fair idea of coming results.

From a point of view of establishing comparisons, it is almost regrettable that the total value of the 1905 fisheries, just published, soared so high above all previous records, as no doubt, it will be years again before such an aggregate is reached permanently. (*Nearly thirty million dollars*).

While to the phenomenal pack of sockeye salmon was due the enormous surplus of last year, to the shortage of the same British Columbia industry may be ascribed the large decrease in perspective for the current season.

The other branches of the fishing industry there, will be as good, in fact, halibut is reported even better than in 1905. The same may be said of the herring business which is extending in different branches.

The whaling station in Barclay Sound will prove a successful venture.

In the maritime provinces one fluctuation will make up for another, and the general result will be as satisfactory as in 1905. Salmon seem to have been plentiful almost on every part of the coast. The yield of the cod family will also generally prove as productive as the previous one. Prices for this staple article continued to be remunerative, much above the rates adopted for our statistical statements. The lobster industry will fall short of 1905, especially in Cape Breton, but in the Northumberland straits the packing will be as large as ever. Herring, especially for sardine purposes, was almost a failure in the Bay of Fundy. This will make a big contrast coming after the large catch of last year.

Dogfish has not yet abandoned its usual summer resorts, although they were less numerous than in former seasons.

The above remarks in the maritime provinces might embrace the gulf division of Quebec, where nearly all kinds of fishing are reported fairly satisfactory, excepting perhaps the lobster industry. Salmon and cod were abundant, some of the latter were reported caught as far up as Rimouski, quite an unusual event.

SESSIONAL PAPER No. 22

It is hoped that the inland western waters east of the rockies will at least maintain an equal production to that of the past few years. As civilization advances in the west there is more demand for fish food. With proper protection and due limitation to real domestic fishing, these waters might supply such food for years to come. With increased means of transportation, the temptation for commercial ventures will exist in fishing as in other pursuits.

NOVA SCOTIA.

Inspector A. C. Bertram, of Cape Breton, says that while some of the commercial branches have been exceptionally poor, others will yield an average, and that of salmon more than the previous one.

Taking the whole industry, the result of this year's operations will be a considerable decrease in the total value.

The lobster fishery, the first branch of the fishery prosecuted in the season, and an important one, not only to fishermen, but to others employed in canneries, was a failure this summer. The spring herring fishery, an important fishery also, as spring herring are used largely for bait by not only local fishermen, but foreigners as well, was below the average.

The cod fishery gave good results early in the season, but after the arrival of dog-fish early in July and scarcity of bait, this branch of the fishery became so discouraging to fishermen that hundreds of young men abandoned fishing and left their homes for either Western Canada, the coal mining districts of Cape Breton, or the Maine (U.S.) woods.

The salmon fishery was unusually good, particularly in the Northern waters of the county of Inverness. Besides exceptionally good salmon net fishing, the principal rivers became well supplied, and in the famous Margaree, anglers have done better than in any of the past twenty years.

Fishermen are preparing to vigorously prosecute the fall mackerel fishery, and more especially the fishermen of Inverness County. About the third week of September, mackerel appeared in large numbers, and some boats have already done well. Last fall the mackerel schools passed from the north bay southward on the northern part of the island through the Strait of Canso, instead of as formerly on the eastern side of the island. The result was immense catches by the fishermen of Inverness, and a poor mackerel fishery by the fishermen on the south eastern side of the island.

Although the fishery for this year has not been good, there will be little or no distress during the coming winter, on account of the excellent crops of this year.

Inspector R. Hockin of District No. 2, N.S., reports as follows:—From the reports received from the local officers it is estimated that the total yield will fall short of that of last year—about fifteen per cent.

The returns from the cod, haddock, hake and pollock fisheries are expected to be considerably short of last year.

6-7 EDWARD VII., A. 1907

The yield of the halibut fishery will be nearly the same, and the same may be said of the mackerel.

The herring, however, have been in abundance, and more have been taken than for several years.

The lobster fishery will yield about 10 per cent short of last year, partly owing to boisterous weather on the Atlantic coast during the fishery season.

Salmon will show a larger catch than for many years.

More shad have been taken this year than for a number of years.

The gaspereau fishery on the Atlantic coast has been almost a total failure. In the Bay of Fundy some have been taken but much less than the average.

The dogfish were not in abundance at the first of the season, but lately have been numerous and are seriously retarding the efforts of the fishermen.

NEW BRUNSWICK.

Inspector J. H. Pratt, N.B., says :—The catch of herring has not been so small for a great many years, more especially the smaller size for sardine purposes. On account of this unusual scarcity, and the sardine market being glutted with the manufactured article from last season's pack, the prices received by our weir owners never exceeded \$4 per hogshead and in many cases, much less. Large herring do not come early in the season as a rule, but there are good signs of this fish striking in shore soon and there is a clear market awaiting them with good prices.

Dogfish have been as destructive as in past seasons, causing the usual heavy loss to the fishermen's gear, but, in the past few weeks they are reported as decreasing in numbers.

Cod and haddock will show fully their usual catch with probably an increase on account of so many disappointed weir fishermen having been compelled to resume hand-lining for a living. Pollock fishing has been up to the average, especially the Quoddy river fishery, which compensated the fishermen to a large extent for the decreased sardine fishery.

Several of the weirs at Campobello made large catches of pollock besides their usual herring catch, causing the envy of those who make their hauls by the more laborious process of the hand lines.

The catch of salmon in the Bay of Fundy was an extremely good one, fully equal to that of 1905.

Dynamiting among the pollock schools has been practiced very largely all summer by the fishermen of Eastport, Maine, and on numerous occasions they came over among the pollock schools in Canadian waters with their explosives.

The lobster catch will show about the same as last season, with prices good. The same number of factories were in operation, and their pack was about the same as that of 1905.

SESSIONAL PAPER No. 22

Inspector R. A. Chapman, of N. B., says :—More shads have been caught than for past few years.

Salmon have been more plentiful in the aggregate than for several seasons past, and they are yet seen by our guardians in great numbers on all the streams which bespeaks for another large catch next year.

Spring herring were as plentiful as ever and the fall run on the Caraquet Miscou banks of unusually fine fat fish is now reported.

The catch of codfish will be considerably larger than that of last year notwithstanding a great scarcity of bait.

Fully as many smelts were caught as in previous year and they were of very much better quality.

Considerably more mackerel were taken this year than last.

It is too early yet to say much about oysters.

While somewhat less lobsters were canned in the northern part of the district than in 1905, on our side of the straits, in Westmorland and Kent counties, more have been taken than for many years. In fact, the catch was so large during last three weeks of fishing that much difficulty was found in getting help to pack them, many of the packers and fishermen in the northern part of the province propose to fish only in the spring and fall, and allow no fishing during the summer months when they are spawning. If something of this kind could be done, I do not believe they ever could be fished out.

The whole aggregate catch of fish will be considerably above that of 1905, and prices being high will make it an exceptionally good year for the fishermen.

Inspector H. E. Harrison, of Fredericton, says :—The inland fisheries of New Brunswick, taken collectively, have not given as good returns as previously. It is difficult to give any explanations for these conditions, other than it seems to be an 'off year' with most of the fish caught for market, particularly salmon. It is still harder to explain these conditions, regarding the upper part of the St. John and tributaries when salmon have been plentiful in the harbour and adjacent waters. The early spring reports were favourable to salmon fishermen but it did not last long, and with few exceptions, those following that particular line, the returns were not satisfactory. Not only was this the case with net fishermen but angling was very much below the average on the Tobique river where most of the fly fishing of my district is carried on. It is reported that there is now a good run of salmon in York County waters.

The quantity of shad taken this season was considerably below that of 1905. There is a possibility that this fishery is being carried on too extensively for the future good supply of this most valuable fish. Like conditions prevailed regarding alewives, but while it is possible that shad are being over-fished I do not think this is the case with alewives. However, it would be premature to form a decided opinion on one or even two years' results. These fish were in large demand and I think fishermen were fully compensated.

I look for an enlarged catch of sturgeon again this season. I am decidedly of the opinion that greater restrictions are necessary, if total depletion of these valuable fish is not the result in the very near future.

6-7 EDWARD VII., A. 1907

Trout fishing is reported extra good in some parts of the district and only fair in others.

P. E. ISLAND.

Inspector J. A. Matheson of P. E. I. says:—The lobster fisheries show a small increase over last year, notwithstanding that the stormy weather particularly, on the north side of the island, interfered a good deal with that section.

Cod fishery commenced well in the early part of the season but fell off later, and will show a decrease from 1905.

Hake has been plentiful particularly in King's county and continued well up to the first of September, when the dogfish appeared in great swarms on our coast, and destroyed this fishing. The outlook for fall fishing is not very bright, this fishing will show an increase over last year.

Mackerel will show a slight increase over last year. The season opened with a large run of this fish and was then followed by some of smaller size during the season.

Smelts show a decrease from last year.

The quahaug industry has assumed large proportions in this province, and if properly protected will certainly be one of the best paying of our fisheries, and already this season, fifty thousand dollars worth were shipped from the province to the United States.

PROVINCE OF QUEBEC.

Dr. W. Wakeham.—Officer in charge of the Gulf division, reports that the final returns of the fisheries of the district will show a considerable increase over those of the two preceding years, all branches of fishery, with the exception of the Lobster fishery, having made good yields.

The season began early, the first fishery to open, that of the spring herring, was as abundant as ever at the Magdalen islands, part of the main school passed south of the islands, and struck the shore of Etang du Nord, so that there was, perhaps, not as large a catch as usual in Pleasant bay.

Summer herring, as has been the case for some seasons back, kept off shore in deep water. Small herring fish about five inches long, were abundant all about the coast, but the nets in general use had too large a mesh to capture them.

Cod were abundant all season, and the summer catch on the south shore has been good, at the time of writing the fall fishing is on, and the reports are every where favourable for a good fishing, as both cod, and bait are abundant, unfortunately for the fishery, many of the boats are ashore for the winter, and that one half the fishermen have left for the lumber camps. In spite of this the yield from the south coast fishing stations will be a good one. On the lower north coast, from Natashquan to Belle Isle, the fishing was a failure, as except at a few points, the Capelin school of cod kept off shore in June and July, on the upper north shore from Natashquan West, the fishery will be an average one.

SESSIONAL PAPER No. 22

The catch of salmon, both on the north and south shores, has been an abundant one, the best for many years.

The lobster pack will show a serious falling off, the returns are not all in, as lobster fishing is still going on at the Magdalen islands, but I do not expect that the final summing up of the statistics will give more than about two thirds of an average pack.

The spring *mackerel* fishing at the Magdalen islands was good. The fall fishery is still being made. A very abundant seal hunt was made at the Magdalen islands in March and April, the seals were driven in on the shore, and all hands, men, women and children participated in the hunt.

Dogfish were as usual of recent years, the cause of great annoyance and loss. They are now possibly out of the gulf.

The season was a fine one, very warm, and without storms.

Inspector Jos. Riendeau, of Montreal, says :—The yield of fish, in my district, this year will be inferior to last year's catch, by one-half. This is due to several causes. First, the effects of latter years' abuses begin to be felt. The big fish are gone ; only the new generation is left. This must be protected, if we want to avoid a complete ruin. I would mention, as an example, sturgeon three or four feet long, which were abundant eight or ten years ago. This was a valuable fish ; it is now replaced by small sturgeons, measuring from 12 to 15 inches. I have even seen some on the market only seven inches in length.

I may state the same thing about '*barbottes*' (bullheads). This fish is also *recherché*. We used to catch some of a remarkable size and supplied the New York markets with them. Those we catch to-day are only fry, as compared with the old time '*barbottes*'.

This may be said of all kinds of fish, frequenting our lakes and rivers.

Another cause for this decrease is the following : During spring time, when the water is high, the bays become larger, and the small rivers and rivulets rise ; that is the time fish choose for spawning, and they enter the bays or come up the rivers to deposit their eggs. Then inconsiderate fishermen lay their nets, or build dams, which destroy thousands of fish. In my opinion, severe laws should deal with such actions. This custom is followed especially in small bays south and north of Lake St. Pierre.

A third cause for this falling off is the number of licenses granted by the province of Quebec. It is too large, especially on the south shore, from Nicolet to Sorel islands, and from Champlain to Pointe du Lac, on both shores ; fishing tackle is seen everywhere, some of which extend from 200 to 500 yards. How can small fish be expected to escape such formidable tackle ? This seems impossible.

It is also regrettable that trout should constantly decrease, as it is a most exquisite and valuable fish. I think that this is due to the fact that the fishing season for trout is too long. Nobody should be allowed to fish trout *before June 15th or after September 1st*. Fishermen fishing for their own use, should throw back into the water every trout

which would not be of the length stipulated in the regulations. This fish should not be made a commercial one; I am speaking of speckled trout.

I also consider it my duty to protest against the use of small seines "à véron" or with minnows. This causes a large decrease in the catch of maskinongé, black bass, doré and trout. The results, this year, have been even worse than those of last year, which were not altogether very good.

*Inspector A. H. Belliveau, of Ottawa, says:—*That in most of the inland districts of the province of Quebec, fishing results will still be inferior to the small yield of 1905. Not only the fish are falling off in size, but the better grades, as maskinongé, bass and pickerel, are gradually disappearing from their former haunts. This diminution may be safely ascribed to indiscriminate netting in the past as well as to the prevalence of the small meshed implements.

Missisquoi bay held its own better than any other fishing ground in my district. Although the time allowed to fish is very limited, fishermen realized as much as in previous years. New York regulations somewhat hampered them, but other markets were soon found. The interested parties then contracted for their whole catch at a stated rate instead of risking the chances of a fluctuating market.

The few week's seining allowed there in the spring cannot be so injurious as claimed by the petitioners for the prohibition of all netting as fish seems yet far from being depleted. The whole catch consists more of coarse fish than *doré*.

In Richelieu river, fishing was not as good as formerly, and hoop net fishing did not pay so well. No seines at all were tolerated in that district this summer. The great Iberville eel-weir was again successfully operated, and even if Fulton market is closed to their owners, others as remunerative have been opened in the west.

In the Saguenay district, salmon was abundant and poachers were very active making a home provision and even selling a few to summer hotels.

In nearly all other parts of my extensive district, the fisheries will show a considerable decline.

To save complete depletion, some of the waters should be set apart, for a few years, for the natural propagation of fish, and other restrictions, as regulation of mesh, and a minimum size of all species of fish, it is advisable to protect, should be adopted without delay.

It is to be hoped that whatever is the result of the deliberations of the interprovincial conference, the fisheries will receive due consideration, and that the administration of its regulations will be simplified and improved instead of the confusion existing for the past years.

ONTARIO.

*Inspector J. M. Hurly, of Belleville, says:—*During the spring fishing season at which time the coarser species of fish are captured, good returns were realized by the

SESSIONAL PAPER No. 22

fishermen. The fishing for whitefish and herring was exceptionally good during the past season, in fact, it is reported to me as being the most successful for many years.

In travelling over my district I find that angling has been very good and many Lakes and streams are showing good results from the stocking of young fish which goes on from year to year from the Fish Breeding Establishments.

The improved fishing in adjacent waters is no doubt largely responsible for the increase in the number of tourists visiting this section of the Dominion which means large expenditures of money benefiting all classes.

The bass ponds on the Bay of Quinté are doing good work, a large number of bass measuring on an average 3 inches in length being distributed each year.

I am sorry to say that carp, especially German carp appear to be on the increase, notwithstanding the fact that immense quantities are captured in hoop-nets each season. The question of some action being taken towards clearing the waters of these pests is becoming more urgent each year and the time is not far distant when very serious consideration will be necessary.

Inspector O. B. Sheppard, of Ontario, reports that as far as he can judge from his visits to the various fishing districts, the commercial fishing in his division has not been up to the average and not as good as last season, which was a very bad one. This applies especially to the Lake Erie district where the catch has so far been exceptionally light. The rod and line fishing shows a slight improvement over last season, especially in the Georgian bay district and in the inland waters. The law is being fairly observed but to my mind too great a number of netting licenses of all kinds are being issued, and unless this number is lessened, nothing can be looked for but a gradual diminution of our fisheries.

The carp are doing incalculable damage both in the international waters and in the inland waters where they have gained a foothold; as well as injuring the fisheries, they are destroying the wild rice which is the natural food of the wild duck.

Inspector A. G. Duncan, of Marksville, Ont., says:—As previously reported, the whitefish, salmon trout and sturgeon are gradually on the decrease and the catch of these species will not be equal to that of 1905.

The fishery officers under the control of the provincial government have been fairly diligent in attending to their duties, but as they are not provided with the means of a proper enforcement of the fishery laws there is no doubt but that the number of nets fished is in excess of the number allowed by licenses and for the same reason there is considerable poaching done by American vessels in my division.

It is an impossibility to enforce the fishery regulations unless the officers are provided with steam power to enable them to overhaul the tugs used alike by the Canadian and American fishermen.

MANITOBA.

Inspector Wm. S. Young, of Manitoba, reports an average fishing season.

The catch of whitefish will not show much of an increase or a decrease. Sturgeon will show a slight falling off, while pickerel, pike and tullibees will show a slight improvement.

6-7 EDWARD VII., A. 1907

However, the prices of fish received by the fishermen were just twice those of 1905. All fishing closed down the first day of September this year, instead of the 5th day of October as in previous years, so that when one considers that with a full month cut off the whitefish season, that the yield will be equal to that of the previous years. I think we will be able to congratulate ourselves on this achievement.

SASKATCHEWAN.

Inspector of Fisheries W. E. Miller, of Qu'Appelle, reports as follows:—This year will show an increased yield over that of 1905. The winter was very mild and allowed of ice fishing being pursued under very favourable circumstances. Heavy rains in June prevented the excessive lowering of the streams and lakes which had been looked for owing to the limited snowfall. Intense heat prevailed in July and August and some loss of fish was reported in the shallower lakes of southern Saskatchewan. Many more net licenses have been taken out by settlers wishing to fish on a small scale for their own use, and the amount of angling done again shows a large increase. The main winter export fishery was carried on at Moose lake where operations were very successful in the aggregate, though individual catches ruled smaller. In the Prince Albert district, a good winter catch was made at the Trout lakes leading to a renewal of the export trade which promises to grow considerably this coming season. At Cumberland the sturgeon fishing has not been so actively pursued this summer, but that fishery has been vigorously pressed in Cedar lake on account of its greater ease of access. Owing to increased local demand there is more fishing being done in the Battleford district and a considerable increase is expected there this coming winter.

ALBERTA.

Harrison S. Young, of Alberta, reports, that all creeks were very low when the ice went out in spring, many were almost dry, and they did not rise until after the June rains. Settlers put in dams to hold water for stock, and at many of these dams, fish were killed illegally. The guardians broke up many of these structures. There is but little commercial fishing in this district during summer. A few fishermen at Lac Ste. Anne, White Whale lake and Pigeon lake, supply the local trade in Edmonton and towns along the Calgary and Edmonton railway, but no fish are shipped outside the district. From all lakes the yield of white and other fish is reported good.

The guardian at Beaver lake, reports that a sturgeon was killed in that lake this summer, having found its way up the Beaver creek from the Saskatchewan. Sturgeon were formerly captured in considerable numbers at Victoria and Edmonton by spear and gaff, during the time they were passing up stream to spawn, when they take advantage of the eddies and slack water along shore. Since the fishery regulations have been enforced, the practice has stopped, and a sturgeon is seldom seen in Edmonton, an occasional one only being caught with a night line.

From reports I have received, I am afraid that there is great destruction of trout in the streams of southern Alberta, where the fishery regulations are not very well enforced. Dynamite is said to be used, I have reported fully on this matter. Reports may and probably are exaggerated, but I think there is no doubt that guardians should

SESSIONAL PAPER No. 22

be appointed to enforce the regulations, and prevent the destruction of trout that is now carried on. The Canadian Northern Railway will have steel laid on their line to White Whale lake this fall. This will allow of summer fishing in these lakes, and care will have to be taken that they are not overfished.

The fisheries of the district are all likely to yield as good returns as in former years. If accurate returns could be had of the amount of coarse fish killed, the value of the fisheries of the district would show a large increase. I cannot see, however, how at present, more accurate returns can be had.

The demand from settlers for fish with which to stock lakes where there are no fish, and from others to have bass or other game fish with which to stock waters where at present there are only suckers and pike, still continues, and the need of a hatchery somewhere in the west would seem to be more apparent every year.

BRITISH COLUMBIA.

Inspector C. B. Sword, of New Westminster, B.C.; says :—The sockeye salmon fishing may be considered practically closed, but it is quite impossible to give any estimate of what quantity of cohoes and other fall fish may be packed as this fishing is just beginning. The sockeye pack for this district has been very light about 178,500 cases, to which should be added about 7,000 cases packed in Victoria (district No. 3).

On Puget sound the same state of affairs was experienced 150,000 or 160,000 cases will cover the pack.

There has been a good run of spring salmon which, however, has been mainly shipped as mild cured or in cold storage.

Halibut, which (though properly belonging to district No. 2) is next in importance to the salmon fishing, will I expect show an increase of from 20 to 25 per cent over last year.

With the exception of these two varieties, I do not think that our returns will show very much change from last year, though I anticipate a moderate increase in all branches except of course the sockeye pack.

Ino. T. William, inspector of fisheries, says :—That in district No. 2, Northern British Columbia, he is not in a position to give even approximate figures and data, at this early date, as the season is not yet completed, and he can therefore only in a general way express his opinion on the fishery prospects. He says : commencing at the southern portion of my district, the sockeye salmon yield on *Smiths Inlet* has been most satisfactory, the canneries there have secured a full pack, and a large number of sockeye have reached their spawning grounds in the lakes at the head of this inlet.

Rivers Inlet has again supplied a full pack of sockeye salmon for the seven canneries in operation. Large quantities have also reached their spawning grounds on *Oweekayno* lake.

Northern Coast Canneries *Namu*, *Kimsquit*, *Bella Coola* and *Lowe inlet*, have also done well, the sockeye salmon catch having proved most satisfactory to the cannerymen, particularly at *Namu* and *Kimsquit*.

6-7 EDWARD VII., A. 1907

It was my intention to visit the head waters of the Bella Coola and Kimsquit rivers this fall, but owing to other important engagements, I have been obliged to abandon the visit until the spring of 1907.

The Skeena river has again proved a sad disappointment to the cannerymen, who have only succeeded in securing a half pack of sockeye, reaching about a two thirds pack including fall fish.

I consider this is owing to the barricading of the streams and rivers at the head waters by the Indians, and unless this is stopped, the Skeena river will gradually deteriorate. Owing to the Indians having erected barricades on Babine river this season, very few sockeye have reached the spawning grounds, consequently four years from this season we may expect an exceedingly poor run, of this valuable fish.

The Naas River canneries have done fairly well, securing about a two third's pack of sockeye salmon, one or two of the canneries nearly filling up on fall fish. With regard to the other fisheries in my district, I cannot give even an approximate opinion, though I understand the halibut and oulachon catches have been good.

Inspector Edward G. Taylor, of Vancouver, B. C., report as follows :—

During the past year the fisheries of my district (Division No. 3) have from one point of view been most satisfactory ; but in another aspect the season has not been as satisfactory as was anticipated.

The new whaling enterprise carried on in Barklay sound has been a marked success, and has rapidly developed into an extensive industry. Indeed for many weeks during the past year there was an average capture of no less than three whales daily. Occasionally captures of the valuable Sperm-whale added to the remarkably remunerative results of the whale fishery on Vancouver island.

The salmon fishery has brought excellent returns to the fishermen owing to the high price prevailing, and the large takes of spring salmon now in great demand. Some of the salmon trap owners have suffered a disappointment as the sockeye run was limited ; but many of the traps were compensated by the very fine catches of spring salmon and cohoes. The former being largely bought for 'mild curing' purposes—the latter for cold storage, for fresh fish trade in the Northwest Provinces.

The herring fishing was again pursued on an extensive scale, and has grown to be quite a leading industry. Nanaimo of course, being the chief centre. The catches of herring are cured in Nanaimo as kippers, bloaters and pickled as well as salted, and frozen for bait.

The demand for bait is very large for the halibut fishery ; quantities being exported to Washington State for that purpose, while steamers call at Nanaimo for supplies of herring bait on their way to the northern halibut banks.

There is a good opening for a crab-fishery as the crabs are of large size and extremely abundant. It is a growing industry, and during the past season quite considerable quantities were taken in my district.

SESSIONAL PAPER No. 22

Many localities in my district are famous for sport fishing, attracting anglers more and more every year as the spring salmon and cohoes afford fine troll and fly fishing. The Cowichan river, Campbell river, Englishman's river, Alberni canal and others have a wide reputation.

The much esteemed Olympian oyster abounds in quite a number of places in my district, and some of the beds as at Blunden harbour and Barklay sound are of very large extent. The demand, however, is so large that many oyster areas already show signs of depletion.

The Olympian oyster is of small size, often less than one fifth of the size of an average Atlantic oyster. The department has on several occasions carried out a scheme for introducing and planting the large Atlantic oyster; but hitherto they do not appear to have bred or increased. For the first time in British Columbia the eastern oyster, I am pleased to report, has produced spat, and I have obtained 'Seed' oysters probably a year old at points where the eastern oysters was planted last year.

During the month of July a Committee of the British Columbia Fishery Commission made a tour of the west coast of Vancouver island, and expressed their astonishment at the amazing fishery resources of the island, from Sooke to Quatsino sound. The party consisted of Richard Hall, M.P.P., and Mr. J. C. Brown, accompanied by myself were conveyed on the C. G. S. *Quadra* and received much valuable aid in their investigations from Captain Hacket.

During the herring season I was greatly assisted by the C. G. S. *Falcon* she proved very efficient in her patrol of the herring grounds.

It is necessary, however, for the proper patrol of the waters between the island and the mainland to have the services of a boat all the year round.

BAIT FREEZERS.

The aid to the sea fishermen offered and extended by the department in the direction of cold storage for bait, so as to ensure a supply of this essential article at times when there are no bait fishes on the coast, and bait cannot be otherwise procured, was begun as a departmental work in 1899, and in the year 1900 the first fishermen's bait freezer was established at Ballantyne's Cove, county Antigonish, Nova Scotia. The system was summarized in the departmental report for 1900 at page ix.

The success which attended the initial efforts as demonstrated by the local small 'fishermen's bait freezers' with a capacity ranging from 15 to 40 tons of frozen bait, according to the requirements of the localities, and designed to meet the immediate needs of the shore boat fishermen, during the periods of the dearth of bait, without which they could not carry on their fishing operations, attracted attention to the interests of the deep-sea bank fishing vessels, with a view to extending to that important branch of the fishery similar aid and conveniences.

The operations of the Nova Scotia fishing fleet was greatly hampered by a lack of this most elementary essential to a successful fishing venture; that is, an unfailing supply of good fresh bait; resulting in a desultory exploitation of the fishery rather than a concerted and remunerative one.

6-7 EDWARD VII., A. 1907

Believing that an impetus would be given to the business in which most of the fishing vessels were tied up for more than half of the year, the department undertook to extend the experiment to a practical effort to do for the bank fishermen that which the small bait freezer was doing for the shore fishermen.

For this experiment two points on the Nova Scotia coast were selected in turn; one at Canso, and another at Halifax, where large bait cold storage establishments were inaugurated with government aid under special conditions.

The latter establishment was intended more particularly to meet the needs of a large fishing fleet in Halifax and neighbouring counties, which was unable to avail itself of the winter fishing because and only because of the fact that it was impossible to rely on even a partial bait supply, but with this disability removed, it was confidently expected that the incentive would revolutionize the winter fishing operations in the western portion of the sea-coast of Nova Scotia.

The Canso establishment, the first inaugurated, was regarded as being of more general scope, for the supplying of vessels from all localities, visiting the banks of the Gulf of St. Lawrence as well as those of the Atlantic coast.

The departmental report—Fisheries—for the year 1905, contains full descriptions of these two extensive bait cold storage plants and their processes as distinctive in type, importance, cost and principle from the small shore 'Fishermen's Bait Freezers', which range in cost from about \$1,000 to about \$4,500, according to relative importance and demands of localities.

The Canso establishment sold to United States and Canadian fishing vessels this season up to date, 271,823 pounds of frozen bait, of which 1,554 pounds were herring, the remainder being squid. The price received for the squid was 3 to 3½ cents per pound and that for the herring 2½ cents. The bait remaining in the freezer up to September 29 of this year being 2,000 pounds of herring.

The Halifax establishment was ready for operation in time to provide bait to applicants at the beginning of the year, and that the expectations of its value to the fishermen during the winter season was fully realized is shown from the following summary. From the 1st January to 25th April, 1906, the frozen herring bait disposed of from that plant was:

To inshore vessels and boats	38,323 lb. at \$1.75 per 100 fish.
To offshore banking vessels	182,090 lb. at 3 cents per lb.
To dealers in bait	29,547 lb. at \$1.65 per 100 fish or 3 cents per lb.
To U.S. vessels	14,040 lb. at 3½ cents per lb.

The bait thus supplied is stated to have turned out first-class and to have given satisfaction to the fishermen. The establishment was able to supply all those who made application for bait leaving about 100 tons on hand at the end of April, and the belief was expressed that the existence of the freezer there was appreciated by those who had already purchased bait and would encourage and stimulate the fishing industry, by removing the uncertainty of supply which previously ruled. The stock of frozen herring on hand was by the end of September augmented to 150 tons, while

SESSIONAL PAPER No. 22

freezing operations were continuing, and it is expected that when the time for using frozen bait arrives, about the beginning of November when the fresh bait supply fails, there will be enough to supply the demand.

The number of small shore fishermen's bait freezers, continues to grow. There are now constructed :

In Nova Scotia.....	29
In Quebec.....	10
In Prince Edward Island.....	5
In New Brunswick.....	2
	—
	46

During the year there were established in Quebec, three new freezers, one at St. Godfrey, one at Gascons and one at Bonaventure East, in Nova Scotia, one at Digby and one at Lunenburg, and in New Brunswick one at Caraquet.

In addition to these there are under way new freezers at Sydney, at Half Island Cove, and at New Harbour, and in Quebec, one at Newport Point, Gaspé county. There are also in contemplation probably to begin this year, two freezers at Magdalen Islands, one at Carléton, Quebec, and one at Shippegan Island, New Brunswick.

At the outset it was somewhat difficult to overcome the prejudices of the fishermen against frozen bait, the popular fallacy obtaining that it would not be effective and was easily torn from the hooks, but the persistent demonstrations of its practical usefulness, and efficacy, together with the fact of its providing a long felt want, have operated to remove those prejudices, and converted the opponents into advocates of the scheme.

This growing confidence and appreciation is shown by a new feature in these small bait freezers this year. Hitherto this class of freezer has been limited, as above stated, to a capacity of from 15 to 40 tons, but recognizing their value, the associations of fishermen interested at Digby and Lunenburg in Nova Scotia, and at Caraquet, New Brunswick, arranged for freezers with a capacity of 100 tons as necessary to meet their requirements, and the establishments at these places will operate on this increased basis.

Mr. Peter MacFarlane, of New Glasgow, Nova Scotia, the department's officer in charge of the establishment and construction of the shore boat fishermen class of freezers, reports the season as very favourable to a furtherance of the scheme. His report forms appendix No. 12 hereto.

DOGFISH REDUCTION WORKS.

The Fisheries Department Report for the past two years, treats somewhat fully of the experiment of a probable means of coping with the dogfish nuisance, by which that menace to the operations of the fishermen may be turned to some commercial advantage, which, if not wholly satisfactory from the standpoint of the fisheries generally, might form a partial offset to the disabilities involved in the inroads of these predacious fish, at least to the extent to which they may be utilized for the manufacture of oil and fertilizer.

The Shippegan reduction works which were completed last year about the end of the season, were operated at that time only sufficiently to establish the working of the machinery, hence the output was very limited. It started in this year, however, about the 27th July, and has been working continuously up to the time of writing, and it is expected that the season will close with very successful operation and a large output of oil and fish scrap for fertilizer.

The Canso establishment was ready last year when the dogfish first appeared in that locality, about the second week in September, and continued operations up to the end of the season in December.

This year this establishment began operations on the 13th September, and is continuing at the time of writing up to its full capacity.

The experience gained at both establishments last season, which were their initial years, has had the effect of suggesting minor details in methods which will probably result in an improvement in the quality of the fertilizer scrap and oil produced.

While at these points where these establishments are located, the dogfish can be secured in sufficient quantities under existing conditions, the complaints against this scourge, although serious and general, have not been so widespread and acute as in recent years. It may be too soon to hope for relief from this great disability, but it also may be the beginning of a gradual disappearance of the dogfish as the history of the fisheries has shown to have occurred at intervals of varying extent. The present visitation is probably one of the longest and most extensive that has occurred in the recollection of the fishermen.

THE SOURIS FISH DRIER.

The fish drier, which was so successfully launched at Souris last year, with the object of bringing prominently before the fishermen engaged in line fishing for cod, hake, haddock, etc., the expediency and practicability of adopting improved methods for the drying of their catches, in order to enable them to place on the markets of the world an article equal to the best of its kind, and so obtain the highest prices prevailing, and to which extended reference was made at page xxix of the Annual Report of the Department of Marine and Fisheries,—Fisheries,—for the year 1905, continued operations this season under the same efficient management and on the same lines as last year.

Drying started this season on the 8th May, and up to the 21st September there were received at the drier the following quantities of the different classes of fish:—

Dry cod	9,790 lb.
Kenched cod	241,671 “
Green cod	7,257 “
Dry hake	39,686 “
Kenched hake	84,193 “
Green hake	80,476 “
Up to the date mentioned above, the following quantities were shipped:—	
Cod	121,113 lb.
Hake (and haddock)	65,438 “

SESSIONAL PAPER No. 22

These fish were shipped to Barbados, Jamaica, Boston, Great Britain, and Charlottetown.

In addition to drying, the putting up of boneless fish on a small scale, was undertaken this season, in connection with which a patent press was installed, for taking care of the scraps and pressing them into blocks. Since this work was started in the latter part of July, 6,595 lb. have been so put up, and have found a very ready sale in both Canadian and United States markets.

That the object for which the drier was established is already being achieved is demonstrated by the fact that in its vicinity a very noticeable increase in the number of men engaged in line fishing has obtained, with a consequent increment in the quantities of fish caught.

THE BEHRING SEA QUESTION AND PELAGIC SEALING.

Last year's report dealt somewhat fully with the most recent formulated proposal of the United States' government, referred to the Canadian government, which was that Great Britain should agree to a prohibition of killing seals at sea during August and September and that the United States would in compensation therefor consent that such hunting should be permitted during May and June instead; these two latter months being within the term of the close season provided by the Paris Award Regulations.

As the net result of compliance with this proposal, would involve the voluntary relinquishment by the Canadian pelagic sealers of the most remunerative two months of the year, comprising practically the whole of the Behring Sea season, for two months when little or no sealing is done, coming as they do between the defined seasons.—that is the spring season up the coast and the fall season in Behring Sea, it is needless to say that this interested proposal did not find favour in Canada and consequently was not entertained. Some pertinent explanations of the situation are contained in the reference above noted. There is no change in the standing of this question since that report.

Owing to the necessity for readiness for an exceptionally early session of Parliament, the report of the department is prepared practically three months before the expiry of the year's general fisheries operations, which precludes the possibility of the publication herein of the usual statistics of the pelagic sealing industry for the current season with notes and remarks thereon, since the requisite data is not yet available.

FISHERIES PROTECTION SERVICE.

The report of the Fisheries Protection Service will be published in a supplement at the close of the calendar year, as the vessels comprising the fleet are now actively engaged on their several stations, it would be impossible to deal with their reports at present.

With the exception of the Steamer *Princess* replacing the *La Canadienne* in the Gulf patrol, the protective fleet of 1906 is the same as the previous one, consisting also of the *Canada*, the *Curlew*, the *Petrel*, the *Osprey* and *Constance* in the maritime

6-7 EDWARD VII., A. 1907

provinces ; the *Vigilant* in Lake Erie : and the *Kestrel* and *Falcon* in the British Columbia waters. The above cruisers were commanded by the same experienced officers, and were assisted by four sea-going steam launches in the patrolling of the Atlantic coast.

Two United States fishing schooners were seized off the coast of Cape Breton for fishing within the three mile limit. They were subsequently released upon payment of fines.

More foreign vessels must have taken advantage of the *modus vivendi* licenses, as the amount of such fees is much larger than in 1905. The fishing season has still several weeks to run.

OTTAWA FISHERIES MUSEUM.

Last year's report of the Canadian Fisheries Exhibits or Museum contained a list of the specimens embraced in the collection. This year, the curator, Mr. A. Halkett, submits not only a general summary of the said collection, but adds descriptions of the vertebrate portion, especially the fishes, after the manner of the guides to the galleries of the British Museum.

This report will form an appendix of the supplement to the 39th Annual Fisheries Report, to be published at the end of the calendar year with other matters, which it was impossible to embrace in the main report, owing to the early meeting of Parliament.

THE FISHERIES STAFF.

The outside staff of the fisheries branch of the department is larger than may be generally supposed, numbering to over nine hundred and fifty employees, subdivided as follows : Twenty-four inspectors of fisheries and special officers; 112 overseers of fisheries with magisterial powers *ex-officio*, and 440 guardians, temporarily employed to assist the other officers in the protection of fish. The officers in charge of our thirty-two fish-hatching establishments with their permanent assistants aggregate over seventy employees, not including other persons employed during the busy season. The officers and crew of our protection fleet of cruisers aggregate 267, and there are also about forty-five persons employed as reporters for the Intelligence Bureau during all the fishing season, who are not otherwise connected with government work.

A complete list of these different services will be issued in the supplement to our annual report at the end of the calendar year.

PROVINCIAL AND DOMINION JURISDICTION.

As has been from time to time intimated, since the decision of the Judicial Committee of the Privy Council in 1898, the department has been, by agreement with the provinces, administering fisheries matters, as previously, pending some definitive adjustment of the relative rights and jurisdiction exercisable by the provinces and Dominion in regard to the fisheries.

SESSIONAL PAPER No. 22

The only exceptions to this arrangement is the province of Ontario, to which the proprietary right in the fisheries were handed over at the time of the decision on the fisheries reference to the Imperial Privy Council, and the province of Quebec where such proprietary rights were handed over at that time as affected the inland waters from a line drawn across the St. Lawrence from Pointe des Monts to Cape Chatte. This handing over of property rights involved in the issue of licenses, however, in no way affected the federal jurisdiction as to legislation and fishery regulation, which is exclusively vested in the Dominion government as distinct from any property interest held by the provinces.

It is hoped and expected that whatever agreement may be reached by the conference of Provincial Premiers convened at Ottawa at the time of this writing, touching the relations of the provinces with the Dominion, will pave the way to some basis upon which a final adjustment of the relative jurisdiction of Dominion and Provincial government over the sea-coast and inland fisheries can be reached.

I have the honour to be, sir, your obedient servant,

F. GOURDEAU, Lt.-Col.,
Deputy Minister of Marine and Fisheries.

1906

SPECIAL APPENDED REPORTS

I

HOW TO ESTABLISH A TROUT-POND.

BY PROFESSOR EDWARD E. PRINCE, DOMINION COMMISSIONER OF FISHERIES, OTTAWA.

Travellers in China from early times have marvelled at the zeal and ingenuity displayed by the Celestials in the cultivation of fish and in the maintenance of fish ponds. In Canada, lakes, large and small, are innumerable in every part of the country, with very few exceptions, and as a rule they are, or have been, until recently, inhabited by fish. Trout, speckled (*Salvelinus fontinalis*) gray trout (*S. namaycush*) and red trout in the east, and rainbow, black-spotted, and Dolly Varden trout, in the West, have occurred in vast numbers in these illimitable waters. There are, however, once prolific lakes from which these fish are now absent, while in extremely rare cases, the lakes appear to have been naturally barren and have never contained any fish. I have recently heard of three such lakes, one in the province of British Columbia, the other two in the province of Quebec.

When once a lake or creek has been inhabited by fish, there always remains the possibility of its restoration if appropriate steps be taken: but in those cases, extremely rare in the Dominion, of waters permanently barren of fish, some preparatory measures are necessary. In the present concise report I deal with both kinds of lakes or ponds, and in addition, I give some instructions as to the methods of procedure in creating or establishing new trout ponds.

For the successful cultivation of trout, or indeed of any of the better kinds of fish, it is necessary to secure the following conditions:—

- (1) Pure and abundant water.
- (2) Shallows for spawning, and deeper portions for hiding and for wintering in.
- (3) Food in plenty and variety.
- (4) Shadow and shelter from glaring sunlight.

I take it for granted that proper precautions are taken against enemies, man, beast or bird, as failure in establishing successful fish ponds has frequently found explanation in midnight marauding by poachers, or in visits of sheldrakes, kingfishers, &c., or in other cases mink, otter and other fish-eating animals. Many so-called enemies are, however, entirely innocent of fish destruction. All ducks are not fish-eaters, and sandpipers, plovers, snipe, &c., beaver, muskrat, water-shrews, and similar creatures, do not devour fish: but live almost exclusively on vegetable food, water plants, insects, &c. The fish poacher is the worst enemy, and effective fences are almost essential to success.

I shall deal with the formation of a trout pond, and in the latter part of this report shall treat of the best methods of stocking it with fish.

Water.—The first condition necessary for success is pure water, with, if possible, an inflow and an outflow capable of being regulated by movable gates. Spring water is best, especially if of low temperature in summer, 46° to 54° F. being very favourable.

Trout will live, and indeed, flourish, in still water, with no very apparent inflow, and even in such confined spaces as a rain-tub, a few trout have been kept for long periods: but the fish become tame and languid, the flavour of the flesh is affected, and they are always much stunted in growth. Hence if possible a portion of a stream or

small creek should be so diverted by a narrow channel or underground pipe, that a continuous flow of water can be supplied to the pond or small lake. With such a continuous inflow the trout placed in the pond will be healthier, more gamey, and in better condition generally.

It is well-known that aëration of water goes on at the surface, and any comparatively shallow stretch of water, especially if agitated at times, or ruffled by winds, will be purified, and be able to sustain fish life. I am acquainted with one case in which some young salmon, kept in a bucket placed in a hole in the ground, lived for three or four years in a healthy state; but were much stunted in growth. They grew from a length of $1\frac{1}{2}$ or 2 inches to 6 or 8 inches; but never exceeded that diminutive length.

THE BOTTOM.

The bottom of the pond should be of rock, clay or sand; but loam, mud or peat, imparts a flavour and colour to the water which affect trout unfavourably. Every one is aware that fish, taken in a wild state from lakes and streams, may have a disagreeable flavour, when cooked; at times, indeed, they are quite inedible on that account. If portions of the bottom are covered for a few inches with clear river sand, making a smooth surface, the fish will be found to lie there by preference, as soft mud or clay bottoms are avoided by trout as far as possible. It is absolutely essential that shallows covered with coarse gravel or pebbles should be provided in order that the trout may resort there at the spawning time. They can be netted, when on these stony shallows, and the spawn taken from them, as (unless the conditions are altogether unusual) the eggs if left on the pebbly bottom will become unhealthy and will die. A good supply of water pouring over the gravel, and reproducing the favourable conditions of the natural spawning beds, will of course enable the eggs to be incubated and hatch out in due time. The eggs are, however, better removed from the pond or creek and treated as set forth in my special report published in the twenty-eighth Annual (Fisheries) Report of the Department of Marine and Fisheries, 1895, on the hatching and rearing of trout.

DEPTH OF POND.

An ideal trout pond should increase in depth from the upper gravelly end where the water flows in, and where it is three to six inches in depth, down to the lower clay or rocky portion where the depth should be 5 to 8 or 10 feet or more in depth. To these deeper portions the trout will move for safety and shelter, especially in winter when the danger of freezing in the shallow parts is thus avoided. Further, the small trout will haunt the shallow bottom, while the larger fish will keep in the deeper water, excepting on sunny days or when prompted to indulge their cannibalistic propensities. Large trout will at times readily feed on young trout, and sometimes prefer them, though normally a good supply of insect food fully satisfies them. As a haven of safety for the small fish it is necessary to provide a considerable shallow area in all trout ponds. Three ponds, one for fry and yearlings, not more than 24 inches deep at the lower end, a second for young trout up to 2 or $2\frac{1}{2}$ years of age, 36 or 40 inches maximum depth of water and a third pond, with five feet of water at the deepest end for three and four year old fish is a very convenient arrangement, where feasible.

FOOD IN POND.

The question of a supply of appropriate food is all important. Insect food is really the best, and in a new pond, before an insect fauna is established in it, and May-flies, dragon and stone-flies, &c. take possession and breed, an effective means of creating a supply of water-insects, is the introduction of a tub-full of green-weeds, scraped from the bottom of an old-established pond, or weedy creek of a river, into the pond. Such weed material will be found to contain an incredible amount of insect life, eggs, larvæ,

SESSIONAL PAPER No. 22

&c. and small water-snails in abundance. The weeds chosen should be the matted masses found in still parts of a river or creek. To follow this plan is the readiest method of establishing a supply of insect food, which is undoubtedly the most favourable feature in any successful trout pond. I have, in a former special report, given notable examples of the superiority of insect-food over all other forms of nutriment for half-grown and adult fishes. It hastens growth, improves the flavour of the flesh, intensifies game qualities, making the fish alert and active. Sir James Gibson Maitland recommended a mixture of eggs, flesh, &c., made into a tenacious paste and pressed through a strainer pierced with holes, so that worm-like convoluted fragments were formed. These the fish fed upon most greedily, but it was an expensive food and laborious to prepare. Artificial foods, chopped liver, or flesh, ground-up fish, boiled cereals, &c., prepared in various ways, are far less favourable for fattening trout. Frank Buckland recommended hanging the dead carcass of a bird or dog or even a large fish, from a branch over the pond, and after it became putrid and maggoty, giving it an occasional shake. At each shake the maggots would drop in hundreds into the water and form an admirable food for fish. The fat juicy maggots or larvæ of the blow-fly or blue-bottle fly, are a most nutritious and appropriate food. Trout grow amazingly if fed on insect food, and have better health and finer game qualities than when fed on butcher meat, liver or offal. Young trout greedily catch and eat the minute crustaceans which abound in fresh water: but the cultivation of small Entomostracans, *Daphnia*, *Cyclops*, and the like, cannot be successfully carried out, unless after technical scientific training. For the methods to be adopted for the cultivation of these minute forms of life as fish-food reference must be had to fish-culture treatises by specialists. A few of the smallest species of chubs or shiners will furnish additional food if introduced, and if these small minnows breed, the delicate newly hatched fry, in spring and early summer, will form dainty food for the trout. Care must be taken that no sticklebacks or 'pin-fish' are included with the harmless chub and shiners. The undesirable fish are recognized by the presence of three or more pin-like spines on the back. They are, in some localities, erroneously called minnows (see my report on 'Vernacular Names of Fishes', Report of Mar. & Fish, 1900.) and are surprisingly pugnacious and destructive. Any introduced by accident or mistake should be at once netted and removed, they bite and injure the fry of larger species, and devour an amount of small insect-food wholly out of proportion to their own small dimensions.

SHADY BANKS ESSENTIAL.

Shallow ponds being exposed to the glaring sun readily become warm. Trout cannot bear heat and can live in health only where the water is cool, clear and sparkling. Not only so, but their large sensitive eyes, unprovided with lids or shaded by eyebrows, are exposed to bright light, which blinds and injures them, and introduces sickness and weakness. If the sun is very bright they hide away, when living under natural conditions, moving into deeper shady places, and only coming out in the evening or in the early morning, when the sun's rays are oblique and less powerful. A few trees carrying thick foliage, or a row of low overhanging bushes, willows or alders, will provide the necessary cool shelter, if so situated that some of the deeper parts lie in shadow when the sun is high at mid-day. Floating wooden rafts or screens are preferred by many as the falling leaves in October are a source of annoyance, where trees are planted for shade purposes.

PONDS SHOULD LIE FALLOW.

The pond having been prepared and the foregoing conditions having been observed, it should be left for two or three months in spring until its newness has worn off and the insect and minnow life have become established.

6-7 EDWARD VII., A. 1907

HOW TO STOCK (ADULT FISH OR FRY).

A few dozens of adult wild trout netted, under the authority of a permit, which the Hon. the Minister of Marine and Fisheries, Ottawa, has alone the power to issue, should be conveyed in casks of water or tanks, and liberated in the pond.* They should be left undisturbed for a year, fed if it seems necessary, but not disturbed or fished for. Many of them will be observed seeking the gravelly shallows in due time for the purpose of spawning. They might be allowed to spawn naturally during the first season, especially if they have been caught in the late summer, or fall: but the eggs will probably not incubate and hatch out in the confined area of an artificial or newly established pond. In later seasons, the eggs, as already stated, should be taken from the fish, fertilized, and incubated, and hatched artificially, as better results can be relied on, and many dangers can be thus avoided. In the second year angling may be carried on, and all but the largest trout returned to the water, unless very badly hooked.

Some trout culturists prefer to stock ponds with small trout-fry, either newly-hatched, 5 or 6 weeks old, or fingerlings, 9 to 12 months old. If the conditions are favourable this stocking with young fish, either "alevins" or "fingerlings" is bound to be successful: but three or four years at least must elapse before the pond will furnish any angling. The rate of the growth of trout and other fish need not be dwelt upon in this place, as I have treated the subject in my special report on the "Maximum Sizes of Fish" in the Department's Report, 1903. It is difficult to give definite directions respecting the number of fish, which can be safely retained in a pond: but a spring $1\frac{1}{2}$ in. square in volume, at a temperature of about 50° F. and flowing through a tank 24 ft. long, 2 ft. wide, and $1\frac{1}{2}$ ft. deep *i.e.* 72 cubic feet capacity will accommodate a thousand trout 9 to 13 inches long. Norris regards such accommodation as favourable, *i.e.* 10 trout to each cubic foot of flowing water. The trout were fed on curds every second day— $2\frac{1}{2}$ quarts to a thousand fish. Half that number would, as a rule ensure better growth and more healthy fish.

RESERVE POND DESIRABLE.

It may be added that a very advantageous arrangement is that of providing an additional pond, one flowing through a narrow channel into the other. The formation of two ponds affords many advantages. If gates be provided and a lateral overflow pipe be arranged, one pond can be run dry when desired and the fish taken out, or the bottom of the pond cleaned or rearranged. The Hon. Roger North, one of the earliest English fish-culturists, recommended the drying of fish-ponds at intervals. He advised that they should lie fallow like a field, and the grass be allowed to grow: but he had in view the coarser kinds of European fish living in weedy sluggish waters, not those finest fish of all the finny tribe the trout of clear English and Scottish streams or of Canadian lakes and rivers. Further, the migratory trout, when passing up the narrow channel on their way to the gravelly shallows, which are suitable for spawning beds, can be secured either by means of barrier-nets of small mesh, placed across, or by an arrangement of wire-cloth movable gates; both these devices allowing the water to flow through, but barring the fish and retaining them until convenient for taking the eggs and incubating them in a hatchery.

Finally, owners of trout ponds hardly need to be reminded that, even though trout are confined in privately owned enclosures, the provisions of the Dominion Fisheries Act and Regulations under it apply to them.

* Norris states that he carried 150 adult trout, for a distance of 60 miles, in a 40 gallon cask, two-thirds filled with water, and with a piece of ice dropped in now and then.

II.

THE PACIFIC FISHING INDUSTRIES OF CANADA

BY PROF. EDWARD E. PRINCE, COMMISSIONER AND GENERAL INSPECTOR OF FISHERIES
FOR THE DOMINION OF CANADA.

The Pacific fisheries of Canada are carried on in the waters, marine and fresh water, of those two vast geographical divisions, the Yukon District and the province of British Columbia. The former may be described as having roughly the form of a right-angled triangle, whose base is an arc of the 60th parallel of north latitude, its perpendicular an arc of the 141st meridian, and its hypotenuse, the Rocky mountains; and the latter territory (British Columbia) may be compared to an enormous quadrangle, 700 miles long by 400 miles wide, stretching from the 49th parallel (or more correctly, from an imaginary line in the middle of the Straits of Fuca, continuous, off Point Roberts, with the 49th parallel) up to the 60th parallel, and including the adjacent islands, large and small, south of the 55th parallel. The inland waters are comparatively unimportant as compared with those of the sea, when viewed from a commercial standpoint. The rivers are, it is true, of the highest value as the breeding resorts of salmon, and the upper waters, the lakes and streams, furnish food for the native Indian tribes, for the settlers, and inland communities. The lakes on the whole are not prolific, but many of the mountain streams and large tributaries cannot be surpassed for the excellence of the sport they afford. Nowhere can the angler find trout (rainbow, mountain spotted or cut-throat, and Dolly Varden) of finer game qualities. About a hundred and fiftieth part of the total area of British Columbia consists of lakes, while in the Yukon District the lakes, it is estimated, cover barely one three-hundred-and-fiftieth of the total geographical area. In these lakes and rivers large trout occur, some reaching a weight of 20 lbs. to 30 lbs., while whitefish, small grayling, and certain land-locked species of salmon, are also found; but their total value in the Yukon Territory and in British Columbia does not exceed \$150,000 per annum.

The sea-fisheries are amongst the most prolific and valuable in the world. They have been developed along the coast of British Columbia to a marvellous extent, and they are capable of enormous expansion. The amazing feature of these fisheries is that they may be carried on in waters perfectly land sheltered. Hecate Straits, Dixon Entrance, Queen Charlotte Sound, and the Straits of Georgia, with innumerable deep inlets, bays and arms, are so shielded from the open ocean as to furnish unique conditions for the pursuit of fishing operations. Vancouver Island and the Queen Charlotte Islands form a barrier against the storms of the waters outside, while the shores of these islands are themselves penetrated by extensive channels, arms and bays abounding, like the adjacent ocean waters, in the most valuable economic species of fish. The investigations carried on by a committee of the British Columbia Fishery Commission, during the past summer (1906) proved that extensive feeding grounds for fish occur on every part of the coast from Victoria to Naas river. The bottom is in numberless places literally alive with invertebrate animals, especially shell-fish, annelids, shrimps, and sand stars, which constitute a very large part of the food of the most esteemed kinds of marketable fishes. The greatest spawning and feeding grounds in the world for herring, halibut, flat-fishes allied to the plaice and sole, and numerous other food fishes occur within the vast sheltered area (covering nearly 30,000 square miles) extending from the international boundary line on the south to the Alaskan limits in Dixon Entrance on the north, and shielded from the open ocean by Vancouver Island and the

6-7 EDWARD VII., A. 1907

Queen Charlotte Island group. The number of large rivers which take their rise on the Pacific slope of Canada is astonishing, including, with one or two exceptions, all the great salmon rivers on the western watershed of North America. The Fraser, Columbia, Thompson, Skeena, Naas, Stikine, Liard, Yukon, Pelly, Porcupine, Peel and other vast streams all have their sources in British Columbia or the Yukon District, and most of them rank as the greatest salmon rivers in the world, and flow during their whole course through Canadian territory, though some like the Yukon, the Stikine, and the Columbia debouch into the sea beyond its boundaries. It is an axiom amongst fishery authorities that food fishes improve in flavour and quality in cold northern waters, and it must be admitted that these Pacific fishing grounds possess for that reason an enviable position. But the very plenitude of these fishery resources prevented a proper appreciation of them for many years, and even yet their real value, and their importance as entitled to rank amongst the greatest fisheries possessed by any country, are generally underestimated. While the salmon canning industry has for a quarter of a century occupied a prominent place amongst Pacific commercial enterprises, it is barely fifteen years ago since the immense value of the British Columbia halibut banks in Hecate Straits and Dixon Entrance was first appreciated, while the rich herring harvest along our Pacific shores went to waste until five or six years ago. 'More money has been sunk in mines than will ever come out of them,' said an eminent British Columbian to me some years ago, 'and,' he added, 'even after our lumber has all gone and our forests have been cut down, our fisheries will still remain to supply labour and food, and are our most permanent natural resource.'

That other fishery enterprises than the salmon industry urgently call for development has long been apparent to those familiar with marine and fresh-water fisheries. With my extensive experience, as a fishery official in both hemispheres, and my special knowledge of the North Sea and Irish fisheries, as well as my complete knowledge of the vast fisheries of Canada, I was more than twelve years ago impressed with the unlimited possibilities of the British Pacific fishery resources. My public statements to that effect and my efforts to stimulate interest in deep-sea fisheries were not adequately seconded, mainly because the firms prominent in the salmon business were largely engaged in other enterprises, shipping, general supplies, grain, furs, etc., and were not really fishing firms whose chief interests were bound up with the fish business. Certain United States firms were, however, not slow to grasp the commercial value of the deep-sea resources of the province, and to them is largely due the growth of important halibut fisheries, and the like.

SALMON.

The salmon industry of British Columbia claims the first place in any review of the provincial fisheries, but the details are so well known that it is necessary to refer to certain salient features only.

Since salmon canning operations began in a small way on the Fraser river in the 'sixties,' until the present time, when about seventy canneries are operated on the coast, its growth has been gradual and healthy. The main operations have been confined to four centres, the Fraser, the Skeena, Rivers Inlet, and Naas river, each, excepting the last, separated by a distance from each other of from two hundred and fifty to three hundred miles. At Lowe inlet, Namu, Alert bay, and at Clayoquot, on the west coast of Vancouver Island, canneries have also been long in operation, but the principal centre, with 42 canneries, has been the Fraser river. Twenty years ago, in order to guard against excessive fishing, the limit of 500 was placed upon the number of fishing licenses issued; to-day over 3,000 licenses are issued, the licenses being required not for canning or packing but for fishing. During the greater part of the history of the industry one kind of salmon may be said to have been mainly handled, viz., the sockeye, the vermilion-fleshed salmon of the Fraser and of British Columbia rivers generally. Spring salmon or chinooks, cohoes, dog salmon, hump-backs, and steelheads, were plentiful though infinitely less so than the marvellously abundant sockeye, and these less important fish were frequently thrown away. Some were smoked, others salted or frozen, but the British Columbia salmon par excellence was the sockeye.

SESSIONAL PAPER No. 22

A widely prevalent belief exists that every fourth year is a 'big year' on the Fraser, and no doubt some foundation exists for the belief, though the periodicity is not perfectly confirmed. Large runs during the last thirty years have, indeed, occurred three times in 'fourth' years, twice in 'fifth' years, once in a 'sixth' year, and three times in a 'third' year. There is however, even less semblance of periodicity in the northern rivers of the province. With the increasing demand for fish, salmon, other than sockeyes, have been increasingly canned in British Columbia, and official statistics show that of the salmon pack on the Fraser (1904) of 129,000 cases, over 51,000 cases were of these previously neglected kinds of salmon. In the last big year (1905), of the total Fraser River pack, 846,988 cases, 39,647 were cohoes, spring salmon, &c. Formerly the pack was made up of 1-pound talls, whereas now the demand is for 'flats.'

Other changes are observable in the industry. The Indians and white fishermen have been largely displaced by Japanese. It is stated that 85 per cent of the Fraser river fishermen are Japanese, and in some canneries 90 out of every 100 employees are from Japan. Chinese labour prevailed in the packing establishments owing to its cheapness, but the price of that Oriental labour has immensely increased: \$30 to \$40 per month, in addition to board, being now paid by some canneries. The question of labour is one of the most serious to be faced in the Pacific salmon fishery as in so many other western industries. Hence labour-saving machinery is being increasingly introduced. Already salmon canning involves some of the most wonderful labour-saving machinery ever invented, including full lines of can-making machines, by which the tin cans are manufactured from tin plate, ready to be filled; fish cleaning machines by which the fish are opened and cleaned as thoroughly, and much faster, than by hand; fish-cutting machines by which the salmon are cut into pieces of the appropriate size for the cans; filling machines by which the cans are filled with fish at the rate of one can per second; topping machines by which the covers are fitted upon the filled cans; crimping machines by which the covers are crimped after being fitted, and soldering machines by which the covers are soldered on the filled cans—all working automatically and in conjunction with one another in the utmost harmony.

No question as to the cleanliness in handling the product can legitimately arise. It is scarcely touched by hand, and never carelessly treated, as the above enumeration of devices used in these great canneries demonstrates, while each establishment is kept as clean and sweet as a well regulated kitchen.

The Fisheries Commission authorized by the Dominion Government to investigate the fisheries in 1905 and 1906, paid visits of inspection to the various salmon canneries, especially those on the Fraser river, and their report upon the cleanliness of the methods adopted, the abundance of fresh water, and the rapidity characterizing the utilization of the fish after capture, was of the most reassuring and satisfactory nature, in view of the 'revelations' made public in the meat canning industry of the United States.

The process of handling the fish has often been described. But the following brief summary may be given. After the salmon reach the cannery they are conveyed to tables where the fish are cleaned, head and fins removed, and after being cut into small 'chunks' by machinery, they reach the women who act as 'fillers.' These fill the cans by hand and place them on a conveyor where they go to the crimping machine. As they pass through this, the cans are scrubbed till they fairly shine. In the washing of the exterior of the cans, steam is used. After this, it is a mechanical process pure and simple. The filled and topped cans drop on an incline through the soldering machine, and then the cans are allowed to cool, preparatory to being taken to the retort.

The first hot bath of the canned sockeye lasts thirty minutes.

Placed on tables, the cans are then pierced by a small hole at a marvellously rapid rate by trained employees. The vent allows the gas to escape as well as the surplus heat. Following the venting, which takes but a few minutes, the cans are again hermetically sealed and in they go to the steam retorts at a temperature of 240° F. and a pressure of 15 pounds to the square inch.

It is not possible for an atom of foreign matter to get into the cans of salmon in any of these various processes. The strictest care is exercised. In fact, the whole process is so rapid that there is absolutely no chance for contamination.

An hour and a quarter is the time given in the steam retorts. Here the sockeye becomes the tender, rich and well flavoured article of commerce in such demand. Every essential ingredient which nature implants in the sockeye is retained—not an iota is allowed to escape. The process makes absolutely certain the keeping qualities of the canned fish—it is not to be compared with any other treatment of fish of any kind. Trucks carry the canned product from the retorts, steaming hot, to the warehouses where the cans are cooled gradually.

Labelling by machinery comes next, after lacquering in the same manner, and then comes the casing. Here again machinery plays the main part. The boxes, made of spruce, utilizing thereby a great lumber product heretofore well nigh valueless, are supplied ready to piece together. The nailing machine in the hands of a skilful operator puts them together at a marvellous rate. Then the case is finished.

Many attempts have been made to fill the cans by machinery, but the result has never been perfectly satisfactory, the steaks of fish being pressed and jammed, so that bones, skin and scales are mingled together, and present a very undesirable appearance, whereas in hand-filled cans the pieces are carefully placed in the can, the skin and scales, as a rule, outside, and the appearance of the contents when opened is agreeable and appetising. More success has attended the effort to gut and clean the fish by machinery, thus avoiding the handling by Chinamen of the salmon fresh from the boats. The 'Iron Chink' or Smith cleaning machine was brought into use in 1905. It has the form of a large rotating wheel of complicated structure, and it is claimed that it cleans about 30,000 fish in a run of ten hours, and when running at full capacity does the work for which 51 expert Chinese cannery labourers were required. It needs about two horsepower to operate it. Only two operators are required to prepare a fish for the cleaning machine as it is now operated. The first man takes the fish as it comes down the elevator and guides it past a knife which cuts the head off. The second passes the fish by the knife which cuts off the tail. The fish is then ready for the machine and is placed in the feeding trough. It passes through the trough tail first and the back fins of the fish come into contact with a self-sharpening knife which trims off the large and small fins. An automatic feed in the trough works consistently with the clamps on the wheel, six in number, and the fish is caught in the clamp by the tail, carried up through a centering device which holds it firmly, when the back clamps close on it. Self-sharpening, self-adjusting knives at the top of the machine remove all the remaining fins in a uniform manner and the fish passes on down to the splitting saw, which is situated about one fourth of the way down from the top. The saw splits the fish in the exact centre, and it passes on, coming in contact with a rotary grappling device which removes the entrails and stirs up the blood on the backbone, leaving it ready to be washed out with the aid of a stream of water and a rotary brush. The fish then travels on to within three inches of where it entered the wheel, and released, it slides on to a conveyor. After that the fish passes through the remaining processes above described. If the fish vary very much in size, the machine is apt to miss removing some of the fins and some hand cleaning is often necessary after the fish, 'gutted and finned' comes from the 'chink'. The apparatus is already installed in some of the British Columbia canneries, and a great many were operated in the United States canneries. I saw it in use in the Pacific American Company's cannery at Bellingham. This is the largest salmon canning plant in the world, and during the past season seven lines of machinery were operated. The two machines which were in operation there supplied the seven lines of machinery which packed on an average 9,000 cases of sockeye salmon a day, and two or three days ran over the 10,000 mark. At no time during the entire season, while the scows were bringing in the fish from the traps, was the canning machinery delayed for fish to pack. The iron chink kept them continually supplied and the lines of machinery never were idle for want of fish and frequently there were from 30,000 to 70,000 fish cleaned ahead.

No doubt in small canneries, and in seasons when the run of salmon is limited, a costly machine of this character may be less economical than the method hitherto general of employing Chinese cleaners and Indian klotchmen and white women as fillers.

SESSIONAL PAPER No. 22

Recently, there have been signs of a movement northward of canners, who regard the Fraser river as in peril, owing to excessive fishing in the Straits of Georgia and Puget Sound. A great increase in the number of canneries in the north, and along the west coast of Vancouver Island is certain, within the next two or three years.

Perhaps the most remarkable development is that of the dog salmon industry. These fish until recently were regarded with contempt, but so great is the demand from the Japanese market that more than 3,000 tons, dry salted, were shipped last year from the province. Just as the turkey is the universal dish at Christmastide with us, so a salted dog salmon is the chief item at New Year feasts in Japan. The usual price is said to be 50 cents each in the Japanese markets. Certain Japanese firms are prominent in the British Columbia dog salmon industry, and one of them salted over 58,000 of these fish in 1905, a total weight of nearly 200 tons (the salt salmon averaging 7 pounds, i. e. 300 to a ton).

In the adjacent United States territories, especially in Alaska, this salt dog salmon industry has assumed importance, but the recent Japanese tariff bill provides that fish must be caught or taken by Japanese fishermen on board Japanese ships in order to secure free entry into the Mikado's dominions.

The United States laws will not permit Japanese fishermen carrying on the fishery in Japanese bottoms, and a duty of 2 yen per 132.9 lbs. (i. e. about \$1 per 133 lbs.) will be exacted by the Japanese authorities. The United States Consul General at Yokohama recommended meeting the case as follows:—

‘If it is the desire of the United States government to promote the export of dry salted dog salmon from Alaskan waters to Japan, it would seem to me that the simplest way to do this would be by letting the Japanese catch their own fish in Alaskan waters, charging them a tax on every dog salmon caught, and stipulating that no other kind of salmon be taken. There would be no trouble over this, as the habitat, etc., of the dog salmon is well known, and further, as they always run by themselves and do not mingle with sockeyes, king salmon and other high grade fish.

Dog salmon, outside of the Japanese market, have little, if any, commercial value in Alaska. They are not fit for canning purposes and at present are only caught for this market. As above stated, this will cease if the Japanese obtain the fishing rights which they expect from the Russians, but if Japanese were permitted to catch their own dog salmon in Alaskan waters there is no reason why they should not pay a tax of about 5 cents gold on each salmon caught, bringing in an annual revenue to the Alaskan territorial government of from \$50,000 to \$75,000.’

The consul believes that the present law should be changed for the reason that the sole market for Alaskan dog salmon lies in Japan and, inasmuch as the Russian fishery rights conceded by the treaty of Portsmouth are very problematical, a vast increase in the trade would be effected by complying with Japanese requirements for free entry. On the other hand, a royalty might be obtained by way of a tax on every dog salmon caught and stipulating that no other kind of salmon be taken.

The dog salmon industry in British Columbia, is, however, largely carried on by the Japanese themselves, who capture the salmon under license, and cure and prepare them according to their own methods.

Quinnat or spring salmon, cohoes, steelheads, &c., are also shipped frozen, smoked and variously prepared; indeed one firm is known to have sent 150 to 200 tons each season to the German, French and other European markets.

The methods of fishing legally permitted in the province are few. Drift or gill-nets of a prescribed mesh, purse and drag seines, and in a restricted stretch of coast, viz., from Victoria west along the shore of Vancouver Island, the staked trap-nets are licensed; but the use of traps was until recently prohibited and, in the permanent interest of the salmon supply, they are not permitted generally by the Dominion government, in whose hands the supreme jurisdiction rests. Enormous catches are at times made in salmon traps especially when there are big runs, no less than 340,000 salmon being taken by one trap of the Pacific American Fisheries Co., in Puget Sound in 1905. There is, however, great uncertainty in the working of salmon traps.

6-7 EDWARD VII., A. 1907

While the drift-nets are simply a hang net suspended from a line of corks or wooden floats, and attached at one end to the small row-boat of the gill-net fishermen, the trap-net is a much more costly and elaborate affair. The gill-net varies from 50 to 75 or even 100 or 110 meshes in depth, and is 150 to 300 fathoms in length, the mesh as defined by law being $5\frac{3}{4}$ to 7 inches in extension measure. The trap-net consists of a 'lead' or wall of net fixed to massive piles running out from shore 400 or 500 fathoms. It leads the fish into a terminal inclosure, the 'heart' the entrance being a narrow door or slit on each side of the 'lead.' A cone shaped 'tunnel' leads from the heart into the 'pot' or final trap, so that the fish passing through this horizontal funnel have no means of returning. Alongside the pot is a further quadrilateral inclosure called the 'spiller' into which the fish are admitted when the pot becomes filled and crowded with fish. In a 'big run' the pot has been known to become so packed with living salmon, that the sheer weight of the uppermost fish crushed and killed those on the bottom of the net. It is said that some catches in Puget Sound were so enormous that the bottom could not be raised and the 'brailer' or seine-like web passed beneath the fish in the pot and raised by means of a winch, could not be used. The pot had to be cut out and towed to the cannery. Traps cost from \$5,000 to \$15,000 or even \$20,000 and in British Columbia, only 2 operated in 1904, 16 in 1905, and in 1906, 26 locations were licensed.

HALIBUT.

The halibut of British Columbia have an enviable repute. If not quite equal in whiteness and firmness to the Icelandic and North Sea fish, they are less overgrown and of finer texture. They do not reach the dimensions of European halibut, a length of five to six feet and weight of 250 pounds being exceptional, whereas much larger examples are common in the German ocean and are in great demand in the London markets. The waters between Queen Charlotte Island and the mainland, especially off Rose Spit, and off the west shore of Banks Island, were at one time veritably overcrowded with halibut. They literally 'paved' the bottom of the sea, indeed in 1893 an experienced fisherman informed me that the tug on which he was employed, secured 180,000 pounds of fine halibut in the short space of seven hours. Many fish were rejected owing to small size or, on the other hand, excessive dimensions. Some of the halibut weighed 140 lbs. and so crowded were the waters fished that the baited hooks scarcely reached the bottom before the fish took them. As a rule the sides of the fishing tugs had to be built up with boards in order to retain the excessive catches so easily and rapidly made. The halibut are scattered all over the straits, but regular migrations have been noticed, and where the waters of Dixon Entrance meet the currents, moving from the south through Hecate Straits, and food appears abundant, the fish thickly congregate there. The fish often move into very shallow water, and far up the deep inlets such as Gardner, Bute, and other inlets, the Indians from time immemorial have been in the habit of taking them. Along the west shore of Vancouver Island, halibut are plentiful, indeed, in the coast waters of the province generally these esteemed fish are captured. Further north in the Alaskan waters halibut occur, but in diminished numbers, while the once prolific areas northwest of Cape Flattery have long been 'played out,' a few small sailing vessels from Seattle still, however, obtaining catches there. Besides the fleet of New England Fishing Company's halibut tugs, there are a number of independent steamers engaged in halibut fishing, and operated by Canadian firms, one, the *Celestial Empire* being the first to use the otter trawl; but the *Flamingo* also operates that very effective form of net.

The steam vessels 130 to 150 feet in length which resort to the northern banks have 10 to 14 dories, each carrying two men, and these fish within a radius of seven or eight miles. From 7,000 to 10,000 lines of 'trawls' are used and the snoods are from three to six feet long, and salt or fresh herring is the bait mainly used. From the middle of September to the middle of March is the principal fishing period, but in May and early June many large halibut move into inshore shallows, especially on the east side of Graham Island. There the Indians have long been accustomed to take them. The New England Fish Company has received special concessions from the Dominion

SESSIONAL PAPER No. 22

government and are the principal halibut fishing firm operating in British Columbia waters. These concessions, for which any foreign company is eligible, include permission to land and tranship in bond, through Canada to the United States, catches of fish caught in U. S. bottoms, and to purchase ice and supplies under rules laid down by the Hon. the Minister of Customs of Canada. Certain provincial firms also take part, and vessels from Seattle, Tacoma, etc., exploit the halibut banks. Boats of 60 or 70 tons propelled by motor power 50 or 60 HP. are coming into use, facilitating quick trips to the fishing grounds and back to the Puget Sound markets. The annual catch is officially valued at about \$500,000, but this does not include halibut locally smoked, cured, etc. In spite of rumours that the banks are being destroyed, there is much evidence that the halibut are still more plentiful than on any other grounds in the world, and if some wise protection can be devised to prevent the destruction of fish at the spawning time, the industry has still a great future before it. Though the original abundance of the halibut has been reduced by excessive fishing yet single vessels during the past season have taken from 80,000 to 130,000 pounds of halibut in a single day; indeed about the middle of August last the new halibut steamer *Manhattan* built in the United States for the New England Fishing Company secured the largest single catch recently recorded viz.: 170,000 lbs. of halibut, or 10,000 lbs. more than the steamer *New England* which about the same date brought down 160,000 lbs. of halibut. Most of these fish, indeed all the best catches are made at that time of the year near Goose Island between Princess Royal Island and Queen Charlotte Sound, and no great distance from shore. Certain steam halibut vessels are known to have cleared in one season \$80,000 after paying the expenses of the several trips, and the catches after being shipped east would yield even larger returns to the wholesale and retail dealers. Reliable estimates put the annual catch of halibut in British Columbia waters at 20,000 to 25,000 tons in recent years, or nearly ten times the total weight of fresh water fish caught in Lake Winnipeg in a single year.

The incoming of vast numbers of settlers into the Northwest provinces, and the growth of new towns and settlements east and west of the Rocky mountains is already creating a market of great proportions for Pacific sea fishes. Fresh halibut will soon be in large demand there: but other methods of sending these fish into markets can be adopted. Halibut, codfish and other Pacific fish products are readily canned, smoked, &c., and certain Seattle fish firms are developing a business on these lines. New enterprises of this nature are capable of rapid growth in British Columbia.

BLACK COD OR SKILL.

The black cod (*Anoplopoma fimbria*) abounds in the northern waters of the province, especially along the western shores of Queen Charlotte Islands. It favours deep water especially depths of from 70 to 90 fathoms, though it is found at depths of 200 to 250 fathoms. It is never caught in the surface waters and avoids shallows. The native Indians have long fished for this species in November and, again, in March and April, but it may be taken in other months though the Indians have not taken it at other times, being in December and the New Year season too much occupied with feasts and conviviality even if stormy weather did not prevent fishing operations then, while the salmon fishery, etc., occupied them at other times.

The black cod is a most delicious food fish, of firm and flaky texture, while it is white in colour and rich in flavour. It is flaky like the haddock, but richer in oil. Owing to this rich, oily character it is far more appetising than the drier and firmer true cod. It has been compared to the mackerel though not very appropriately, but is related to and indeed bears some resemblance on the table to the large whiting, *i.e.*, the true European whiting (*Gadus merlangus*) a fish wholly differing from the inferior, so-called whiting of our western waters.

The mouth of the black cod is tender, and to hook it successfully demands care. Very long lines are used, each line carrying 120 to 150 hooks fixed on snoods at regular intervals. The total cost of the fishing outfit does not exceed \$30 or \$40. Herring are the principal bait used, but the cuttlefish or squid, cut in small pieces, is far superior,

being a more consistent and lasting lure. The boats used are of the ordinary Columbia type carrying two men and, in case of the Indians, their wives usually accompany them. In curing the fish it is usual to cut off the head and tail, remove the backbone and salt and split the fish. Experiments have been made in bottling and in canning these fish with good results, but ordinary salt-pickle has not on the whole been successful and when put up after the manner of salt cod the fish 'rust' as a rule, while very strong pickle spoils their edible qualities. They are very apt to turn rancid when lightly salted, though some samples sent in a chilled condition to the east were pronounced very good. The most successful method has proved to be 'double' pickle; that is after pickling once, the fish are taken out and pickled a second time for from two to five days. The second pickle is boiled and the fish are replaced in that fluid after it has cooled and then shipped to market. Such fish have been in great demand where sample shipments have been tested.

OULACHON.

That the oulachon has not become a recognized fish in the best markets is a matter of surprise to most people who have learned to appreciate its rich and palatable qualities. It is a small fish, about the size of the smelt, and from the Naas river in the north to the Fraser river in the south, it occurs in great abundance from early in March to the middle of April. The schools entering the northern estuaries, especially the Naas, are incredibly vast. They crowd in so thickly that the Indians from an early period have been accustomed to make large catches by a very rude and, at first glance, inadequate method. Taking a pole about 10 feet in length, they insert nails, set about an inch and a half apart, and projecting like the teeth of a comb. Putting this implement over the side of his canoe, the Indian draws the pole quickly through the dense school of moving oulachon, and with a backward sweep, impales a number of the fish, which he shakes off the sharp teeth into the canoe and then repeats the operation. In two or three hours it is usual to secure in this simple fashion a boatload of these esteemed fish. Seines are in some localities used and small meshed gill-nets.

Like the smelt, the oulachon soon loses its delicate flavour, and when cooked and canned the flesh drops from the bones, so that it presents, when the can is opened, a jumbled, uninviting appearance. In a freshly caught condition it is a most delicious fish, and when salted, or rather pickled, it is after boiling, a very toothsome article of diet, being most digestible and nutritious. Indeed the flesh of the oulachon is stated to be as restorative to the wasted human system as cod-liver oil. Related as the oulachon is to the trout and salmon it has few bones and the flesh is solid and flaky. When cooked the flesh is easily removed by passing a fork along each side of the backbone and on that account it is more convenient for table use than most small fishes.

The oil, which is so abundant in the tissues of the oulachon, has very superior qualities and might be made commercially important. The flesh is so permeated with the oil that it is commonly called the candle fish, and by simply inserting a piece of pith through the axis of the fish, when dried, it may be used as a candle or torch, the pith burning like the wick of a well-filled lamp. The Indians merely press vast numbers of the fish into a wooden vat or barrel and allow the oil to ooze out by sheer pressure. It rapidly turns rancid and is most offensive in odour, but is highly relished by the Indians all along the British Columbia coast. Oulachon oil is a universally esteemed condiment. The Haida Indians who are unable to secure supplies of this fish on Queen Charlotte Islands are accustomed to cross over to the Naas and Skeena rivers, where they barter their halibut and other products for the much-prized oil. The oil is consumed with seaweed, berries, dried fish-roe, and, indeed, with every form of food. White settlers who have lived long upon the coast acquire a relish for this crude oil preparation, but a refined and clarified oil would be an attractive and merchantable article, if it were placed upon the market.

When the enormous schools of migrating oulachon crowd in solid masses into narrow estuaries to reach their spawning resorts, a short distance up from open sea, they are destroyed by every imaginable enemy, seals, porpoises, sea-birds, even bears and land

SESSIONAL PAPER No. 22

animals join in the destruction. I have repeatedly found huge sturgeon whose stomachs were packed with partly digested oulachon.

No doubt some satisfactory method of preserving these delicate and esteemed fish will be soon found, and a new and remunerative industry would rapidly develop, while the oil would stimulate a demand owing to its medicinal properties.

SMELT.

Of the two species of smelts found in British Columbia waters little use has been made apart from limited captures, for the local markets. Both species (*Osmerus thaleichthys* and *Hypomesus pretiosus*) are plentiful in the fall and early months of the year. They are taken by means of small mesh drag seines in numerous estuaries and inlets, and a smelt industry could be rapidly developed by more systematic and business-like methods. The annual value of the smelt fishery is officially estimated at about \$20,000 as compared with an annual value of \$500,000 or \$600,000 on the Atlantic coast of Canada. Inspector C. B. Sword recently pointed out in a report, regarding the smelt: 'As yet there has been no attempt to any extent to find a market for these fish abroad, and the figures given represent merely the local consumption * * * It can only be a question of time before, by shipping them in some form which will retain their flavour, a large and profitable export business will be carried on in them.'

There is a great opening in the Orient for dried smelts, and some United States firms have already pickled and dried large quantities, and a cured smelt industry is likely to assume large dimensions.

HERRING.

Herring are caught on every part of the British Columbia coast. Those in the more southerly areas, while incredibly plentiful, are of smaller size than the less abundant schools of the north, where the herring reach a size almost equalling the large Labrador herring. In the Straits of Georgia the schools in certain months of the year, usually the fall, may extend for many miles. Indeed in 1893 I was informed that a small tug passed for three hours through a continuous mass of migrating herring in the month of June, while I myself have seen in February dead herring thickly covering the surface of the sea near Nanaimo for a distance of over two miles. Purse seines of 1-inch extension measure were tried 14 or 15 years ago in March and April with considerable success. There seems to be little doubt, that, if the movements of the schools could be ascertained as, indeed, is possible only by an accurate scientific survey, herring could be captured in enormous quantities during the whole year as in Scottish and English waters. Until the present time, the fishermen have been content to await the arrival of the herring in the bays and inlets usually frequented by them at the close of the year and in the New Year. The principal centre of the fishery is Nanaimo and the vast schools, as a rule, move in about the middle of November. As an illustration I quote from a local journal of November 15 last the following:

'The patience of local fishermen was amply rewarded to night when the first shoal herring came rushing into the harbour in a perfect tempest of fright seeking shelter from the school of whales following them, spouting and blowing like porpoises. Immediately a large fleet of fishing boats put off and cast the nets as the herring swept around Protection island, as they had been on lookout night and day for the past ten days for the first run. By eleven o'clock the first cast had been hauled in and placed in casks totalling ten tons. The fishermen estimate that to-night's catch will reach twenty-five tons. To-night's run is only a slight corner of the immense quantity that will now visit the harbour daily.'

Until five or six years ago the herring apart from a very small local demand were practically unutilized, excepting for bait and for guano. The Indians collected quantities of herring spawn which they dried and used for food called 'skoe' (pronounced 'skir'), and, indeed, adopted the device of placing cedar boughs on the shallow spawning grounds, and to these boughs the herring attached their glutinous ova. A few Scottish fishermen are stated to have used herring drift or gill-nets in the open waters

6-7 EDWARD VII., A. 1907

of Queen Charlotte Sound and the Straits of Georgia and to have taken a fine quality of herring in the month of August. The herring which crowd into shallow bays and estuaries are as a rule deteriorated. At any rate the first captures are the best in quality, and in the future no doubt steam herring drifters will be used as on the British coast. In my special report on Canadian herring curing, I pointed out that in order to produce a good cured herring it was necessary to take the herring at the proper time when in best condition. The most esteemed herring are the so-called matties or 'matjes', in which the roe and milt are only partly developed, while the 'full' herring with the roe large and fully formed, but not fat, are also in great request. The thin, spawned, or 'shotten' herring is of far inferior grade and it is these fish which have been hitherto largely taken in British Columbia.

There are many methods of putting up herring, but the greatest demand is for salted herring in pickle—these being mainly used by Germans, Russians and other peoples on the continent of Europe, who prefer to eat them raw with accompanying vegetables. Red herring, the deeply coloured, highly-smoked kind; bloaters, a dry lightly cured and very slightly smoked herring which will keep only a few days; kippers, a split well smoked variety which should be eaten within 8 or 10 days, and boneless herring, an industry developed recently on the coast of Maine, and demanding over 500 tons of herring per week after the close in the fall of the so-called sardine canning operations. These variously prepared herring if placed on the markets would create an immediate demand. There is also a good demand for canned herring, of which a large quantity is annually imported into Canada from Britain, but possibly on account of labour conditions, the establishment of a canned herring industry on a paying basis may not be possible.

At my suggestion the Dominion government has carried out an important experiment with a view to proving that the Pacific herring are not inferior to other herring for market purposes, and with the object, no less important, of improving the method of putting up pickled herring. Earnest efforts have been made at Nanaimo and other places to establish a cured herring industry during the last five or six years. Partial success only has resulted as the pickled fish packed in most excellent barrels brought as a rule \$4 per barrel, whereas Scottish and Norwegian herring sold in the same markets for \$11 to \$12. A Scottish expert, with a staff of fisher girls who gut, select and pack the fish, and coopers who attend to the barrelling, have recently been at work and the sample shipment of Scottish-cured British Columbia herring will compare with any herring in the world. This experiment will be followed up. Already three or four enterprises, backed up with adequate capital, will embark immediately in the business on Scottish lines. There is no reason why the province should not put up as large a pack of the best herring as Scotland, which yields annually 250,000 to 350,000 tons of herring, valued, when pickled and ready for market, at no less than \$5,000,000 to \$6,000,000 per annum. The Scottish staff also prepared some superior 'kipper' and 'bloaters' herring which sold at 12½c. per lb., but the preparation of kippers and well-smoked bloaters has been carried on for some time by several British Columbia firms. Certain bays and inlets on the west coast of Vancouver Island abound in excellent herring, and several lagoons in Queen Charlotte Islands swarm with immense schools, and in all these various localities herring factories are to be established. Apart from the 'pickled' herring business and the smoked herring and bloater trade a very extensive trade has grown up in dry-salted herring. In 1903 no less than 793 tons of these dry salt-cured fish were put up and shipped away by Japanese firms in British Columbia.

STURGEON.

In past times, as at present, salmon formed the staple food of the native coast tribes, but the diet was varied, on the Fraser river, by sturgeon especially in the early spring about the middle of April, or even as early as February, when these fish ascend from the sea. They frequented especially Pitt lake, 30 or 40 miles up the Fraser, and Harrison lake and river, 60 miles up the Fraser, and in the latter area Silver creek was the best fishing ground. There the Indians had been accustomed to catch quanti-

SESSIONAL PAPER No. 22

ties of sturgeon annually by means of trawls, each carrying about a dozen hooks baited with two pounds of salmon steak measuring eight or ten inches across. The spear and torch were also used. Gill-nets of stout twine were, about ten years ago, licensed by the Dominion government, and for three or four years there was quite a boom in sturgeon fishing.

Fish of enormous size were taken, some being stated to exceed 1,100 pounds in weight, while specimens ranging from 700 to 900 or 1,000 pounds were secured in numbers. The maximum catch was made in 1897, when a total amount of 1,137,696 pounds was shipped into the market, its value being not less than \$50,000, apart from the valuable caviare of which, however, British Columbia sturgeon have not been found to be very productive. The fish were not only taken when migrating up the river, but remarkably large catches were made in Pitt lake. So remunerative was the fishing that a large body of fishermen immediately engaged in it, with the result in three years the catch fell to one-fifth of the amount above stated. At the present time not more than 30,000 to 40,000 pounds of sturgeon are annually taken, or about twice the amount of the total Columbia river catch. Vast numbers of small sturgeon are seen by the Fraser river salmon fishermen, hence with the enforcement of the present Canadian regulations the fishery will, in due time, be restored.

The movements of the sturgeon appear to be erratic, for in February, 1895, when the smelt came up the Fraser, the schools of sturgeon followed them as far as Harrison lake, and then apparently satiated with food they descended again. The highest sturgeon gill-nets at that time secured the first fish, and later the nets lower down began to take sturgeon.

Oulachon are a favourite food and attract the schools of sturgeon in April, but they appear to devour other small fish, as one specimen I examined (500 pounds weight) had about a bushel of chub and small fish in its stomach. Parties affirm that such small fish are often found alive inside the sturgeon. I have also found the stomach distended with hundreds of oulachon and smelts. They mainly feed on the offal thrown out by the salmon canneries, heads and tails been greedily swallowed, but one sturgeon in October contained six fine coho salmon.

CULTUS²COD, RED COD OR ROCK BASS, WHITING, ETC.

A number of edible fishes abound along the rocky shores of the province, but are chiefly used to supply the local markets. The cultus cod (*Ophiodon elongatus*) is the principal of these minor fish. It weighs from four to eight or ten pounds and is caught by means of baited hooks and drag seines. The red cod has more the features of a bass than a codfish and in California it is often called black sea bass. Its scientific name is *Sebastes mystinus* and it ranges from three pounds to ten or twelve pounds. Several other bass-like fishes are also largely sold. One species, *Sebastes pinniger*, is generally styled the red rock cod and on the table it is most excellent. The name whiting is given to a species of hake, the merluccio of southern fishermen, and technically called *Merluccius productus*, but it does not rank high although salted and cured, it is in demand, and compares well with the Atlantic hake. The hake industry is, indeed, developing rapidly.

Flat fishes of kinds most acceptable for table use abound on all parts of the Canadian coast of the Pacific, and the recent use of the otter trawl in Queen Charlotte Sound, and further north, has revealed banks crowded with splendid fish called 'plaice,' 'sole,' &c., by the fishermen. Often five tons of these fish are killed along with one ton of halibut; but there being no market for them they are usually dumped overboard, and the halibut alone retained. A demand for these fine delicately flavoured flat fish can no doubt be created and this waste of good food avoided. The experimental use of poke nets or 'sparling' nets in the Straits of Georgia this season will also lead to the capture of new food fishes and the development of new industries.

PILCHARD, ANCHOVY AND SHAD.

These three valuable species occur more or less abundantly in southern British Columbia waters. The first named is caught along with the herring on the eastern and western shores of Vancouver Island and it is said to be very numerous in Barkley Sound, and adjacent inlets. In its small immature stages it is the 'sardine' of France, and investigations on the Pacific coast would reveal the resorts of these fish, and render possible a canned sardine industry whose products could successfully compete with the greatly esteemed European product. That the true anchovy is a British Columbia fish, has long been known. I obtained specimens myself in Burrard Inlet 12 years ago, but the migrations of this valuable species are at present unknown. Once ascertained, the British Columbia anchovy could be prepared as a paste, and supply the markets, which at present are supplied by the Mediterranean. Of the shad it is unnecessary to say much. The shad caught each season by British Columbia fishermen are the result of fry planted further south by the United States Fish Commission. That the waters of the province are favourable for these fish is proved and artificial culture would aid in establishing a supply permanently, and insuring a remunerative shad fishery.

TROUT AND WHITEFISH.

Of the various species of trout (spotted or cut-throat, rainbow, Dolly Varden and lake trout) inhabiting the British Columbia rivers, the first-named is alone of any commercial moment, between 300,000 and 400,000 pounds (nearly \$40,000 in value) being annually marketed. They vary in quality in different rivers up which a great proportion of them migrate. Thus the Nimpkish spotted trout cannot be surpassed, while those of the Naas and the Fraser are much inferior.

The interior lakes and rivers furnish the purely fresh-water kinds of trout, chiefly of value for sporting purposes, but the whitefish (Williamson's whitefish *Coregonus quadrilateralis*) occurs in most waters distant from the sea, and like the large lake trout (*C. namaycush*) is netted under Dominion license. A dwarfed sockeye or red salmon also abounds in some lakes but does not descend to the sea, and is used locally for food.

SHELL-FISH.

The value of shell-fish marketed annually in the province exceeds \$50,000, but it could be easily quadrupled. The delicious small Olympia oyster occurs on every suitable shallow flat in the Straits of Georgia and around Vancouver Island, and many leases were granted by the Federal government which required the lessees to protect and cultivate the mollusks. A large species comparable to the Atlantic oyster does not occur, the alleged specimens, hitherto secured, being valueless and inedible shell-fish. In some localities, however, a large variety of the Olympia oyster occurs. Eastern oysters have been planted on many occasions, but with more or less favourable results. The valuable Abalone or ear-shell (*Haliotis*) is very plentiful in many districts, especially around Queen Charlotte Island, and considerable fisheries have been developed. Clams, of several varieties, are also fished, and there are few sandy or muddy areas where these esteemed species are not exceedingly abundant. Canneries for preserving clams are already in operation, and others in progress, so that an extensive clam industry is rapidly developing.

CRABS, SHRIMPS AND PRAWNS.

Fine crabs are universally met with on the rocky shores of the province, and in the north, especially off Queen Charlotte Islands, very large examples abound. Quantities are taken for local consumption, and during the last ten years several parties have canned small quantities, but the industry has never reached large dimensions. Prawns and shrimps are taken in all the harbours, but the true lobster does not occur, though twice the Dominion government has transplanted a quantity from the Atlantic. Occasionally the spiny-lobster or crawfish (not the fresh-water crawfish) has been taken near

SESSIONAL PAPER No. 22

Victoria. It may possibly be plentiful, but no means have been taken to create a commercial fishery for it.

WHALES.

Many species of whales occur off the British Columbia coast, both whalebone and toothed whales. Occasionally sperm whales have been noticed, four, two males and two females, having been captured by the steamer of the Sechart Whaling Station during the past twelve months, the last caught in September was a gigantic specimen yielding nearly 170 barrels of oil, but the finners and sulphur-bottoms and humpbacks and blackfish or killers are the principal kinds. Some of these monsters exceed 100 feet in length, and one was observed this fall which was estimated to reach a length of 110 feet. Hitherto the schools of whales have been of no value to the province whatever, but the action of the Dominion government, by its encouragement of whale factories on modern principles, will create in a few years a vast and remunerative industry all along the coast. A trip from Victoria to the Naas river suffices to show how plentiful these valuable creatures are, as whales may be seen 'blowing' in schools of two to twenty individuals, all the way from the Straits of Georgia, north. Numerous factory sites have already been secured, and one whaling station has commenced operations at the entrance to Barkley Sound, Vancouver Island.

Nearly 250 whales, chiefly humpbacks and sulphur bottoms, have been captured in less than a year, some months (such as September) showing a record of over 50 whales killed. One of these whales will yield on an average 50 to 80 barrels of oil, and $4\frac{1}{2}$ to 5 tons of dried guano, the oil bringing 30 to 40 cents per gallon, though the market fluctuates considerably and sperm oil is quoted at from 50 cents to 70 cents per gallon, while guano sells at \$25 to \$30 or more per ton. If the Pacific gray whale, one of the valuable 'right' whales, still survives in British Columbia waters, though exterminated some years ago off the California coast, an excessively remunerative industry is certain to grow rapidly. As it is, the whales, known to exist, furnish numerous important products when treated by the most recent mechanical and chemical methods. Oil, fertilizer, leather, glue, canned 'beef,' which is really prepared whale-flesh put up in beef cans, and even condensed milk from the female whale, are among the articles yielded by these creatures.

Pickled whales' tails are regarded with favour in Japan, and the large tail flukes, salted, have been shipped from Sechart, 40 barrels of them being sent about the middle of September.

The New York *Fishing Gazette* (Sept. 22, 1906) says of the whale meat market in the Orient:—Most of the whale meat consumed in Japan comes from Corea. The supply is limited and prices rule fairly high. It is consequently probable that before long British Columbia, where the catch is so great that whale flesh is even used as manure, may attempt to supply the Japan market with part of its enormous surplus. The idea seems a feasible one, reports the British consul at Nagasaki, though whaling is rapidly developing on modern lines in Japan, seven Norwegian whale steamers being already at work in Korea and north-east Japan, the industry only extending along those shores within the last twelve months. With the establishment of stations on the Japanese eastern coast the fleets are being augmented. It has been found that one steam whaler is sufficient to feed a single station, and when two new steamers from Christiania—the *Lightning* and the *Thunder*—reach their destination there will be in all nine stations—five on the Korean coast and four on the northeastern coast of Japan, the best whaling stations being off Sendai to the further north. The station to which Captain Oleson has been attached is at Chusai, 140 miles north of Yokohama. The harbours are poor in that locality, and it is necessary to tow the whalers brought in up the river by sampans to the stations. The whales, too, are more wary than those in British Columbia waters, which have not yet been so sharply hunted. Here on the Pacific coast harpoons can be fired from as near as seven or eight fathoms from the whale. In Japanese waters it is frequently necessary to shoot from 35 fathoms distance, with much less chance of killing the whale. Yet, as an evidence of the success of these new whaling ventures, one steamer in 1905 secured no less than 154 sulphur bottom whales

6-7 EDWARD VII., A. 1907

in the Japanese waters referred to. Whalebone, ambergris, spermaceti and similar materials, will also add to the substantial profits which the newly organized whaling companies will without doubt secure.

DOGFISH, RATFISH, ETC.

For over twenty years oil from these fishes has been prepared in a desultory manner, at two or three "oileries" at Skidegate, Queen Charlotte Island, and other places, but several projects are now on foot for fully utilizing, as guano, fish-glue, etc., other products yielded by the sharks, dogfish and ratfish. The oil of the ratfish is especially valuable medicinally, and for preserving firearms, and the most recent extracting and cooking and drying machinery is being adopted, so that the present value of fish oil in the province, viz., about \$100,000, will be doubled or trebled without difficulty. The canning of dogfish has been successfully tried in eastern Canada this year and the flesh when properly packed is by no means to be despised.

FISH OFFAL.

The fish waste from the canneries and halibut fisheries, has hitherto been practically unutilized. Several fish fertilizer factories have operated on the Fraser river and further north, but the immense quantity of 'gurry' annually produced has never been effectively treated. More than 1,000 tons of fish guano are produced, at present, each season, valued at nearly \$32,000. The Dominion government last year voted \$10,000 as a guarantee to parties against loss, if the Fraser river offal were utilized by them, and the development of guano production on a large scale is being carried out at the present time. Certain Japanese and other firms captured herring in immense quantities, but as the use of food fish for manure is discouraged in Canada that branch of the fertilizer industry collapsed a year ago. The herring taken at Nanaimo for guano sold for \$3.50 per ton f. o. b. on the scows, whereas the same quantity of fresh herring, cured and barrelled for the pickled fish markets, would realize \$40 to \$80 or even \$100 per ton. Apart from herring, there remain vast quantities of non-edible fish and much fish offal, which offer an opportunity by modern mechanical methods of successful exploitation.

In this brief and hasty review of the various lines; upon which the fishing industries of the Pacific waters of the Dominion are pursued, no reference is made to the sealing, sea otter, and similar marine industries, partly because they are not strictly speaking, fishing enterprises at all and partly because, as compared with the salmon, halibut, herring, and other industries, they are of much inferior value. In the total value of the British Columbia fishing industries (nearly \$9,850,000) they show a value in 1905 of about \$331,152. The signs of rapid development, as indicated in the foregoing sketch are unmistakable and in a very few years the British Columbia fisheries should double their present annual money returns.

APPENDIX No. 1.

FISHING BOUNTIES.

The payments made for this service are under the authority of Act 54-55 Vic., cap. 42, intituled : ' An Act to encourage the development of the sea fisheries and the building of fishing vessels,' which provides for the payment of the sum of \$160,000 annually, under regulations to be made from time to time by the Governor General in Council.

REGULATIONS.

The regulations governing the payment of fishing bounties are as established by the following Order in Council, dated December 10, 1897 :—

Order in Council.

AT THE GOVERNMENT HOUSE AT OTTAWA,

FRIDAY, the 10th day of December, 1897.

Present :

HIS EXCELLENCY THE GOVERNOR GENERAL IN COUNCIL.

His Excellency, in virtue of the provisions of 'The Bounty Act, 1891', 54-55 Victoria, chapter 42, and by and with the advice of the Queen's Privy Council for Canada, is pleased to order that the regulations governing the payment of fishing bounties established by order of the Governor in Council, dated the 24th August, 1894, shall be and the same are hereby rescinded, and the following regulations substituted therefor :—

1. Resident Canadian fishermen who have been engaged in deep sea fishing for fish other than shell-fish, salmon and shad, or fish taken in rivers, or mouths of rivers, for at least three months, and have caught not less than 2,500 pounds of sea-fish shall be entitled to a bounty ; provided always, that no bounty shall be paid to men fishing in boats measuring less than 13 feet keel, and not more than 3 men (the owner included), will be allowed as claimants in boats under 20 feet.

2. No bounty shall be paid upon fish caught in trap-nets, pound-nets and weirs, nor upon the fish caught in gill-nets fished by persons who are pursuing other occupations than fishing, and who devote merely an hour or two daily to fishing these nets but are not, as fishermen, steadily engaged in fishing.

3. Only one claim will be allowed in each season, even though the claimant may have fished in two vessels, or in a vessel and a boat, or in two boats.

4. The owners of boats measuring not less than 13 feet keel which have been engaged during a period of not less than three months in deep-sea fishing for fish other than shell-fish, salmon or shad, or fish taken in rivers or mouths of rivers, shall be entitled to a bounty on each such boat.

5. Canadian registered vessels, owned and fitted out in Canada, of 10 tons and upwards (up to 80 tons) which have been exclusively engaged during a period of not less than three months in the catch of sea-fish other than shell-fish, salmon or shad, or fish

6-7 EDWARD VII., A. 1907

taken in rivers, or mouths of rivers, shall be entitled to a bounty to be calculated on the registered tonnage which shall be paid to the owner or owners.

6. The three months during which a vessel must have been engaged in fishing, to be entitled to bounty, shall commence on the day the vessel sails from port on her fishing voyage and end the day she returns to port from said voyage.

7. Owners or masters of vessels intending to fish and claim bounty on their vessels must, before proceeding on a fishing voyage, procure a license from the nearest Collector of Customs or Fishery Overseer, said license to be attached to the claim when sent in for payment.

8. Dates and localities of fishing must be stated in the claim, as well as the quantity and kinds of sea-fish caught.

9. Ages of men must be given. Boys under 14 years of age are not eligible as claimants.

10. Claims must be sworn to as true and correct in all their particulars.

11. Claims must be filed on or before November 30 in each year.

12. Officers authorized to receive claims will supply the requisite blanks free of charge, and after certifying the same will transmit them to the Department of Marine and Fisheries.

13. No claim in which an error has been made by the claimant or claimants shall be amended after it has been signed and sworn to as correct.

14. Any person or persons detected making returns that are false or fraudulent in any particular will be debarred from any further participation in the bounty, and be prosecuted according to the utmost rigour of the law.

15. The amount of the bounty to be paid to fishermen and owners of boats and vessels will be fixed from time to time by the Governor in Council.

16. All vessels fishing under bounty license are required to carry a distinguishing flag, which must be shown at all times during the fishing voyage at the main-topmast head. The flag must be four feet square in equal parts of red and white, joined diagonally from corner to corner. Any case of neglect to carry out this regulation reported to the Department of Marine and Fisheries will entail the loss of the bounty, unless satisfactory reasons are given for its non-compliance.

JOHN J. MCGEE,

Clerk of the Privy Council.

The bounty for the year 1905 was distributed on the basis authorized by the following Order in Council, approved by the Governor General on the 26th January, 1906.

On a Memorandum dated 20th January, 1906, from the Acting Minister of Marine and Fisheries, recommending that the sum of one hundred and sixty thousand dollars, payable under the provisions of the Act 54-55 Victoria, cap. 42, intituled: 'An Act to amend chapter 96 of the Revised Statutes, intituled: "An Act to encourage the development of the Sea Fisheries and the building of fishing vessels,"' be distributed for the year 1905-1906 upon the following basis:—

Vessels: The owners of the vessels entitled to receive bounty shall be paid one dollar (\$1) per registered ton, provided, however, that the payment to the owner of any one vessel shall not exceed the sum of eighty dollars (\$80), and all vessel fishermen entitled to receive bounty shall be paid the sum of seven dollars and ten cents (\$7.10) each.

Boats: Fishermen engaged in fishing in boats, who shall also have complied with the regulations entitling them to receive the bounty, shall be paid the sum of three dollars and sixty-five cents (\$3.65) each, and the owners of fishing boats shall be paid one dollar (\$1) per boat.

JOHN J. MCGEE,

Clerk of the Privy Council.

SESSIONAL PAPER No. 22

There were received for the year 1905, 13,186 claims, an increase of 435 as compared with 1904.

The number of claims paid during the year was 13,141, an increase of 470 as compared with the previous year.

There were \$71,502 in bounties paid to vessels and their crews, and \$87,044.65 to boats and boat fishermen, making the total payments during the year 1905, \$158,546.65.

The number of vessels which received bounty during the year was 922, the total tonnage being 25,686 tons, an increase of 68 vessels and a decrease of 4 tons.

During the year bounty was paid on 12,219 boats and to 20,501 boat fishermen, being an increase of 402 boats and 423 men as compared with 1904.

GENERAL STATISTICS.

The fishing bounty was first paid in 1882.

The payments were made each year on the following basis:—

1882, vessels \$2 per ton, one half to the owner and the other half to the crew. Boats at the rate of \$5 per man, one-fifth to the owner and four-fifths to the men.

1883, vessels \$2 per ton, and boats \$2.50 per man, distributed as in 1882.

1884, vessels \$2 per ton, as in 1882 and 1883.

Boats from 14 to 18 feet keel.	\$1 00
“ 18 to 25 “	1 50
“ 25 feet keel upwards	2 00
Boat fishermen	3 00

1885, 1886 and 1887, vessels \$2 per ton as in previous years. Boats measuring 13 feet keel having been admitted in 1885, the rates were:—Boats from 13 to 18 feet keel, \$1; from 18 to 25 feet keel, \$1.50; from 25 feet keel upwards, \$2, and fishermen \$3 each.

1888, vessels \$1.50 per ton, one-half each to owner and crew. Boats, the same as 1885, 1886 and 1887.

1889, 1890 and 1891, vessels \$1.50 per ton as in 1888. Boats \$1 each. Boat fishermen \$3.

1892, vessels \$3 per ton, one-half each to owner and crew. Boats \$1 each. Boat fishermen \$3.

1893, vessels \$2.90 per ton, paid as formerly. Boats \$1 each. Boat fishermen \$3.

1894, vessels \$2.70 per ton, distributed as in previous years. Boats \$1 each. Boat fishermen \$3.

1895, vessels \$2.60 per ton, half each to owner and crew. Boats \$1 each. Boat fishermen \$3.

1896, vessels \$1 per ton, which was paid to the owners, and vessel fishermen \$5 each, clause No. 5 of the regulation having been amended accordingly. Boats \$1 each, and boat fishermen \$3.50 per man.

1897, vessels \$1 per ton, and vessel fishermen \$6 each. Boats \$1 each, and boat fishermen \$3.50 per man.

1898, vessels \$1 per ton, and vessel fishermen \$6.50 each. Boats \$1 each, and boat fishermen \$3.50 per man.

1899, vessels \$1 per ton, and vessel fishermen \$7 each. Boats \$1 each, and boat fishermen \$3.50 per man.

1900, vessels, \$1 per ton, and vessel fishermen \$6.50 each. Boats \$1 each, and boat fishermen \$3.50 per man.

1901, vessels \$1 per ton, and vessel fishermen \$7 each. Boats \$1 each, and boat fishermen \$3.50 per man.

1902, vessels \$1 per ton, and vessel fishermen, \$7.25 each. Boats \$1 each, and boat fishermen \$3.80 per man.

1903, vessels \$1 per ton, and vessel fishermen \$7.30 each. Boats \$1 each, and boat fishermen \$3.90 per man.

1904, vessels \$1 per ton, and vessel fishermen \$7.15 each. Boats \$1 each, and boat fishermen \$3.75 per man.

1905, vessels \$1 per ton, and vessel fishermen \$7.10 each. Boats \$1 each and boat fishermen \$3.65 per man.

Since 1882, 19,653 vessels, totalling a tonnage of 685,030 tons, have received the bounty. The total number of vessel fishermen which received bounty is 149,869, being an average of about 7 men per vessel.

The total number of boats to which bounty was paid since 1882 is 324,256, and the number of fishermen 592,155. Average number of men per boat 2.

The highest bounty paid per head to vessel fishermen was \$21.75 in 1893; the lowest 83 cents, while the highest to boat fishermen was \$4, the lowest \$2.

The general average paid per head is \$5.11.

SESSIONAL PAPER No. 22

COMPARATIVE STATEMENT by Provinces for the Years 1882 to 1905, inclusive, showing:—
 (1) Total number of Fishing Bounty Claims received and paid by the Department of Marine and Fisheries.

YEAR.	NOVA SCOTIA.		NEW BRUNSWICK.		P. E. ISLAND.		QUEBEC.		TOTAL.

SESSIONAL PAPER No. 22

APPENDIX No. 2.

BRITISH COLUMBIA.

REPORT ON THE FISHERIES OF BRITISH COLUMBIA FOR THE SEASON OF 1905, BY INSPECTORS C. B. SWORD, J. T. WILLIAMS AND E. G. TAYLOR.

DISTRICT No. 1.

NEW WESTMINSTER, B.C., April 10, 1906.

To the Dominion Commissioner of Fisheries,
Ottawa.

SIR,—I have the honour to inclose statistics of the fisheries for District No. 1, British Columbia, for the year 1905. These include halibut (none of which are taken in this district) brought into the ports of Vancouver and New Westminster, which have been taken in Districts Nos. 2 and 3, mainly the former.

The salmon pack this year has been very good, 846,998 cases. This is not as much as was put up in 1901, though had the necessary labour in the canneries been obtainable, the 1901 pack might have been not only equalled but exceeded. During the run there were altogether five days in which the canneries had to place the fishermen on the limit (viz., 200 fish in the 24 hours to each boat), being unable to handle more.

This total is made up of 811,340 cases of sockeyes, 5,507 cases of springs, 3,304 cases of humpbacks and 26,847 of cohoes.

It will be observed that the pack this year is almost wholly composed of sockeyes.

In comparing this pack with that of former years, the 26,140 cases put up at Esquimalt (District No. 3) should be taken into account. On Puget Sound the pack was 825,453 cases, practically all Fraser river salmon, so that the pack of these fish for the two countries is just about equal.

In 1901, the Fraser river pack was 984,911 cases and Puget Sound pack 1,106,643 cases.

In explanation of the large increase in the amount of fresh and frozen salmon, this includes 2,000,000 lb. of salmon (mainly sockeye) exported to Puget Sound canneries after the expiration of the annual close season when our own canneries had closed down. The Indian consumption on account of the heavy run is also estimated at a much higher amount than in poor years.

The oil and guano returns are simply those of the Fraser River Oil & Guano Works, as the district as now limited does not cover any dog fishing grounds.

The fish roe, while one-half larger than for the larger district, does not include any herring spawn, there being practically none of this collected by the Indians in this district as now limited, but the increase is accounted for by the larger quantity of the salmon roe available; 13,000 lb. of this was salted and shipped to Japan.

The quantities given for halibut are the exact returns given by the New England Fish Company and the Cold Storage Companies; the fish taken by individual fishermen and consumed locally coming into the returns for Districts Nos. 2 and 3.

Nearly all the herring taken, which in former years were brought to Vancouver for bait, would have been entered in the Fraser river returns. These were taken at Nanaimo and come into the statistics of District No. 3. The small quantity given for District No. 1 this year represents the catch in Burrard Inlet, which was trivial. Dis-

6-7 EDWARD VII., A. 1907

trict No. 3 statistics also include 240,320 lb. put up at the Unique Cannery, Fraser river, as 'Dry salted', 'Kippers', 'Bloaters' and 'Digby Chicks.'

It will be seen that the total value of the fisheries for this district shows a large increase over the returns of 1904, although in that year the catch from the greater part of what is now District No. 3 was included. This increase is of course mainly attributable to the canned salmon pack, which is this year ten times the value of that of 1904. The actual pack was between six and seven times that of 1904, but the higher price obtained makes up the difference.

Your obedient servant,

C. B. SWORD,

Inspector of Fisheries.

DISTRICT No. 2.

PORT ESSINGTON, March 25, 1906.

To the Dominion Commissioner of Fisheries,
Ottawa.

SIR,—I have the honour to inclose my annual statistical report of the Fisheries of the Northern coast of British Columbia, District No 2, for the year ending 1905, including statement of salmon packs, of the different canneries.

These returns show a slight increase in the aggregate, the total value of fish and fish products in 1905 being \$2,011,199 against \$1,902,046, in 1904. Although there has been a decrease in the pack of canned salmon in 1905, other branches of the industry have been more fully developed during the year, consequently the loss occurring from the decrease in the salmon pack, has not materially affected the statistical returns.

SALMON.

The total pack of salmon for the district for the season of 1905, is as follows :—

	Cases.
Sockeye	228,232
Cohoe	12,342
Spring	19,864
Humpback	9,411
	<hr/> 269,849
Against in 1904 :—	
	Cases.
Sockeye	243,384
Cohoe	22,840
Spring	24,583
Humpback	31,296
	<hr/> 322,103
Approximate detailed decrease and increase, season 1905.	
	Cases.
Skeena river, decrease	40,000
Rivers Inlet "	11,000
Northern coast "	3,000
Naas river, increase	3,000

With reference to the decrease shown in the aggregate salmon pack in my district for the year 1905, viz., about 50,000 cases, you will notice that 40,000 of this occurs on the Skeena river, and is attributable to several causes. In the first place there were three canneries less in operation than last season, consequently less boats were fishing,

SESSIONAL PAPER No. 22

but undoubtedly there was a smaller and shorter run of sockeye, as the fishermen averaged per boat less last season than in 1904.

I also consider that the immense quantity of snags in the principal drifts acted most detrimentally, and was one of the chief causes of the decrease in the pack, the small snag boat now in operation on the Skeena river is entirely inadequate, in fact is of little use, as she cannot handle the immense snags that accumulate in the principal drifts, not to mention the terrible destruction of nets entailed.

I may also say in this connection that the work of enforcing the fishery regulations on the Upper Skeena, that was authorized by the department, was most successful, the three fishery officers, and Overseer Helgesen, placed a check on this illegal work, which had been proceeding for years, and I am gratified to be able to report that no barricades were constructed during the season, on the spawning grounds of the Upper Skeena, and the illegal sale of dried salmon, that had been on the increase and had almost assumed the importance of an industry, was entirely stopped.

I may call your attention to Overseer Helgesen's long and interesting report on his work in this district, last season, forwarded to the department by me with my deductions and recommendations on January 5, 1906.

I may also say that during last season the department undertook the work of removing the obstructions on the Oxstahl river, a tributary of the Skeena, that had been in existence for a considerable time. These obstructions were removed in sufficient time to enable the sockeye to ascend to their spawning grounds in the lake, and they were seen in thousands spawning in the different streams tributary to this lake, this being the first time in my experience that sockeye have reached these spawning grounds in any quantity, and I consider this will be a valuable acquisition to the area of spawning ground tributary to the Skeena river.

The department have already issued instructions for the removal of the Copper river obstructions, and the work will be proceeded with as soon as climatic conditions are favourable and render the work practicable. This will again open up a vast area of spawning ground which will be tributary to the Skeena river.

I may call the attention of the department to the desirability of erecting a twenty million capacity hatchery on the Upper Skeena, with as little delay as possible, this I consider of the utmost importance.

With reference to Rivers Inlet, I have again to report a magnificent run of sockeye, equalling if not surpassing that of 1904, indeed the run was so heavy at times that the cannerymen were unable to handle the fish, and from the 20th of July to the 27th, there was no fishing at all on the Inlet, owing to the scarcity of cans. I am aware the pack was about 11,000 cases short of 1904, but I attribute this to the fact that the cannerymen not anticipating so heavy a run, and in view of the probable 'big run' on the Fraser, prepared for smaller packs, and when the heavy run arrived they had not sufficient cans and were unable to procure them.

Fishery Officer Nordschow reports that the fishery regulations were observed throughout the season, with very few exceptions, that the spawning grounds on Oweekayno lake were carefully guarded during the fall, and that the Indians in taking their winter supply of food, observed the regulations in every respect.

I consider that up to and during the season of 1905, fishery matters on Rivers Inlet were in the most satisfactory condition.

With regard to the Naas river, I may inform you that the run was good, showing a slight increase in the pack against that of 1904.

Snags are very prevalent in this river and it is desirable to place a small snag boat here for the purpose of keeping the main drifts clear of snags; a very heavy loss is sustained annually by the cannerymen and fishermen. My suggestion relative to this matter was to place the small snag boat now in operation on the Skeena river, on the Naas, when the proposed new one for the Skeena is available.

In September, last year, the department authorized the Reverend McCullough, of Naas River, to make a preliminary survey of the obstruction existing at the head waters of this river, near Magiarden lake, with a view to ascertain the exact conditions existing there, Mr. McCullough made a complete survey of said obstruction, taking photo-

6-7 EDWARD VII., A. 1907

graphs and making sketch plans, estimates and specifications, and provided me with a most able and intelligent report, this I forwarded to the department on March 15, 1905, with my deductions and recommendations.

I consider the removal of this obstruction is of vital importance to the prosperity of the Naas river salmon fisheries, it will open up a vast area of spawning ground which should in a few years materially influence and increase the quantity of sockeye now captured on this river. I trust this important work will be completed during next winter.

With regard to our other northern coast salmon fisheries, there was an average catch last season. These fisheries do not vary much, one can generally forecast the probable catch, and I have no fears for their depletion so long as they are protected and patrolled during the fishing season, they should remain in their present condition indefinitely.

I may inform you that throughout the district the fishery regulations have been rigorously enforced, and, considering the number of licenses issued and the extensive area of water fished, and the number of fishermen of all sorts and nationalities engaged in these operations, there have been very few infringements of the regulations.

Referring to the qualo or dog salmon, I may inform you that there has been a considerable increase, the Japanese when they have finished with the sockeye and coho fishing, now turn their attention to the dog salmon, they have erected five small salteries in different parts of the district, and employ the local Indians to help them catch these fish, which they salt for the Japanese market.

I believe these fisheries in another two years will increase to the proportions of an industry, as the dog salmon abounds in almost inexhaustible quantities in the different rivers and creeks throughout the district.

HALIBUT.

I may inform you that three-quarters of the whole of the British Columbia catch of halibut are caught in District No. 2, but are taken to Vancouver and exported from that port, only a comparatively small quantity being exported direct from my district, therefore the statistical returns are forwarded to the department by Inspector Sword in his report as it has been customary for the port from which the fish are shipped, to make the returns.

I have already drawn up and submitted to the department a draft code of proposed regulations and suggested an amendment to the Fishing by Foreign Vessels Act, and trust that this immensely valuable commercial product will receive the protection of the department, as foreign vessels are undoubtedly rapidly depleting our halibut banks.

OULACHON.

This fish is not receiving the attention it deserves, it can be caught in large quantities during the spring of the year, on all the principal rivers in the district, but with the exception of the Indians, it receives very little attention as a commercial commodity.

MISCELLANEOUS.

With regard to the above I may say that though the waters in my district abound with an almost inexhaustible supply of edible fishes, salmon, halibut, all species of cod, oulachon, herring, &c., the population is so sparse that there is comparatively little fishing outside the salmon and halibut.

In view of the greater interest now being taken in the utilization of our deep sea fisheries, and also in view of the fact that the population of the district is rapidly increasing, and in all probability during the next few years one or more large cities will come into existence, I consider it most desirable that the regulations under which these are to be prosecuted should receive the immediate attention of the department.

I have the honour to be, sir,

Your obedient servant,

JOHN T. WILLIAMS,

Inspector of Fisheries.

SESSIONAL PAPER No. 22

DISTRICT No. 3.

NANAIMO, B.C., April 19, 1906.

To the Dominion Commissioner of Fisheries,
Ottawa.

SIR,—I have the honour to inclose my statistical report of the fisheries for District No. 3, British Columbia, for the year ending December 31, 1905. The returns for this division show a marked increase and the developments in the various branches of our fisheries have been most satisfactory during the past year, especially is this development noticeable in the increased pack of dry salted salmon and in the expansion of the herring industry.

SALMON.

The operation of salmon traps in the Straits of Juan de Fuca has been a very important feature in the salmon industry of this province, and the measure of success that has attended the trap fishing has stimulated the industry to a great extent. The number of traps on the west coast of Vancouver Island would have been much greater if it were not for the fact that this was the year for the large run of salmon to the Fraser river.

All the salmon caught in the traps were taken in barges to the canneries on the Fraser, with the exception of those taken from the traps of Todd & Sons, which supplied their large new cannery at Esquimalt. The salmon shipped from the traps to the Fraser River canneries are included in the statistical returns of Inspector Sword, and so will not appear in my returns. The indications are that next year the number of salmon traps in the Straits of Fuca will be greatly augmented. The Capital City Canning Co. will have a new cannery completed and ready for the next season's operations at Victoria.

I have no doubt that all the companies operating traps on the west coast of Vancouver Island will erect canneries at or near Victoria, as taking the salmon from the traps to the Fraser river canneries by tugs and scows is expensive, they are apt also to deteriorate in quality if taken a long distance.

This was the banner year for the British Columbia Packers Cannery at Alert Bay. They are now beginning to reap the benefit of the hatchery at Nimpkish lake. This year they placed in their hatchery five million and thirty-seven thousand (5,037,000) sockeye eggs.

In my preliminary report I recommended the erection of small hatcheries for the artificial propagation of salmon. I would again emphasize the importance of such an undertaking; the success of the Nimpkish hatchery is an evidence of the wisdom of artificial propagation.

The Clayoquot Canning Co. put up a considerable quantity of spring salmon (mild cured) for the German market. The spring salmon taken in the traps were mild cured at Victoria and shipped to foreign markets. The demand for the spring salmon is growing rapidly and next year a number of new companies will be engaged in the export of this valuable fish.

HERRING.

The operation of the Scottish herring curing staff under the supervision of Mr. J. J. Cowie has given a stimulus to the herring industry from which we will reap the benefit for all time to come.

This is shown in the extensive preparations now going on to handle the herring that annually visit our bays and harbours in such vast shoals. The practical lessons given by Mr. Cowie and his staff will also result in placing upon our market a first-class article.

6-7 EDWARD VII., A. 1907

WHALING.

The whaling station at Barclay Sound is now in full operation, and as sulphur bottoms, humpbacks, and many kinds of smaller whales are abundant all along the coast, this enterprise ought to yield a rich harvest to the promoters. Another whaling station is to be erected farther up the coast at Rose Harbour.

HALIBUT.

The halibut banks in my division extend all along the west coast of Vancouver Island. As they receive very little protection, poaching is carried on to a considerable extent.

It is to be regretted that fishing firms operating in British Columbia do not enter more extensively into the halibut industry.

SEALING.

The Victoria Sealing Co., despatched 18 vessels to the Behring Sea, but one *The Fawn*, was lost with all hands on board. The 17 vessels which returned secured an average catch of 765 skins; last year the average catch of 21 vessels was 626 skins.

A smaller number of Indians were engaged in the sealing along the west coast of Vancouver Island than last year.

PATROL.

Should the large fishing areas in this division receive the attention and protection that their importance demands, it is absolutely necessary that patrol boats should be placed on the east and west coasts of this island.

As the waters between Vancouver Island and the mainland are not exposed to the storms of the Pacific, a small cruiser would do the work required for the east coast.

I have the honour to be, sir,

Your obedient servant,

EDWARD G. TAYLOR,
Inspector of Fisheries.

SESSIONAL PAPER No. 22

STATEMENT

Of the Yield of Fisheries in District No. 1, Southern part of British Columbia, for the Year 1905.

APPENDIX No. 3.

ALBERTA.

ANNUAL REPORT ON THE FISHERIES OF ALBERTA.

EDMONTON, March 17, 1906.

To the Dominion Commissioner of Fisheries,
Ottawa.

SIR,—I have the honour to submit the usual report and statistics of the Fisheries of this district for 1905.

As stated in my preliminary report for the year, the season opened badly for fishermen, the weather being very mild, a good many fish were spoiled for sale to outside markets, but as a rule, the fishermen did not try to fish until conditions were favourable.

Competition for whitefish for shipment, principally for the American market, was very keen, and fishermen realized good prices for their catch, as high as eleven cents apiece being paid at Pigeon lake. Some of the Indian fishermen who had good stations made ten dollars a day. I am sorry to state, however, that the money received did not seem to benefit them much, as Overseer L. Ingraham Wood, of Pigeon Lake, reports to me, that at close of fishing season he visited all camps, and could see no evidence that the occupants had been recipients of large wages nearly all winter.

Starting from Edmonton in October, I drove to Red Deer, thence via Lacombe to Buffalo lake, and then across to Battle river and Dried Meat lake, from there to Wetaskiwin and Pigeon lake, thence back to Edmonton.

I was astounded at the settlement of all the country I passed through, good farm houses and farms well fenced, and the stacks of grain, gave ample evidence of the fertility of the land, and the prosperity of the settlers. I found on this trip many of the large creeks and small rivers, such as Battle river, Pigeon Lake creek, Stony creek and Meeting creek, either very low or altogether dry, I did not see any signs, however, of any fish being stranded in the creeks, all seemed to have found refuge in the lakes where most of the creeks have their sources.

The number of lakes and creeks in this part of the district, all full of running fish in spring, make it a difficult matter to protect them as strictly and efficiently as I would wish. The guardians have done all possible, by breaking up traps and dams, and by clearing creeks of brush and other accumulations to allow the fish to ascend the creeks to spawn. Their work has been of service, as coarse fish are plentiful all over this section of country. The fishing at Buffalo lake was very good, and lasted all winter, which is unusual. This fishing is all done with hook and line. The black bass put in Buffalo lake are supposed to be thriving, it must be some time before they will be numerous, and make a showing in a lake as large as Buffalo lake.

Leaving Edmonton again in end of October, I visited Lake Ste. Annes, and White Whale lake. I found it to be the universal opinion of old residents of Ste. Annes that this lake was now as well stocked as ever with whitefish.

It is to be regretted that as yet no one has been able to make a success of winter fishing in this lake, Guardian Beaupré tried at many places in the lake this past winter but met with very little success.

White Whale lake is becoming a very important fishing place. Fish are caught all winter and are improving in quality every year.

SESSIONAL PAPER No. 22

The Canadian Northern Railway will have their road in operation to White Whale lake this fall, this will open a market for the fish of White Whale lake summer and winter, and for Lake Ste. Annes in summer, and care will have to be taken that they are not overfished.

None of the whitefish lakes in this district could stand the fishing they get for three months in winter if it were continued all through the year.

Little Devil's lake will have to be cleared of the pike in it before it will again be a whitefish lake. These fish simply swarm in this lake and are increasing every year, I think it would be well to consider the wisdom of protecting pike in waters frequented by whitefish. Net fishing for pike for market is not carried on by any one. I am afraid that if something is not done to weed them out, they will at last exterminate the whitefish. As it is they certainly destroy large numbers of young whitefish every year. Pigeon lake suffers to a great extent from their ravages.

On return from Ste. Annes I visited lakes Pakan, Saddle, Floating Stone, Whitefish and Lac la Biche.

The fish in Whitefish lake are increasing owing to less fishing being done, many of the Indians having moved onto the reserve at Saddle lake. Only about a quarter of this lake is in the Indian reserve. So it is quite easy for the department to establish a close season in this lake, all the best bass are outside of the reserve line. I found out at Floating Stone lake that last season, 1904, a half-breed had in a very few nights in spawning season killed 900 fish. This shows this lake is not altogether fished out. The close season was rigidly enforced last fall, and I hope before long to report this lake as again well stocked with fish. The fish in this lake are of unusually large size, and generally very fat. The country about the lake is being settled up quickly, so the preservation of fish in it is of importance.

At Lac la Biche I found that cold weather had prevented any great catch of fish being made in close season. The lake freezing and breaking up constantly made it impossible to set nets.

During the winter some fishermen from Lake Winnipeg made a thorough trial of winter fishing in this lake but could not locate the fish, where they go to is a mystery. The lake swarms with fish in summer time.

A lake 'Finchwood lake,' northeast of Lac la Biche some 30 miles, was found to afford good winter fishing, and doubtless many others will also be found to do likewise. A railroad passing close to Lac la Biche, and a charter has been granted for one, will open up a great fishing country. The fish in all lakes in this section are very large and fine.

Opposite Pakan, 12 miles south, is Whitford lake which is drained by the Egg creek. For some years past there have been very few fish in this lake, now as a result of keeping the creek clear of traps, and protection during close season, the lake is well stocked with pike, which furnish a welcome change of diet to the settlers near it.

Beaver, Hasting, and other small lakes and creeks in the Beaver hills are all full of coarse fish and are well looked after by Guardian McKenzie.

Cooking Lake, 20 miles S.E. of Edmonton, and Gull lake 8 miles west of Lacombe, are both summer resorts for Edmonton people and others; cottages have been built, gasoline launches put on, and lots at both lakes command good prices. There is a constant demand from the frequenters of these lakes, who represent the chief citizens of Edmonton. Strathcona and Lacombe, to get some sporting fish like black bass put in these lakes, and I might state in this connection that from all over Alberta, north and south of the Red Deer river, I am constantly receiving letters asking to have lakes and rivers stocked with fish. These demands can only be met I think by the establishment of a hatchery in Alberta. Edmonton as the distributing point of three lines of railway, and the number of lakes in close proximity suitable for stocking, would seem to me as offering the most suitable site. By Edmonton I mean anywhere in the Edmonton district where suitable water could be had.

The regulations have been fairly well observed throughout the district. The damming of creeks, the making fish traps, and the use of small meshed nets and spears are the most common offences, The guardians have confiscated quite a number of the

6-7 EDWARD VII., A. 1907

two latter, and destroyed a large number of small dams and traps. It is almost impossible to secure convictions, as the offenders are chiefly foreigners who plead ignorance of our laws and language. I think the evil is abating but it would greatly assist me if fishery notices, printed in German, Russian and Galician, as well as in English, were issued by the department. If I might make a suggestion, it would be to have a small card printed with the close season stated and same information as contained on present fishery notices, and have these in the different languages I have mentioned, and ask the Dominion land agents throughout the district to give every homesteader a copy, then there could be no pleading of ignorance of the law. This plan I feel certain would greatly assist in the protection of our fisheries, and would also be appreciated by the majority of the settlers, who are, I think, willing to obey the regulations once they know them.

It is difficult for me, who have lived nearly all my life in the district under my charge, and who yearly take trips covering a large part of it, to refrain from enlarging on the great change that is taking place in the country and the rapidity with which it is being settled. This much I can say, that wherever I have been, I have found the settlers contented and pleased with their location, and as a rule enthusiastic over the soil and climate.

I mention this matter of settlement in order that you may realize the necessity for stricter and more protection, in order to maintain the fisheries of the district at their present standard. The greatest drain will be on the whitefish lakes; high prices for fish for export will cause them to be fished to their utmost. Give the fish a chance to spawn, and limit the fishing privileges in the lakes, and I think there is no reason to fear that the waters in the district will not hold their own.

I have the honour to remain, sir,

Your obedient servant,

HARRISON S. YOUNG,

Inspector of Fisheries.

APPENDIX No. 4.

SASKATCHEWAN.

REPORT ON THE FISHERIES OF SASKATCHEWAN BY INSPECTOR
E. W. MILLER, FOR THE YEAR 1905.

QU'APPELLE, SASK., April 1, 1906.

To the Dominion Commissioner of Fisheries,
Ottawa.

SIR,—I have the honour to submit the following report on the fisheries of Saskatchewan district No. 1, together with statistical return showing yield of fish, value, &c.

The past year has presented no exceptional features and normal conditions prevailed throughout the district. While no large increase has taken place in fishing by net and the number of regular fishermen remains fairly constant; many of the smaller lakes and creeks in the southern portion of Saskatchewan, which were formerly rarely visited by any one, are now much resorted to by angling parties and in the aggregate a great catch of fish is so made. Settlers from foreign lands are specially active in availing themselves of any opportunities to so pleasantly and cheaply vary their diet, and throughout the summer and the earlier part of the winter a good fishing station is generally occupied.

Owing to the enforcement of the close season and the non-issue of netting licenses for small lakes and creeks which might otherwise be soon cleared out, the supply of fish remains practically constant and with the continuance of preventive measures against destructive methods of fishing, there is no reason to fear any depletion of our waters. In some instances parties feel aggrieved that they are unable to obtain net licenses for small lakes and creeks, but in this matter the interests of the public at large have to be considered before profit to individuals.

In the large lakes of the Saskatchewan River country where fishing for export is carried on, the results were mostly very satisfactory. In the Prince Albert district, however, while there was no lack of fish, the same difficulty that has occurred in previous years, prevented a satisfactory output. Under the domestic license system, it appears impossible in this district to secure such a regular prosecution of the industry by the local fishermen as will ensure the successful handling of an export trade. For a profitable business it is necessary that the parties providing outfits, arranging for the teaming of the fish from the lakes, &c., shall be able to rely upon a steady pursuit of the fishery by the men at the lakes during the season. On account of the difficulties of transport, the fishing is confined to the winter season, and the men taking it up do so but temporarily, with the result that the catch is very fluctuating and so uncertain as to deter buyers entering the market. Further north a full supply of fish is reported in all the lakes. Efforts are being made to form a local company to fish these waters which can certainly yield immensely more than sufficient for the local needs, which at present is all that is asked from them.

At Cumberland, the sturgeon fishery was again successfully prosecuted, the catch being made principally with the gill-nets of the local fishermen. The fish were bought by the Northwest Fish Company who also operated three pound-nets but without any large measure of success. The winter fishery was purely for home consumption, to supplement the supplies derived by the Indian and half-breed residents from hunting.

SESSIONAL PAPER No. 22

At Moose lake where the catch of the preceding winter had been phenomenally good, little was done in the summer, but all the netting allowed was worked this winter. The catch was larger in the aggregate though individual fishermen have not succeeded so well. The whitefish which form the great bulk of the catch here were again exported by way of Mafeking on the Canadian Northern Railway, to which point a team haul over the ice of from 100 to 120 miles was necessary. More applications for licenses on this lake were received than could be granted for it, and there was some friction accordingly, one man, a non-resident, being fined by the overseer for persisting in fishing without a license. The men with their supplies who intend to fish here in the winter have to be taken in by boat in the open water season. This fall in consequence of the very early and unexpectedly severe frost in October, much difficulty was experienced in getting on the grounds and many of the men were late in beginning work. While heavier catches are made on the newer and farther locations, there is a set-off in the additional cost of haulage to rail head and, roughly speaking, it may be stated that freight to Mafeking costs nearly half the value of the fish delivered at that point.

Cedar lake has been fished for the market both summer and winter, with very good results. In the summer fish are taken out by High Portage and over Lake Winnepegosis: in winter by the Mafeking route. The summer catch of fish in the Cumberland lakes is also brought out by the Saskatchewan River and Cedar Lake route. Pound-nets were operated here by the Northwest Fish Company with much better results than at Cumberland.

In all these northern lakes, where an export fishery is conducted the rights and interests of the resident population have been carefully watched, and the amount of fishing allowed in any one lake regulated to its capacity as far as possible. A railway to reach the Saskatchewan river at The Pas is now under construction, and its completion will give a considerable impetus to the fishing industry in the numerous lakes north of that point, all of which are reported as well stocked with splendid fish.

In the Nelson river district, the results of the work in the preceding year had proved that fish could not be transported that distance in the winter season remuneratively. Fishing in the winter of 1904-5 was, therefore, wholly confined to the food supply of the residents. Active operations were carried on by the Nelson River Packing Company through the summer with satisfactory results, in Playgreen Lake and the lower expansions of the Nelson river. Pound-nets were experimented with such poor success that their use was abandoned. The catches in gill-nets proved, however, that there was no diminution in the supply of fish, both sturgeon and whitefish being plentiful.

It is to be regretted that a suspension of the winter industry was found necessary as it afforded a profitable occupation to many of the Indians of that district.

In the Qu'Appelle lakes, the comparative scarcity of tullibee, owing to the great mortality among them reported last year, still continued. The supply of pike, pickerel and mullet remains extremely abundant and many fine fish of the first species were captured exceeding twenty pounds weight. Whitefish appear to be increasing slowly though the catch of them remains very small in comparison to that of early years. The amount of angling done in these lakes is very large and probably more fish are taken by hook and line than in nets. These lakes have more than lost the water gained last year and are now extremely low owing to the sweeping out of the river channel by the flood of 1904. The repair of the Katopwe dam is very necessary to prevent a recurrence of the bad conditions existing here before its construction. At Crooked and Round lakes lower down the Qu'Appelle valley, conditions are very similar, the increased number of anglers being very marked, and a few more net licenses were also issued.

At Long lake, where the whole surrounding district has been now well taken up, there was a large increase in the number of net licenses. In nearly all cases, however, these were taken out by settlers for the purpose of supplying their own needs and only a very few men fish for the purpose of supplying the general market. In consequence of the rise of water this lake is now in capital condition and appears well able to meet the demand on its fish resources. The whitefish here are of remarkably fine size, aver-

6-7 EDWARD VII., A. 1907

aging fully five pounds. A dam has been built on the Qu'Appelle river near the outlet from the lake, which will, it is expected, keep the lake at nearly its present level. Before the high water of 1904, its waters had fallen very low and the effect was beginning to be apparent in the falling off of the fishery, the absence of the younger and smaller fish being very noticeable in all catches.

In the trout districts of Southern Alberta the alteration of the close season has given general satisfaction. The rapid increase of population has necessarily led to a larger amount of fishing being done and in particular districts it is to be feared that some of the streams are being overfished, but it is difficult to see how a limitation can be placed on angling other than by shortening the season. There were rumours as to the use of dynamite, but no case could be authenticated.

In the Battleford district an increased amount of fishing was done at Turtle, Jackfish and Cold lakes, and the rush of settlers to this district will assuredly lead to the fishing here being carried on in a more systematic manner than hitherto. There is a splendid supply of fish in these lakes and a much larger catch will cause no detriment.

On the whole it is evident that the observance of the close seasons has been successful in preventing any undue depletion of our waters so far, and while fishing is confined to the authorized methods and times, there is reason to believe that the yield in these waters would be much larger than hitherto.

I am, sir,

Your obedient servant,

E. W. MILLER,

Inspector of Fisheries.

APPENDIX No. 5.

MANITOBA.

REPORT ON THE FISHERIES OF MANITOBA FOR THE YEAR 1905, BY
INSPECTOR WM. S. YOUNG.

SELKIRK, MAN., March 15, 1906.

To the Dominion Commissioner of Fisheries,
Ottawa.

SIR,—I have the honour to submit herewith my annual report on the yield of the fisheries for the province of Manitoba and the unorganized territory called Keewatin for the year 1905, including statistics showing the number of men employed, the number of boats, nets, &c., their value and the varieties and quantities of fish caught.

The subdivisions of my district are the same as made in my last report and are as follows: Lake Winnipeg and its tributaries comprising the principal waterways, as the Nelson river, Playgreen lake at the north, Winnipeg river and its expansions flowing from the east, and Lake St. Martin rather to the northeast of Lake Manitoba, Lakes Rock, Pelican, Swan and Louise and a district formed of small lakes to the south and west of the province, the principal ones of which are Oak lake, Clearwater lake, near Riding Mountains; Whitewater and Lake Killarney, near Deloraine; Fish lake on the boundary line between Manitoba and Dakota.

The value of the yield of fish in my district for 1905 is \$1,503,615, which is an increase over the year of 1904, of \$37,625, although there is a large falling off in the catch of whitefish, 1,395,000 pounds, below the year 1904, a less vigorous prosecution of the fisheries during the year is one cause for the falling off in the catch, and in the second place, one of the large companies' license was cancelled, which put 20,000 yards of gill-net out of business for a part of the commercial season; and then in the third place, very few whitefish were caught during the winter season owing to the unfavourable weather.

While there was a considerable decrease in the catch of whitefish taken from the waters of Lake Winnipeg, there was also a decrease in the output from both Lakes Winnipegosis and Manitoba; the latter being closed in the summer season accounts for the decrease in the catch in that lake.

While there is a decrease in the catch of whitefish, pickerel, catfish and mixed and coarse fish, increases are noted in the catch of pike, perch, tullibee, sturgeon and fish used for home consumption.

Lake Winnipeg and its tributaries.

An examination of the statistics herewith inclosed will show a decrease in the quantity of whitefish caught of 1,000,000 pounds, and also a decrease in the catch of catfish of 50,000 pounds, increases are noted in the catch of pickerel of 250,000 pounds, pike of 25,000 pounds, and sturgeon (caviare) of 1,000 pounds, about an average catch of sturgeon, perch, tullibee, goldeyes, mixed and coarse fish, or fish used for home consumption noted. The total catch of fish for the year 1905 for Lake Winnipeg and its tributaries was 21,575,000 pounds and 36,000 pounds caviare, or the equivalent value of, \$1,112,625, which is an increase in value of \$63,625, over the preceding year.

SESSIONAL PAPER No. 22

Lakes Winnipegosis, Waterhen and Dauphin,

In this district a decrease in the catch of whitefish of 200,000 pounds, pickerel, 400,000 pounds, pike, 200,000 pounds, tullibee, 4,000 pounds, goldeyes, 2,000 pounds, is noted, mixed and coarse fish remain the same; the total yield for this district is 4,822,000 pounds, or a total value of \$225,770.

Lakes—Manitoba Shoal and St. Martin.

On the 13th day of March, 1905, an order in council was passed closing all the waters in this district to summer fishing, which dates from the first day of April to the thirtieth day of November in each year, both days inclusive. The action of the department in the closing of these waters was a popular one and I am sure will be a lasting benefit to the waters of this district. A number opposed the closing of the waters to summer fishing, but now, after the matter is settled, everybody seems to be well satisfied with the action of the department.

During the winter season of 1905 and 1906, those engaged in fishing through the ice report a profitable season. The largest yield in the history of the fisheries for this district is reported during the past winter season, which would go to show that the closing of the lake to summer fishing had a beneficial effect. The catch of whitefish shows a decrease of 200,000 pounds, pickerel of 200,000 pounds, pike or jackfish of 300,000 pounds, mixed and coarse fish of 500,000 pounds. Increases are noted in the catch of perch of 4,000 pounds, tullibee of 10,000 pounds, goldeyes of 2,000 pounds. The total catch in these waters is 3,682,000 pounds, or a total value of \$162,870.

The fish caught in the two latter districts, comprising the Pembina river and small lakes in the south of the province, are all used in the locality in which they are caught, so do not form any part of our export trade.

Summing up and for the purpose of comparison, we give the following :—

Year.	Lbs.	Value.
1904	32,954,000	\$1,465,990
1905	30,130,000	1,503,615
	Decrease..... 2,824,000	Increase..... \$ 37,625

While the decrease in the catch was very considerable, there was a decided improvement in the prices which helped to account for the larger amount realized for the season's operations.

SYNOPSIS OF FISHERY OFFICERS' REPORTS.

Overseer A. J. McPherson makes the following report on the fisheries of Lakes Manitoba, Winnipegosis, Dauphin and adjacent waters, for the year ending December 31, 1905.

The fishing on Lake Manitoba last season has been successful, notwithstanding its being closed for summer fishing. The catch has been well up to the average and the fish in good condition. Lake Winnipegosis fishing has been falling off somewhat, and the fish were very small in the north end of the lake. Over one-half of the whitefish caught during the latter part of the season only graded No. 2 and weighed less than two pounds per fish; this is accounted for by the fishermen constantly reducing the size of the mesh of their nets. In the south end of Waterhen lake, the fish were up to size and catches were very good. Close season has been fairly well observed by the fishermen, only ten men were fined for fishing out of season, but I have had considerable trouble with foreigners putting dams and fish traps on the small streams in the spring during the spawning season for pike and pickerel. Some of these contrivances are very ingeniously made and will catch fish while on their way up stream, and by reversing them will catch more when coming down stream after spawning.

Guardian James Matheson, of Moose Horn bay, reports on the northern end of Lake Manitoba, Fairford river, and Lake St. Martin, in which there was an increase in the catch of all kinds of fish throughout the year, the prices received were on the whole

6-7 EDWARD VII., A. 1907

very satisfactory, the year 1905 was by far the most prosperous year in the history of the fisheries for this district.

Guardian Skuli Sigfusson, of Maryhill P.O., Lake Manitoba, reports on the south end of Lake Manitoba and Shoal lake, the fishing in this district during the winter season was very satisfactory, large catches were made and good prices were received, thus making it a most successful season. The close seasons were well observed.

Guardian Wm. Hughes, Selkirk, Man., reports on the southern end of Lake Winnipeg and the Red river, at certain places he finds a decrease in the catch of fish, especially pickerel, at others about an average catch, the cause of the decrease was on account of the ice taking earlier than usual, and some fishermen lost most of their nets, and did not get started fishing again till late but all through the catch was about an average one, the catfish at mouth of rivers last summer were scarcer the water being very low and the fish did not come in as usual, the catch of pike and goldeyes was good, no abuses came to my notice, and the close seasons were observed throughout the year.

Guardian Joseph Polson, Winnipeg, reporting on the waters of the Red river in the vicinity of the city of Winnipeg, says that during the year 1905, twenty seine net licenses were issued also two domestic licenses for the waters of his district. The season was very favourable and the fishermen reaped a good harvest, and the catch was more than double that of the previous year. There was very little trouble among the fishermen this year; each man keeping his own ground, except one, and his case was speedily settled. He is not aware of any illegal fishing being carried on, as the men are now fully notified that they are being watched during the close season.

Guardian J. Magnusson, Nes, Man., reports that whitefish are getting scarcer every year and that the catch of pickerel last fall was less than in 1904, but that may be attributed to stormy and unsettled weather rather than to scarcity of fish, the close seasons have been fairly well observed, no fines have been imposed or confiscations made of fish or fishing apparatus in this district which comprises the Gimli district and Big Island on Lake Winnipeg, during the year.

Guardian T. B. Perry, Deloraine, Man., reports: I have made several official trips to the fish-producing lakes in my district during 1905 and have nothing of special interest to report regarding same. The fishing in my district is almost entirely carried on in Long lake and Lake Mitigastin; the greater part of the latter lake lies in the United States. The fishing is entirely carried on by settlers living near the lake, and the fish caught are pike and pickerel.

Guardian James Gray, Cartwright, Man., reports on the waters of Rock, Pelican, Swan and Louise lakes. He says: You are aware that no licenses were issued for the waters in this district. There appears to be an abundance of fish in above lakes, in fact trolling was a much used pastime as the fish were very plentiful during the year. I had occasion to remove many traps, principally across the rivers; these traps were solidly built with wire netting attached and at end of dam were traps. A canoe is badly needed in this work, as when driving you are away from rivers or lakes and obstructions are not seen. The Canadian Pacific Railway Company have constructed a fish ladder at Homefield, across the Long river which was badly needed.

As no complaints came from Oak lake, I had no cause to visit that vicinity during 1905. It is my intention to go from Rock lake down the Pembina river to the boundary line as I am informed there are dams made with poplar poles driven down through the ice in winter so as to be in position when the ice goes out.

In conclusion, I would just say that another report which I am preparing will contain some recommendations along the line of a more stringent code of regulations for the waters of Lake Winnipeg.

I have the honour to be, sir,
Your obedient servant,

W S YOUNG,
Inspector of Fisheries.

APPENDIX No. 6.

ONTARIO.

GENERAL REMARKS—FISHING SEASON OF 1905.*

The season has on the whole been a fairly profitable one for the fishermen, though the lakes were this year again visited by frequent and violent wind storms, which caused many suspensions of operations. Notwithstanding this, however, and that apparently fewer fish were caught than in 1904, prices were better, and from the fishermen's standpoint the outcome was nearly as good.

The total number of persons engaged in the industry in 1905, as reported by the overseers, was 3,247, as follows :

Lake of the Woods and Rainy River district, 140 ; Lake Superior, 184 ; Lake Huron and north channel, 359 ; Georgian bay, 315 ; Lake Huron (proper), 326 ; Lake St. Clair and Detroit river, 216 ; Thames river, 76 ; Lake Erie, 803 ; Lake Ontario, 516 ; Nipissing district, 44 ; inland waters, 276 ; 122 less than were employed in 1904.

The amount of capital invested was \$1,129,467, divided over the lakes as follows :

Lake of the Woods and Rainy River district, \$47,175 ; Lake Superior, \$86,775 ; Lake Huron and north channel, \$153,460 ; Georgian bay, \$295,628 ; Lake Huron (proper), \$103,762 ; Lake St. Clair and Detroit river, \$30,419 ; Thames river, \$955 ; Lake Erie, \$326,279 ; Lake Ontario, \$64,294 ; Nipissing district, \$24,000 ; inland waters, \$1,673.

There were in use 122 tugs valued at \$323,675, and 1,464 sail and other boats valued at \$299,498.

There were licensed 530 pound-nets ; 506 hoop-nets ; 27 fyke-nets ; 121 seines ; 130 dip-nets ; 3 machines ; 139 spears ; 13,000 hooks, and 3,910,528 yards of gill-nets, of a total value of \$1,130,800.

The total product of the fisheries amounted to \$22,572,300 pounds, the estimated value of which is \$1,708,963.

The principal species taken, and the quantity and value (including salted) were :

Whitefish, 2,895,820 pounds, \$289,542 ; trout, 6,170,850 pounds, \$617,085 ; herring, 5,232,200 pounds, \$261,610 ; pickerel (doré), 3,236,940 pounds, \$323,694 ; pike (including blue pickerel), 1,479,900 pounds, \$59,196 ; sturgeon, 401,350 pounds, \$32,108 ; caviare, 17,100 pounds, \$11,970 ; bladders, 290 pounds, \$232 ; eels, 20,150 pounds, \$1,209 ; perch, 800,200 pounds, \$24,006 ; catfish, 370,450 pounds, \$29,636 ; coarse fish, 1,939,600 pounds, \$58,188 ; tullibee, 7,450 pounds, \$447.

The total catch shows a decrease of 1,437,670 pounds, and a decrease in value of \$84,561, as compared with that of 1904.

The waters showing a decrease are : Lake Huron, north channel, 1,749,692 lbs.—there being a falling off in the quantity of every kind of fish taken ; the Georgian bay, 474,433 lbs. ; Lake and River St. Clair and Thames river, 102,260 lbs. ; Lake Ontario, 171,159 lbs. ; and Nipissing district, 26,000 lbs. Those showing an increase are : The Lake of the Woods, 262,098 lbs. ; Lake Superior, 149,348 lbs. ; Lake Huron (proper), 65,050 lbs. ; and Lake Erie, 595,795 lbs., the catch of herring and yellow pickerel in Lake Erie showing an increase of 370,800 and 628,270 pounds respectively.

* NOTE.—These statements are taken from the Provincial reports.

SESSIONAL PAPER No. 22

The total yield in the Lake of the Woods and Rainy river district was 1,017,420 pounds valued at \$91,707 ; Lake Superior, 2,647,820 pounds, valued at \$254,178 ; Lake Huron, N.C., 2,689,720 pounds, valued at \$259,668 ; Georgian bay, 2,509,030 pounds, valued at \$239,503 ; Lake Huron (proper) 2,045,430 pounds, valued at \$173,211 ; Lake St. Clair and Detroit river 740,190 pounds, valued at \$33,313 ; Thames River, 182,590 pounds, valued at \$8,256 ; Lake Erie, 7,318,230 pounds, valued at \$437,352 ; Lake Ontario, 2,796 360 pounds, valued at \$163,584 ; Nipissing district, 368,800 pounds valued at \$34,740 ; inland waters, 256,710 pounds, valued at \$13,451.

FERTILIZING LAKE TROUT EGGS.

In a former report the enormous loss of spawn of the lake trout by the taking of those fish at the spawning period was referred to, and it was recommended that steps be taken to prevent a portion at any rate of the serious waste. It was pointed out that the State of Wisconsin had enacted that the fishermen should during the spawning period take the eggs from the female trout while alive, and the milt from the male trout while alive, and after mixing them together in a pail or can immediately cast them into the water from whence such fish were taken ; and it was suggested that our fishermen might in their own interests readily adopt this means of assisting in maintaining the fish supply. The practice has been followed for some years in Wisconsin, and with, it is reported, very satisfactory results. Indeed, it was believed that the planting of eggs in this manner was of more benefit than the close season, and that as large a percentage of them would hatch as in the hatcheries. This is the opinion of one at least of the best fish culturists in the United States. The expense of placing a few experienced men upon the tugs of fishermen operating in Lake Superior, where the trout spawn nearly if not quite a month before the season closes, would not be great, and there is no reason why a plan which has yielded such gratifying results in Wisconsin should not be equally successful here. The fisherman would no doubt be glad to afford every facility for carrying on the work. It is also the plan adopted by some of the States for securing ova for their hatcheries,—that is by sending men to accompany the tugs, and it has proved to be a much less costly and troublesome means than that of operating nets on their own behalf for the purpose.

THE WORK OF CAPTURING AND DESTROYING COARSE FISH IN THE NEPIGON.

The work of capturing and destroying coarse fish in the River Nepigon was again prosecuted ; 7,632 pike, 2,282 suckers, 228 pickerel (or doré), and 145 whitefish were destroyed and otherwise disposed of. The work was all done within a period of six weeks, which gives an idea of the extent to which these fish have multiplied in the Nepigon, and what a menace they are becoming to the trout of that famous river.

THE CARP.

The popular prejudice against the carp—a prejudice which has arisen because of its injury to other and finer species of fish, their spawn and young, and to the feeding grounds of the wild duck, increases as its destructiveness and depredations become more generally and widely known.

It is in the waters of Lakes Erie and St. Clair that it has multiplied and grown most rapidly, and is to be found in greatest numbers in this province. But it is by no means confined to these lakes, for we find it in considerable numbers in the cold, deep waters of the Georgian bay, the north channel and Lake Huron, Lake Superior seeming not yet to have been invaded.

As an example of the prolificness of the carp, it may be said that one weighing 4 or 5 lbs. will contain on an average from 400,000 to 500,000 ova ; one of 9 lbs. 600,000 ; and from one of 16½ lbs. the amazing number of 2,059,750 eggs have been taken. A genius for mathematics has figured it out thus : If from the eggs of a carp weighing 4 or 5 lbs. two fish survive, from one million carp (half of them being females) the increase the first year would be one million fish ; for the first five years (on the compound

interest system) 64 million; for ten years 2,048,000,000; for fifteen years 18,384,000,000.

The carp is a marvel of longevity. The New International Encyclopædia (1902) states that it 'may reach an age of 200 years;' and as for its vitality, Norris, in 'The American Angler's Book,' new edition, (a work of 700 pages) in the chapter 'General Remarks on Fish' makes the almost incredible statement (page 48) that 'it is an established fact that in draining carp ponds in Germany to cultivate the soil which had been flooded and made a fish pond of for the purpose of enriching it, the spawn of the carp left after drawing off the water does not lose its vitality though exposed for two or three years to the heat of summer and frost of winter; and that when the field is again converted into a pond there is no necessity of restocking it with carp, but the ova remaining beneath the surface of the ground produces a stock of carp, thus keeping up an alternation of crops—fish and vegetables.'

The editor of 'Forest and Stream' in a recent article said: 'In the great lakes it is in the very nature of the case a matter of international concern, and it is a concern which every year is becoming more serious, as the fish multiplies in its old haunts and finds its way into new waters.'

The carp is here, and it is here to stay. To extirpate it from connecting water courses is something which may safely be counted as beyond the ingenuity of man.'

In Illinois there is a small lake into which the carp had found its way. The lake had once been famous for its game fish, and the work of ridding it of these 'scavengers' was begun, but after more than 40,000 pounds had been taken the effort was abandoned as hopeless.

While therefore it would appear to be impossible to exterminate the carp from waters in which it has already become established, it is not too late to protect therefrom the more or less isolated waters which have not yet become invaded by it. Our law prohibits the taking of fish in any manner from provincial waters for the purpose of stocking, artificial breeding, or for scientific purposes, without the authority of the department in writing; so that unless carp are illegally deposited therein, these waters are safeguarded to that extent. And in this connection let a word of warning be sounded, and that is in regard to the erection of fishways, which are constantly being recommended and asked for in dams throughout the province. In many cases these dams are now so many fortresses guarding our inland lakes from the enemy. While, if fishways were erected, facility would be afforded for the enemy to enter, and it would be but a short time before it would drive out and supplant all other fish. Much better would it be to discourage the fishways and stock the waters by the introduction of bass, trout or other game or desirable and suitable fish.

It is uncertain when the carp was first introduced into American waters. From an authentic source we find that in the years 1831 and 1832 an enterprising New Yorker brought 'from France' some six or seven dozen which he put into his ponds, and from these ponds he made frequent plantings into the Hudson river, where they are said to have 'thrived wonderfully.' The introduction by the United States Fish Commission was begun in 1877. The first lot brought over consisted of 345 fish, of which 227 were mirror, and 118 scale carp. These were planted in ponds, and in 1879 their progeny, amounting to some 12,265, were distributed to over 300 persons in 25 states and territories. From 22 applicants for carp in 1877, these had increased to 2,000 in 1880. In 1882 over 7,000 applications were received by the commission, of which 5,758 were granted, 143,696 fish being distributed, some of which 'were sent to Canada.' In 1883, 260,000 were distributed in 1,478 counties, and to nearly 10,000 applicants. The distribution was carried on until 1897, when it was discontinued. So that from these plantings the public waters of this continent during the short period of about 25 years are now literally overrun with this fish. In 1883 the fishermen of Lake Erie began to take them in their nets. They did not know what they were, and they were kept on exhibition in tubs as curiosities.

When the question of the introduction of carp into the United States was being considered by the Fish Commission, Prof. Baird, the then commissioner, in his report for 1873-4 enumerated the good qualities of the carp which made it 'a desirable species for cultural purposes,' as follows: .

SESSIONAL PAPER No. 22

1. Fecundity and adaptability to the process of artificial propagation.
2. Living largely on a vegetable diet.
3. Hardy in all stages of growth.
4. Adaptability to conditions unfavourable to any equally palatable American fish, and to varied climates.
5. Rapid growth.
6. Harmlessness in its relation to other fishes.
7. Ability to populate waters to their greatest extent.
8. Good edible qualities.

It has certainly been demonstrated beyond peradventure that it is 'hardy' and 'rapid' of growth, and has 'ability to populate waters to their greatest extent;' but it is doubtful if any considerable number of persons could be found to testify as to its being 'harmless in its relation to other fishes,' and as to its 'good edible qualities.'

It would be a waste of time to discuss the un wisdom of the introduction of the carp, but that a great mistake was made there surely can be no difference of opinion. But 'it is here to stay,' and we must make the best of it. It has been shown that efforts for its extermination have been abortive. Some have suggested that the Government should offer a bounty to induce more people to fish for it. But the best bounty that can be offered is the increasing demand for it in the market. The demand that will make fishing for carp a profitable business will provide the necessary incentive for its capture, and there seems to be an increasing demand in all large American cities where there is a mixed population, and where the better kinds of fish, even for the wealthy, are becoming a luxury. In such cities it will fill a large and increasing want; but it will be some time before the people of Canada, who have been accustomed to our native fish, will cultivate a taste for the alien. The department should afford every facility for carrying on the work of capture that it is proper to afford, and authorize for that purpose the use of every implement, the operation of which will not be a detriment to or assist in the destruction of better species. When treating of the subject some years ago, we held the view that nothing short of concerted action on the part of the several jurisdictions surrounding the great lakes would have an appreciable effect towards permanently reducing its numbers. But this was before it had become to the same extent a mercantile product. The prices are increasing, and in the wholesale market of New York four or five cents a pound has been the average paid during the year, which would indicate a good profit to the fishermen. At certain periods of the year, however, prices are still higher, and by a small outlay provision may be made to retain the take until such time as can be more profitably disposed of. A simple and effective inclosure could be provided to accommodate almost any number of fish by selecting some sheltered spot or bay and running from the shore a picket fence (that which is manufactured and rolled in coils with wire if closely woven would suit the purpose) in a square or semi-circular form, the shore forming one side, the pickets being driven firmly into the ground, and supported at regular intervals by stakes or posts driven more deeply. A woven wire netting may where necessary be added to the top of the inclosure to prevent the fish from jumping out, and with a view to reducing the cost. It is not necessary to suggest that care must be taken to select a place for the pen where the bottom is free from stones and snags so that the fish when required to be marketed may be seined out; and it would afford greater immunity from damage to the inclosure from seas or floating debris if a boom were strung around the inclosure ten or twenty feet therefrom.

The net with which the carp may be taken most successfully is the seine. The gill-net, however, has its advocates, and may always be used to advantage where the carp has entered some place where the net may be set across its one means of escape, or where it may be driven into the net. And it can also be used in many places where it would be quite impossible, from the nature of the ground, to use a seine. A fisherman of experience with gill-nets offers the suggestion that No. 35 thread is of the proper strength, that a six inch mesh is the most profitable size to fish with, and that in making up the net it should be hung five in three—an expression which practical fishermen will understand. If taut, the fish will not enter the net, but will turn from it, it being very wary, 'wise, knowing and cunning.'

APPENDIX No. 7.

PROVINCE OF QUEBEC.

REPORT ON THE GULF OF ST. LAWRENCE DISTRICT BY INSPECTOR
WM. WAKEHAM, M.D., GASPÉ BASIN.

INLAND DISTRICTS, INSPECTORS A. H. BELLIVEAU, OTTAWA, AND
JOSEPH RIENDEAU, MONTREAL.

GASPÉ, January 20, 1906.

The Dominion Commissioner of Fisheries.

SIR,—I beg to submit the usual annual report and statistics of the Gulf Division Fisheries for the season 1905. The returns show a small increase in value over those for 1904—the actual increase is, however, much greater than that shown by our statistics, as the prices of nearly all kinds of fish ruled much higher than the values at which we have calculated them. Cod, which we value at \$4.50 per cwt., actually brought from \$5 to \$6. The same proportionate increase occurred in the case of herring, so that though the season was really a poor one, as far as the actual catch was concerned, yet to the fishermen, owing to the greatly advanced prices which they obtained, it really was one of the best they have had of recent years.

Spring herring struck in as usual about the end of April, and immense catches were made on the recognized spawning grounds, up to the middle of May. At the Magdalen Islands large numbers of vessels came from the Maritime Provinces, Newfoundland and the United States for their supply of bait, while many thousands of barrels were shipped to ports in the state of Maine where the herring are used in the smoke-houses. In the Bay des Chaleurs the greater part of spring herring taken is used to manure the land. This practice is objected to by many, more especially by those who are interested in the cod fishery, which is the staple industry of Gaspé and Bonaventure counties. Herring has certainly become more scarce and irregular along the shores of these counties, during the time of the summer cod fishery, than it used to be, and this scarcity of bait has caused a serious falling off in the cod fishery. All this is attributed by cod fishermen to the practice of using large quantities of herring and herring spawn for manure, and they say that the practice should be stopped.

For many years past I have inquired regularly into the condition of the spring herring fishery, and I cannot detect any diminution in the volume of the enormous schools which each spring frequent the spawning grounds. This being the case, I cannot bring myself to believe that the scarcity of herring bait in summer is due to any injury done by the spring catch, no matter for what purpose it may be used. All the world over, herring frequent certain well known spawning grounds, but once they leave these grounds after spawning their movements are often erratic and uncertain. The matter is, however, one which might engage the attention of the scientific branch of the service.

The cod fishery began at about the usual date in the spring, the middle of May; the fishery was, however, never good until late in the fall, when cod become very abundant. By this time most of the men had abandoned the fishing, and found work in the lumber camps, so that only a comparatively small number of boats engaged in the fall fishing.

SESSIONAL PAPER No. 22

Shippers became anxious, competition was keen, and the price of dried and even of green cod rose enormously, so that those who held on to the fishing did remarkably well. I know of several instances where men averaged \$10 a day for several weeks without any special exertion. This was particularly the case along the coast from Cape de Rosier towards Cape Chatte—herring had been fairly constant along this part of the coast all season, so that a supply of fresh bait being obtainable the fishery was better than elsewhere. This growing uncertainty of the fish bait supply in summer is compelling the fishermen to turn their attention to the storage of a supply in freezers.

The returns for the salmon fishery show an increase of over 300,000 lb., as compared with 1904. This occurred altogether on the north coast, was one of the best ever made. On some parts of the north coast almost phenomenal catches were made in the sea coast nets. On the south coast the fishing was poor both for netters and anglers—the fish were unusually late in running into the rivers, the bulk of the run took place after the fishing season was closed.

The returns furnished by the lobster packers show a considerable increase in the pack, this occurred mostly at the Magdalen Islands, where the summer catch was much ahead of that of 1904, very little was done there during the month's fishing allowed in the fall. On the mainland the pack continues to decrease. The pack for Bonaventure shows a slight increase, but it is a long way below the average of ten or fifteen years ago.

I would most strongly advise that the appliances for hatching lobsters at present in the Gaspé hatchery, be removed to some part of the outer coast, say Percé, Grand River or Port Daniel where a supply of eggs could be obtained, and placed in a lobster hatchery which should be run during the fishing season. This might help to keep up the lobster supply in the neighbourhood. Failing some help of this kind I think the time has surely come when lobster packing in Gaspé and Bonaventure should be stopped for a term of years.

The returns for the mackerel fishery show a considerable gain, 5,072 brls. having been taken as compared with 2,334 brls. for the previous season; this fishery is only prosecuted at the Magdalen Island as it is only at or about these islands that any regular fishing for mackerel is made in the Gulf division, elsewhere an odd mackerel may now and then be taken in the herring nets, but they are not found in sufficient numbers to warrant carrying on of a distinct fishery.

Dogfish were not as abundant as for the three previous years. On some part of the coast where we had been greatly bothered by them in past seasons, they did not appear at all. On the whole we did not hear much about them, though this may be largely due to the fact that the fishermen are getting accustomed to them, and have ceased to complain, having come to the conclusion that 'that which can not be cured must be endured.' I am, however, of the opinion that they are backing off again.

A whaling station was put in operation at Seven Islands, and though the whaling steamer was late in getting to work, and owing to the destruction by fire of one of the drivers, operations had to be suspended before the close of the season, yet some 66 whales had been captured and reduced at the works. This, under the circumstances, was not a bad showing.

Owing to the action of the Newfoundland government in restricting the supply of fresh bait to U. S. fishermen we had an unusual number of them on our Labrador coast, where they are by treaty allowed to fish. They came here because nowhere else could they find a supply of fresh bait, this bait in the shape of capelin they seine for themselves, they are all trawlers. Some conflict occurred owing to our local regulation prohibiting trawling within the three mile limit. The regulation of course applies to our fishermen as well as to outsiders. It was instituted some years ago when U.S. fishermen were never seen on the Labrador.

I found that all of the U. S. fishermen who were on the Labrador had been furnished with copies of the treaty by which they are allowed to fish in the inshore waters of our Labrador, and that they had been instructed to be guided by the terms of the treaty. They were disposed to claim the right of fishing as they please, as our prohibition of

6-7 EDWARD VII., A. 1907

trawling was not mentioned in the treaty. On explaining the matter fully to all those I met, that trawling was not in vogue when the treaty was passed, that it applied to our own fishermen, and was passed as concerning them only, and not with the view of restricting the rights of U. S. fishermen, as they were not in the habit of fishing in our Labrador waters at the time, &c., I found no difficulty in persuading them to set their trawls outside the 3-mile limit, and all those who had set trawls inside removed them outside when asked to do so.

The masters of nearly all these vessels made no secret of the fact that they were driven to fish off Labrador, which they had abandoned many years ago for the Grand Banks, by the passing of the recent Act in Newfoundland, which made it difficult or even impossible to get the fresh bait which they required for the Bank fishery. This shows us pretty clearly to what an extent a regular and steady supply of fresh bait is necessary for the prosecution of the cod fishery.

With some minor exceptions the fishery regulations were well observed, and though, as I have said before, the actual catch of fish was small, with the exception of the salmon, yet prices were so high that the returns to the fishermen was as great as in a good year.

I have the honour to be, sir,

Your obedient servant,

W. WAKEHAM,

Officer in charge of the Gulf Division, P. Q.

REPORT ON THE FISHERIES OF THE INLAND DISTRICTS OF QUEBEC
FOR THE YEAR 1905, BY INSPECTOR A. H. BELLIVEAU.

OTTAWA, March 1, 1906.

To the Dominion Commissioner of Fisheries.

SIR,—To better establish comparisons in the yields of the different kinds of fish with previous years, the former subdivisions have been, as much as possible, adhered to, even when under different officers.

Since the provincial authorities have ceased to exact from their respective officers the statement of the catch of fish in the inland districts, especially where little or no commercial fishing is carried on, it is almost impossible to secure any reliable data of fishery statistics. The fear of an increased license fee still prevents a great many fishermen from returning an accurate yield of fish.

South Shore districts.—In that part extending from Cape Chatte to Lévis on the south shore of the lower St. Lawrence, the fishery statistics have been collected by a Bounty officer in Rimouski and by two provincial officers in the six upper counties. The work seems to have been done carefully and the general yield of fish is much larger than the previous one, showing an increased value of over 100 per cent.

In the county of Rimouski this betterment is attributed principally to the large yield of cod, halibut and sardines. The 400,000 pounds of green cod are alone worth as much as the whole yield of the other fisheries in 1904. Sardines were plentiful and large captures were effected at Matane, Métis and St. Luce. The increase of the catch in this county alone amounts to nearly 300 per cent.

The same abundance prevailed in the two next counties, Temiscouata and Kamouraska, where four times the quantity of fish of the previous year has been returned. At Isle Verte alone, the value of the fisheries exceed the whole piscine product of these counties in 1904. This is due specially to the abundance of sardines and herring in this part of the St. Lawrence. Even salmon were plentiful, about 5,000 pounds being captured at Cacouna alone.

SESSIONAL PAPER No. 22

Eel Grass.—Although the fishermen of l'Isle Verte district realized over ten thousand dollars from the prosecution of their fisheries, during the summer months, their attention is diverted to another branch of marine industry which becomes quite a source of wealth to the fortunate riparian owners where eel grass grows. This long slim grass is cut at low tide and brought ashore in large boats and spread on the fields to dry. It is then shipped in bales to different cities and used for upholstering purposes. Over \$30,000 was realized last year from this marine product by the citizens of the locality. This particular growth is confined to a limited area between the island and the mainland. Its value is not included in our statistical statement, but it was thought worth mentioning.

In the upper districts of Berthier, Beaumont, Lévis and vicinity, the total value of the fisheries is about equal to the previous one. With the exception of eels which were not so abundant, the other species yielded as much and more than during the previous season. More salmon were captured.

This whole south shore district shows a fishery production valued at nearly \$117,000, while in 1904 it was only compiled at \$54,000.

North Shore district.—In that part of my division extending from Quebec to the Saguenay and including Lake St. John, there is but little change to mention. The total value of the catch slightly exceeds the previous one, but this is ascribed mostly to the larger estimate of salmon captured in the small bays and tributaries of the Saguenay, chiefly by poachers.

Besides the anglers' catch, perhaps over a hundred settlers provided with small nets come and claim their quota of salmon from the Saguenay for their own use and sometime even for sale. This number is not exaggerated as two years ago, the active guardian Mr. Maher, of Tadousac, seized over one hundred nets, showing the larger number of poachers. Last year only twenty-seven such nets were seized by the same fearless officer. Even settlers quite a distance from this remarkable stream come and borrow the net of an accommodating poacher and secure a supply of salted fish. It is claimed that one noted poacher alone disposed of hundreds of salmon to summer hotels, &c. It is seldom that the worst culprits are brought to justice as they are always masked and pursue their nefarious work in groups, rendering detection and identification almost impossible. However, a few prosecutions last summer proved effective. The mere seizure of a net is not sufficient punishment for such bold characters.

Lake St. John, which is the head water of the Saguenay, forms a part of the above mentioned division. The extensive net fishing attempted there in 1904 did not prove a profitable venture, and I am pleased to state that the provincial authorities have decided not only to curtail nets in this inland sea but to prohibit their use entirely. It will be a difficult task to prevent all the settlers, especially in the vicinity of the *décharges*, from using a net occasionally. It is claimed that very few ouananiche are ever caught in gill-nets. However, very few fish of any kind were shipped from the railway stations last year, but no doubt a small provision is made by the settlers residing in the vicinity of the ouananiche grounds. There is no doubt that this famous game fish is steadily diminishing, notwithstanding the efforts of the pisciculturists to restock its home, the tributaries of Lake St. John. As some nets were still allowed in 1905, the other kinds of fish such as pickerel, whitefish and coarse fish were still captured in fair quantities, to supply the local demand in Roberval and neighbouring small villages. The only netting tolerated in future in that lake will be by the few Indian families on the Blue Point Reserve not far from Roberval, for their own use.

In the other part of this district, the counties of Charlevoix and Montmorency, eels are the only fish remaining of any importance. Now, many of the numerous weirs around Ile d'Orleans are only set in the fall months for the eel catch, which, for last season, is estimated at 270,000 lb. A few stray salmon are now and then captured in these weirs, about 5,000 lb. in both counties.

Inland districts from Quebec to Pontiac.—The yield of these inland divisions prepared by Inspector Riendeau of Montreal and myself, is steadily falling off. The better grades of fish are giving place to inferior ones. The fish are smaller than formerly. Lake St. Pierre, the most important fishing ground of the district, is being depleted by exces-

6-7 EDWARD VII., A. 1907

size hoop-net fishing, which should be either curtailed or better still, the lake should be set apart for a term of years as are Lakes St. Louis and St. Francis. Fishermen taking licenses for three or four nets have 15, 20 and 25 nets, and at times, they are nearly all in the water. This gross abuse should be remedied effectively by marking, in some way, every licensed implement to better enable the fishery officers to detect the illegal ones. The only rest the lake gets is during July and August, when netting of all kinds is prohibited. This federal regulation is fairly well observed, as very few fish are brought to Montreal markets from there during that hot period. There seems to be a great need of some sturgeon regulation to check the present abuse of immature fish exposed for sale publicly. In fact a minimum size should be prescribed for all species of fish that it is advisable to protect. When sturgeon of nine inches and the young of other species requiring twenty to the pound are sold openly, it is high time for the proper authorities to institute a protective measure.

The total value of the catch of these inland divisions is reckoned at nearly \$10,000 less than the previous one, which itself showed a large falling off. In many cases, the diminished catch does not prove a greater scarcity of fish, but a restricted mode of fishing. For instance, in the upper Ottawa or Lake Temiscamingue, the extensive netting which had been allowed in 1903 and 1904 was entirely prohibited for the benefit of the resident settlers of this now famous mining district. No netting is allowed in Lakes St. Francis and St. Louis, limiting the catch to night lines and angling. It is the intention of the provincial authorities to further limit seining and netting where they will not prohibit their use entirely. It will thus further decrease the general production of fish, but it will be to the benefit of the line fishermen. It will be better thus, as many localities that yield insufficiently for a commercial purpose, would afford amusement and recreation to a great many, who would be satisfied with a limited supply.

Missisquoi Bay and Richelieu River.—This bay and River Richelieu, the outlet of Lake Champlain, seem to withstand the annual drain of considerable fishing better than any other waters under my supervision. The refusal of New York State to receive fish from this locality, hampered the fishermen for a while, but other markets were soon found, and now it is questionable, even if the restrictions were removed, whether all the fish would again find Fulton market. The seiners of Missisquoi bay had a short season but did as well as usual; a good supply of pickerel and perch was secured.

The most extensive eel weirs of Canada, at Iberville, were again successfully operated and yielded fair profits to their owners who shipped mostly to Chicago instead of New York, on account of the petty prohibition of the neighbouring state.

A noticeable incident was the unusual abundance of black bass in the river, especially between the Lacolle and St. John bridges. It was not a rare occurrence for a couple of anglers to capture their two or three dozens in an afternoon's sport.

Eastern Townships.—The beautiful lakes of the townships are not sufficiently protected. Where there is no revenue derived the protection may somewhat suffer. Owing to the sad drowning accident in Lake Aylmer, in the beginning of the summer, when three lives were lost, which cast a gloom in the neighbourhood, there was less fishing indulged in than usual. There is still some poaching carried on, especially in Lake Memphremagog, which is over thirty miles long; the south end extending into the State of Vermont, allows the poachers a greater chance to dispose of their illegal gain. The best protected lake in that district is Massawippi, where a well-organized club takes interest in its protection.

Respectfully submitted,

A. H. BELLIVEAU,

Inspector of Fisheries.

SESSIONAL PAPER No. 22

APPENDIX No. 8.

PRINCE EDWARD ISLAND.

REPORT ON THE FISHERIES OF PRINCE EDWARD ISLAND FOR THE
YEAR 1905, BY INSPECTOR J. A. MATHESON.

CHARLOTTETOWN, January 2, 1906.

To the Dominion Commissioner of Fisheries,
Ottawa.

SIR,—I have the honour so submit my annual report on the Fisheries of the province of Prince Edward Island, together with tabulated statistics, showing the catch in detail in each county and locality.

I regret to report a decrease in the value of the total catch of \$79,624 as shown below :

Total value for 1904.....	\$1,078,546
Total value for 1905	998,921
Decrease	\$ 79,624

LOBSTERS.

The catch of lobsters shows a shortage of about eleven per cent of last season, but fishermen received remunerative prices and made up for the shortage of catch. Considering the large number of factories in operation and traps used in this fishing the average for the last five years has been fairly maintained, as follows :

Year.	No. of Cans.
1901	2,223,712
1902	2,386,070
1903	2,039,603
1904	2,335,400
1905	2,182,624

OYSTERS.

This branch of our fisheries continued to be one of the most important industries and is prosecuted with a good deal of energy in our bays and rivers. The total catch is very little short of last year. The prices obtained by our fishermen were good, and as soon as the federal and provincial governments arrive at a settlement as to which shall lease the areas for cultivating purposes, I have every reason to believe that the oyster industry will be one of our largest and most profitable ones.

SESSIONAL PAPER No. 22

The following shows the quantity in barrels for last 10 years :

1896	30,214
1897	20,915
1898	26,484
1899	18,236
1900	17,825
1901	24,972
1902	20,334
1903	18,333
1904	18,006
1905	17,356

COD.

The season's catch has been a little in excess of last year, but this branch of our fisheries is not followed by any great numbers of our fishermen, as the uncertainty of good catches is so great that fishermen will not devote their time to it. Dogfish still visit our coast and are very destructive to fishing gear and tend much to shorten the catch. The cod drier erected in Souris has been a boon to the fishermen, especially late in the season, when the weather is unfavourable for outside drying.

HAKE.

You will notice a considerable increase in the catch of this fish, which was sold by fishermen at good paying prices.

MACKEREL.

The catch of mackerel this season was small, but the quality was good, and quantity was only a little short of last year, late in the season large shoals of small mackerel were taken off Rustico, which were disposed of at good prices.

HERRING.

I have to report a considerable shortage in the catch of herring, which are principally used for the purposes of bait.

The fall fish, which were of good quality, were much short of last season's catch.

The smokehouse in Georgetown was not operated this season.

SMELTS.

The catch of smelts this season is the largest for the past five seasons, a great many fishermen engage in this business and make it profitable during the winter months.

TROUT.

More trout have been taken than in former years. The catch is yearly increasing, although not shipped, is used for local consumption, and sportsmen are much interested. With the aid of the hatchery established at South Port last season to replenish our streams and rivers, a considerable increase of this fish in the near future is anticipated.

QUAHAUGS.

Large quantities, some thousands of barrels were taken and shipped, realizing good prices in the American market. I would advise some restrictions being put on this fishing, as under present regulations it is difficult to prevent fishermen from interfering with oyster beds when fishing them ; the season might be made uniform with the oyster season.

6-7 EDWARD VII., A. 1907

Overseer Davison, Prince County, reports there is a decrease in almost all branches of the fishing except herring. It is the opinion of many of our fishermen that the decrease in oysters is largely owing to the destruction of the small oysters by the starfish, which has become very plentiful in our waters. He says:

I am of opinion that the decrease in mackerel and codfish is principally caused by the dogfish who destroy the gear and rob the bait from the hooks. The only reason I can give for the decrease in lobsters is that they are overfished. I would strongly recommend that some regulations be made regarding gill-net fishing for smelts, as they are becoming very generally in use.

The fishing of quahaugs is getting to be quite an industry, and their value is double that of previous years. They are mostly shipped to the United States. About 70 per cent of the lobsters are shipped to England, 25 per cent to the United States, 5 per cent to Canada. Cod are mostly all shipped to Halifax. Excepting about 10 per cent for home consumption, 90 per cent of the catch of smelts goes to the United States, 10 per cent to Canada. Mackerel all go to the United States.

Overseer McCormack, King's County, reports the lobster season opened later than usual on account of the scarcity of bait. First lobsters packed May 1st, with good fishing during May. About the 10th of June a shoal of small cod struck inshore and drove the lobster into deep water for about two weeks, from that till the close of the season they had about the usual fishing. On the whole there was a fair pack in this county, although near 2,000 cases short of 1904, which was a banner year.

Cod struck in about the 25th May and good catches of large fish were taken, for about two weeks, when they slackened off and were very scarce during the rest of the season, until November, when there was good fishing until the end of December, which brought the yield up to 1,000 quintals above last year.

Hake fishing was about the same as last season, but no doubt would have been much better had it not been for the dogfish which destroyed the trawls as fast as they were put out.

I am, sir,

Your obedient servant,

J. A. MATHESON,
Inspector of Fisheries

APPENDIX No 9.

NEW BRUNSWICK.

District No. 1, comprising the counties of Charlotte and St. John. *Inspector J. H. Pratt, St. Andrews.*

District No. 2, comprising the counties of Albert, Westmorland, Kent, Northumberland, Gloucester and Restigouche. *Inspector R. A. Chapman, Moncton,*

District No. 3, comprising the counties of King's, Queen's, Sunbury, York, Carleton and Victoria. *Inspector H. E. Harrison, Fredericton.*

DISTRICT No. 1.

REPORT ON THE FISHERIES OF DISTRICT NO. 1, NEW BRUNSWICK,
FOR THE YEAR 1905.

ST. JOHN, N.B., January 30, 1906.

To the Dominion Commissioner of Fisheries,
Ottawa.

SIR,—I have the honour to submit herewith my annual report on the fisheries of District No. 1, New Brunswick, for the closing year of 1905, together with the statistics of the several sub-districts and a synopsis of the reports of their officers.

A very gratifying increase of \$67,011, in the value of the catch for the year can be noticed over that of 1904, due almost entirely to an increased herring catch in the county of Charlotte. Only an average catch of herring was made in St. John county, where the price ruled low, owing to an extra good catch in Charlotte county. The prices for cod and pollock kept high during the season, in fact prices for all kinds of fish showed an upward tendency, and now at the end of the year the price for all line fish is higher than it has been for many years.

The statements for the past year's catch collected very carefully place the value at the high figure of \$1,582,402, which is \$297,000 in excess of 1901, which was a very prosperous season in this district.

The value of the material that the fishermen used in the pursuit of their calling, by a careful estimate is estimated at \$865,371, being an increase of \$29,710 over that of 1904, showing that more strenuous efforts are being put forward by our fishermen in order to win a better reward as the results of their labours in the waters of the Bay of Fundy.

With a view of a clearer appreciation of this year's increase in the value of our fisheries, I will quote the value of the catches for the past five years :

1901	\$ 1,285,073
1902	1,064,126
1903.....	1,067,826
1904 ..	1,515,391
1905.....	1,582,402

6-7 EDWARD VII., A. 1907

Considerable fishing by the use of dynamite charges being exploded among the schools of pollock that frequented Quoddy river and among the islands, was carried on during the summer season, more especially during our absence cruising on the Nova Scotia coast, but as the fishermen who used this deadly explosive were residents of the state of Maine, detection and capture were very difficult. However, by anchoring off Eastport for a week and assisting the United States officers, several offenders were arrested and heavy fines were imposed by the Eastport magistrate. When it is well known that fully two-thirds of all fish killed by dynamite sink to the bottom and are lost, a faint idea may be formed of the immense destruction caused by the use of this explosive. Although all fishermen are against the use of dynamite on the fishing grounds it is surprising how reticent they all are in giving information to a fishery officer with a view to prevent this most destructive practice.

The replacing of the row and sail boats by those propelled by gasoline engines, is one of the changes now in progress among our fishermen. Almost every one of them desires to possess a motor boat, and as the numerous agents in their anxiety to procure new customers for their firms make the terms of payment quite easy, all obstacles are thereby removed and the fisherman is relieved from the laborious parts of his hazardous occupation. Therefore he is in better physical condition to attend vigorously to his fishing operations when he arrives on the grounds, and thus it will be the means to a large extent of increasing his catch.

DOGFISH.

The dogfish pest is still occupying public attention all along the coasts of the maritime provinces owing to the immense destruction of fishing gear by them, and the consequent loss of time from fishing while those voracious schools of fish frequent our coasts. The establishment of reduction works will no doubt have considerable effect in lessening the numbers of this pest, but as yet none of those factories have been established in the Bay of Fundy. It is admitted that when the dogfish are on the coast, the schools of herring being preyed on by them results in their being driven off shore, thus causing the scarcity so often complained of by fishermen.

Should the proposed canning of dogfish as an article for human consumption become a success, their canning will form quite an important industry in this district, and as they are reported by epicures as being a palatable fish, there is no doubt a market will be discovered for them.

HERRING.

A satisfactory increase will be noticed in the value of pickled herring, while an increase of \$32,552 is the result of the catch of herring suitable for canning purposes. Those fishermen who are in the habit of netting herring on the 'Ripplings' off Grand Manan were pleasantly surprised at finding better fishing than has been found there for the past twenty years, thus proving that the theories of the utter ruin of the 'Ripplings' as a permanent fishing grounds for herring were without any foundation.

The sardine canning factories on the Canadian side, owing to an abundance of suitable herring, packed 694,200 cans more than in 1904, having a value of over \$32,000. As the capture of the herring schools forms the principal occupation of the fishermen in my district, it is a matter of great pleasure to be in a position to report to your department that the season's operations have been so satisfactory to all concerned.

Owing to this large increase in the catch of sardine herring, the numerous sardine canners in the state of Maine increased their output very materially over preceding seasons, and as there has been a considerable amount of carelessness exercised by the canners in their methods this season, it is predicted that there will be a considerable drop in the prices of those sardines not sold during the present winter and next spring, an over-supply of cheap sardine herring invariably results in their being carelessly packed at the factories, and as a natural consequence, a decrease in the price of the goods.

SESSIONAL PAPER No. 22

The rapid settlement of Western Canada by European emigration will ultimately lead to the packing of those fish on the Canadian side as this class of emigrants in the Western States are the principal consumers of the state of Maine pack.

SALMON.

The fishermen report a very successful season in this fishery, and the figures show an increase of 36,810 lb., having a value of \$7,362. During the first part of the salmon season the fish were very scarce, and those who were interested in this fishery, became downcast and disheartened, but soon the schools began to work in shore, and night after night the fishermen were delighted at the large number of this valuable fish that were becoming meshed in their nets.

This fishery has every appearance of a satisfactory annual increase, and its great value warrants every means being adopted in order to encourage and make permanent this increase. A couple of rivers require fishways inserted in their dams, and when they are completed I am certain the fishermen will notice an increase in the salmon schools frequenting our shores each season. During the salmon fishing the weather fortunately was fine, which fact increased the catch materially. A number of the boats each stocked from \$600 to \$700 worth, and one boat lacked only a few dollars from stocking \$1,000 for her season's catch of six weeks duration.

LOBSTERS.

Although it is commonly supposed that this valuable fishery is gradually becoming extinct, the satisfactory returns for the past season show the reverse. Of course many contend, and quite truthfully too, that to secure this increased catch more fishermen and more gear were employed in this fishery. However, the next few years will determine this interesting problem, and as the value of lobsters is higher each year, it is to be sincerely hoped that the fishery will show an increase.

2,988 cwt. is the amount of the past season's increase, having a value of \$29,880. On account of the financial returns therefrom, many fishermen are still sorely tempted to fish for lobsters illegally, but I am pleased to say their numbers are continually lessening, on account of the greater vigilance of the fishery officers.

On account of the law in the adjoining state of Maine allowing lobster fishing to be carried on during the whole year, our fishermen are tempted to engage in the illegal lobster fishing. Several of those persons were captured and fined last year, thus giving a check which will no doubt result in much benefit to this fishery.

Lobster fishing was dull during the winter months, the extremely cold weather probably driving them off shore, but in the month of May they began to come inshore again and good catches were the result. Some good returns in this fishery were made by some of the boats, especially between St. John and Point Lepreaux, one man, for instance, alone in a boat, caught \$170 worth during the month of May. April and June also yielded good returns of catches in St. John county.

POLLOCK.

Nearly 23,000 of this fish were taken, principally in the waters of Quoddy river, although the Grand Manan pollock catch was well up to the average. The prices received by the fishermen were higher than they have ever received before.

The pollock made their first appearance for the year off Grand Manan in the latter part of April and the latter part of May they put in an appearance in Quoddy river, and good fishing resulted during the summer months. A number of weirs at the island of Campobello succeeded in capturing hundreds of quintals of pollock, the stock of one weir especially being placed at over 1,000 quintals.

Some attempts to capture pollock by the use of dynamite were made in the vicinity of the islands in Quoddy river, but through fear of detection and arrest very little dynamite was used by the lawless element in Canadian waters.

6-7 EDWARD VII., A. 1907

COD AND HADDOCK.

A slight decrease will be noticed in the catch of cod, but the very high prices prevailing during the whole year amply compensated the fishermen for the decrease of 2,000 quintals in the catch. Haddock were quite scarce all the season, and although extremely good prices were paid the fishermen for their catch, the returns will show a decrease in value of nearly \$15,000, the total value of the catch being \$40,080.

COCKLES.

More of our fishermen are engaging in this remunerative fishery, and all the catch is exported fresh to Boston where it is eagerly sought after by fishermen on the George's Banks. It is reported on good authority that a cockle is the only kind of bait that a dogfish will not eat, while he will ravenously devour all other kinds of bait.

High prices are paid the fishermen for all the cockles they can procure, and \$1,800 was the result of their very short season's work. This fishing is only carried on in the vicinity of St. Andrews, but there is no question, that it will soon extend to other parts of the Canadian coast.

SYNOPSIS OF FISHERY OFFICERS' REPORTS.

Overseer Frazer, of Grand Manan, states that an increase of \$50,000 will be noticed this year over that of 1904. This increase will be found in the herring fishery, large quantities of them being kippered, canned, and smoked. An increase will also be noticed in the lobster fishery, good prices being received for them. A small decrease will be seen in the catch of cod, haddock, and pollock, with the prices of all kinds of fish ruling high. About 90 per cent of our fisheries both fresh and manufactured, go to foreign markets, most of them to the United States. The close seasons were quite well observed, and the patrol boat assisted very materially in carrying out all the regulations.

A number of the prominent fishermen are going into the business of putting up boneless herring, an industry that can be profitably carried on here on account of the abundance of material being right at hand. Herrings fit for the bloater trade have been very scarce and a large grade of medium herrings have been taking their place, and they find a ready sale at remunerative prices.

Overseer Savage, of Campobello, reports that herring of all sizes were more plentiful than last year, but as the demand was limited the prices were forced down to a low figure. Our fishermen neglected the sardine fishing owing to the low prices, and turned their attention to line fishing. The returns will show that the quantities of sardines taken in this district was very small. There was a large increase in the catch of lobsters, owing not only to better fishing, but also to the change in the size limit which allows the fishermen to take nine inch lobsters. As nearly double the number of traps were fished than last year, this may have something to do with the increased catch. Prices were high for shipping in the shell, and also in the canneries.

All kinds of fish were plentiful and prices were higher than ever before received, with the exception of sardine herring. Owing to the large catches of pollock being made in a number of weirs, the total catch of that fish exceeds that of 1904, with the prices exceedingly high.

Overseer Billings, of the St. Andrews division, reports a large increase in the catch of sardine herring but less money received on account of the low prices prevailing throughout the year. During several months, while the fish were very plentiful, the owners of the weirs received but \$1.50 per hogshead. The few weirs that had contracts with the Eastport factory owners, received the contract price of \$4 per hogshead.

SESSIONAL PAPER No. 22

There was an increase in the take of clams but the prices remained the same as last season. Owing to the regulations regarding clams being strictly enforced the beds are remaining in very good condition, and no doubt will yield a permanent supply.

Some attempts were made at illegal lobster fishing but several of the offenders having being promptly arrested and fined, the others ceased operations suddenly.

I am, sir,

Your obedient servant,

JOHN H. PRATT,

Inspector of Fisheries.

DISTRICT No. 2.

COMPRISING THE COUNTIES OF ALBERT, WESTMORLAND, KENT,
NORTHUMBERLAND, GLOUCESTER AND RESTIGOUCHE.

MONCTON, March 3, 1906.

The Dominion Commissioner of Fisheries,
Ottawa.

SIR,—I have the honour to submit my report of the fisheries in District No 2 of the province of New Brunswick, consisting of the counties of Restigouche, Gloucester, Northumberland, Kent, Westmorland and Albert, together with the parish of Stanley in the County of York, and the parish of Aberdeen in the county of Carleton, for the year 1905, with tabulated statements, giving the products and values by districts and counties, together with an estimate of the capital employed in the prosecution of these fisheries.

These returns show an increase in the aggregate values over those of previous years.

I will now briefly refer to the principal kinds of fish caught.

SALMON.

The catch was very much larger than in 1904, and not only our rivers and streams, but the waters of our coasts were teeming with them after the fishing season closed, which ensures good fishing in future.

SHAD.

Less taken than ever, these fish are getting scarcer and dearer every season. Years ago they were sold at from three to four cents each, now they bring from 20 to 25 cents; then a boat in a few hours would net four or five hundred fish, as many as are now caught in a month. Nothing will restore this valuable fishery but a close time during the spawning season, say until the 20th June.

HERRING.

The spring run on every part of our coast was simply immense, and increased quantities were taken for every purpose for which they are used, the catch later on the Caraquet and Miscou banks, was hardly up to average, these latter are good fish and with more care in curing would bring good prices.

MACKEREL.

About the same as in 1904.

SESSIONAL PAPER No. 22

COD.

I have to report a falling off in this fishery from previous years of about fourteen thousand cwts. of dry fish, caused principally by the want of bait early in the season, and the dogfish nuisance later. Prices were very high, which helped the fishermen out somewhat. Provision should be made to ensure a supply of bait at all times.

SMELTS.

Though the catch for the months of January and February, 1905, was rather below the average, the weather was very cold and the fish were got to market in perfect condition, bringing extra prices, which made up fully for the slightly smaller quantities, but owing to the weather being so mild and changeable during the past winter, they reached market in poor condition, prices ran down, consequently considerable quantities are still held by shippers, and it is indeed fortunate that no extension was granted in February.

LOBSTERS.

In the aggregate, about three thousand cases (140,000 cans) more were packed than in previous year; the gain was principally on the coast between Chockpish and Miscou; at Caraquet and some other places on the Baie des Chaleurs the catch was small, entailing some loss to the canners.

OYSTERS.

I find the quantity raked was not quite up to that of previous season, but prices were very high. Owing to good employment elsewhere, not quite so much attention is given to this fishery at Bay du Vin and other points on the Miramichi river, as formerly, and at Buctouche, Cocagne, &c., hard shell clams (Quahaugs) are of much more importance than oysters.

CLAMS.

Immense quantities, especially of quahaugs, have been raked again this year, while reserving the oyster areas in the several harbours during spawning time is doing much good, by enabling the clams on such areas to spawn, which spawn is carried by the currents and winds to all parts of such bays and harbours. Some regulations governing this fishery should be made giving space between teeth of rakes used, so as to prevent the taking of very small ones; licenses also should be issued to give our officers better control.

I have the honour to be, sir,

Your obedient servant.

R. A. CHAPMAN,

Inspector of Fisheries.

DISTRICT No. 3 (Inland).

COMPRISING THE COUNTIES OF KING'S, QUEEN'S, SUNBURY, YORK,
CARLETON AND VICTORIA.

FREDERICTON, N.B., February 20, 1906.

To the Dominion Commissioner of Fisheries,
Ottawa.

SIR,—I have the honour to submit my annual report on the fisheries of District No. 3, in the province of New Brunswick, for the year 1905, showing the quantity and value of fish taken, also the materials and value of same used in connection with the fisheries of this district.

A comparative statement of the value of fish taken and materials used in 1904 and 1905 is herewith given, viz. :—

Value of Fish.

In 1904	\$65,256
“ 1905	65,387

showing a very slight increase for 1905.

Value of Materials

In 1904	\$54,781
“ 1905	55,348

an appreciable increase for last year.

There are some features of the past season's fishing which are very gratifying to all concerned, and I wish to mention particularly the splendid runs of salmon in the St. John river, especially noticeable near the head of tidal-water, and the splendid surface-fly fishing enjoyed by the Tobique Salmon Club. This branch of our fishing was, perhaps, not any better in 1905 than the previous season, in the lower counties, viz. :—King's, Queen's and Sunbury, but there is a notable increase in York county. The reason for this may be that the ice in the river broke up much earlier than usual and gave fishermen a chance to set their nets before the salmon got past on their way to the spawning grounds. I trust the number stopped here, will not, in the future, affect the supply. It did not seem to do so the past season as the sport on the Tobique was excellent, although some say that the fish do not appear to be of such good size as formerly. A very pleasing feature in connection with the past season was the discovery of a very interesting salmon pool about five miles from Fredericton. This was only made known about two weeks before the close season (August 15), but, in those two weeks more real sport was enjoyed by, probably one hundred persons, many of whom have not the time and means to take a trip very far from home, than they ever hoped to have in this line of sport. While no large fish were taken with the fly about forty nice grilse were. We look for great sport here in the future and hope to be in a position to give this part of the river special protection. Other fish, with the exception of trout, were taken in about the same quantities as usual. There is quite a falling off in the quantity of trout. Fishery officers ascribe it to the unprecedented low state of the water in all trout resorts.

SESSIONAL PAPER No. 22

The fishery law has, generally, been very well observed. We still have some trouble in the county of King's regarding the dumping of sawdust into the stream, but I think not as much as formerly. Probably we have more violations, with regard to the taking of fish, in York county than anywhere else. There is greater opportunity to do so than elsewhere in my district. The extra men allowed me for a few weeks last season resulted in much good being done. Much illegal fishing, drifting with net at night, was prevented, some seizures of nets and other materials made, and a few small fines collected.

SALMON.

As previously stated in this report the salmon fishing, generally, was very successful and indicates that the protection we are giving, along with the very efficient protection given by the Tobique Salmon Club to these fish on their way to and after they have reached their spawning grounds, is bearing good fruit. I am satisfied that if we could place a sufficient number of good special guardians on about fifty miles of the St. John river, from the head of tidal-water up, and the present restrictions regarding the issuing of fishery licenses continued, the run of salmon in a few years would be immense. As stated in my report for 1904, I would like to see the license of 3 cents raised to 5 cents per fathom.

SHAD.

A gratifying increase in the quantity of shad taken, salted and used in the fresh state, is reported by the fishery officers. The market for shad seems to be unlimited as when properly salted they are an excellent fish for winter and much sought after. Our shad fishermen receive a good sum for the fish.

HERRING.

The quantities of these fish, taken, does not seem to vary to any extent, from year to year, and are reported only from the districts near the salt water.

ALEWIVES.

The quantity of alewives reported as taken show a slight decrease. I was of the opinion that this would be so, from conversations with fishermen early in the season. Possibly the industry was not prosecuted to as great an extent as in some former years. The market, however, was good and fishermen had no trouble in disposing of their catches.

TROUT.

I have to report a falling off in the quantity of trout taken in the past season. This little game fish is looked upon as the most general sport producer, and if they are shy or scarce it is very generally known and a host of people spend more or less time in their pursuit. The very low condition of water in all the lakes and brooks the past season is supposed to be the cause of the smaller quantity taken. I wish, here, to thank your department for the interest taken in producing a stock of trout fry from the Bartibog Hatchery on the 14th of June and taken to and placed in Magaguadavic and Davidson lakes by Overseer McKay and Dr. E. W. Henry, of this city. These fry were received in very good condition and I trust will be of benefit to these lakes.

PICKEREL.

There was considerably less of this fish taken in 1905 as compared with the previous year. I have been requested to bring to the attention of the Fishery Department the advisability of making it illegal to fish for pickerel with a net of less size than three inches mesh. It is claimed that a great amount of undersized fish are taken at

6-7 EDWARD VII., A. 1907

present. A change as suggested would, no doubt, be to the advantage of fishermen in a short time.

BASS.

Practically none of these fish are taken in this district. A few licenses are granted and a small quantity of bass caught for domestic use.

STURGEON.

I can report with satisfaction a small increase in the quantity of sturgeon taken. While the total amount is not large, as reported, the per centage of increase in both fish and caviare is very good. I trust, with good protection this industry will again grow to large proportions.

SYNOPSIS OF REPORTS FROM FISHERY OFFICERS, 1905.

KING'S COUNTY.

S. G. Coggin, Sussex, reports the law well observed in his district. Trout fishing not as good as usual. It is thought the water was too low. Three very nice salmon, weight from 10 to 13 pounds taken with the fly in the Kennebecasis, near Sussex.

S. G. Myers, Norton Station, reports fishing generally not as good in his district as it was in 1904.

S. G. McCready, Penobsquis, reports trout fishing poor on account of very low conditions of streams.

S. G. Dunham, Grey's Mills, reports fishing in his district much better than usual.

QUEEN'S COUNTY.

Overseer Hetherington, Queen's East, reports the fisheries, generally, in his district as being in a fairly prosperous condition. Shad fishing particularly is prosecuted to a very much greater extent than it was a few years ago, and a greater demand for this fish than he ever knew before. He again suggests that a license fee of \$1 per net be put on shad fishing. Evidently there are some young sturgeon in these waters as Mr. Hetherington says they are a curse to shad nets. He reports the law fairly well observed.

Overseer Bulyea, Queen's West, reports that his special guardians attended well to their duties, the law very well observed, and fishing about as usual.

SUNBURY COUNTY.

Overseer McLean, Sunbury County, reports alewives very plentiful and sales good. The catch of shad was very good, but catch of salmon is light. He thinks the first good run came so early that they got by before fishermen got their nets set. Mr. McLean corroborates Mr. Hetherington's statement that pickerel are becoming small and thinks it would be advisable to amend the law so that the meshes of pickerel nets would not be less than three inches. Mr. McLean recommends that a fishway be built in the Hart Mill dam near Fredericton Junction. No violations reported by special guardians.

YORK COUNTY.

Overseer McKay, of Fredericton, reports that the salmon fishing in the St. John river during the season just closed has been very far above the average for a number of

SESSIONAL PAPER No. 22

years. Many of the fishermen claim there were more salmon grilse in the river last season than any other for the last twenty-five years.

On the Southwest Miramichi, the run of salmon is gradually falling off each year, and the last season was unusually poor. Accordingly, foreign sportsmen are also decreasing. Angling at the head of the river in Carleton county is quite extensively carried on by fishermen from the upper St. John river and the local inhabitants, chiefly for trout. He attributes the scarcity of salmon to overfishing in the tidal waters of the Miramichi, particularly below Chatham, where two shipping fish merchants are located.

The catch of trout is much less than last year both in our local streams and in the lakes as Oromocto, Harvey, Skiff and Magaguadavic lakes, all of which are very close to railway accommodations, and if well supplied with trout, Americans would build cottages and with their families remain at these nearly all summer. A few have already done so and others would follow if good fishing could be relied upon.

Reports say that considerable illegal fishing is being done at Oromocto and Harvey lakes in the early spring. Some few get a trout license and there being no guardian on duty at that time many others are said to take advantage of that fact and go along as if they also had licenses. I would therefore recommend that the guardian be appointed about March 15 or April 1, at the latest, and to remain on duty during your pleasure. Shad and other fish are about the same as last year.

A very pleasing feature of my report is a new departure in the mode of fishing on the St. John river. I refer to surface-fly fishing for salmon. About August 1 last, two local sportsmen were induced by Guide Thos. Phillips to try their luck at a pool about five miles above the city of Fredericton, where they had the good fortune to land two salmon each during the afternoon. The good news spreading rapidly throughout the city brought lots of sportsmen to the scene, with the result that up to the beginning of the close season (August 15), over forty salmon and grilse were taken. One keen sportsman, Mr. Thos. Peters, Deputy-Commissioner of Agriculture for New Brunswick, on last day of the season tried another pool about two miles further up the river and had the pleasure to land a six pound salmon. The whole being a most excellent showing and gives a positive contradiction to the often reported remark that salmon would not rise to a fly in St. John river. These gentlemen, very naturally and justly so, feel proud in being the pioneers in this most excellent sport, and it is to be hoped as the seasons come and go, many other pools will be found until the river will equal, and perhaps excel, any other in the province in giving sportsmen the enjoyment they have so often wished for.

I regret to have to report Wellington Davies' death, at about Nov. 1, 1905. He was guardian of Kedron lake and Magaguadavic river and lake. *Re* filling his position I will report to you in the near future but at present think it might be divided between Guardians Stack and James. Will also ask some change in protection at the St. John river.

CARLETON COUNTY.

Special Guardian Brooks reports some infractions of the Fishing Act, but, although he did what he could to enforce the regulations and prevent a deal of illegal fishing yet some was done, and he was unable to get the names of the parties.

VICTORIA COUNTY.

The officer was unable to get a report from the Tobique Salmon Club, but from others who are acquainted with the state of the fisheries in that river, and from information I got from parties who fish on that river we learn that it was again a splendid

6-7 EDWARD VII., A. 1907

season. The special guardians under Mr. LeClair attend well to their duties, and I would not forget to give the Tobique Club their due credit for the very efficient protection they give the salmon after they reach that river.

Overseer Gagnon reports a decrease in the catch of trout in some parts of his district, and like other fishery officers thinks it is because of the very low condition of the streams. With the exceptions of a few minor infractions, the fishery law was well observed. All his special guardians have done their duties satisfactorily.

I have the honour to be, sir,

Your obedient servant,

H. E. HARRISON,

Inspector of Fisheries.

APPENDIX No. 10.
NOVA SCOTIA.

District No. 1—Comprising the four counties of the Island of Cape Breton.

Inspector A. C. Bertram, North Sydney.

District No. 2—Comprising the counties of Cumberland, Colchester, Pictou, Antigonish, Guysborough, Halifax and Hants.

Inspector, Robert Hockin, Pictou.

District No. 3—Comprising the counties of King's, Annapolis, Digby, Yarmouth, Shelburne, Queen's and Lunenburg.

Inspector A. C. Robertson, Barrington Passage.

DISTRICT No. 1.

NORTH SYDNEY, C.B., April 16, 1906.

To the Dominion Commissioner of Fisheries,
Ottawa.

SIR,—I have the honour to submit my annual report of the fisheries for the year 1905, for District No. 1, comprising the four counties of the Island of Cape Breton. Herewith I inclose, with report, the statistics, giving the products of the fishery for the year in kinds, quantities and values, together with value of plant and material employed.

I am pleased to report that there is a very marked increase for the year in the total value of the fishery, over that of 1904, of \$174,078. This increase is made up in the general yields of all kinds: the leading commercial branches as compared with the previous yield in value as follows:—

	1904.	1905.	Increase.
Mackerel	\$206,268	\$318,174	\$111,906
Lobsters	313,095	369,101	56,005
Herring	86,745	122,849	36,104
Haddock	80,175	97,929	17,754
Salmon	27,226	28,840	1,614

In order to see at a glance the result of the season's operations by counties, I submit the following compiled statement:—

County	1904.	1905.	Increase.	Decrease.
Cape Breton	\$270,254	\$341,314	\$71,060	
Inverness	222,385	313,557	91,172	
Richmond	493,585	526,196	32,611	
Victoria	178,577	157,811	\$20,766
	<hr/>	<hr/>	<hr/>	
	1,164,802	1,338,878	194,843	
			20,766	
			<hr/>	
			Increase	174,077

6-7 EDWARD VII., A. 1907

It will thus be seen that the season's operations have been successful. Of course the increased price of commercial fish has materially helped to swell the total values.

In the whole district the statistics show there were 109 fishing vessels employed against 111 and 634 men employed against 624 men of the previous year. The value of those vessels engaged in 1905 was \$45,480, against a value of \$47,975, in 1904. The boats used last season numbered 2,939, against 2,734 in the previous year, and the number of men employed was 5,237, against 4,866 men in 1904. The value of the boats employed last year was \$64,215, against the value of \$55,084. Thus while boat fishing increased by over 20, the vessels decreased by 2. There were 5,866 men engaged in the deep sea fishing last year against 5,490 in 1904. The total value of material used last year in the fishery was \$572,165, against \$498,268, during the previous season.

With the increase of trap-nets and bait freezers, the fishermen are not likely to be handicapped in future years by scarcity of bait. Last year seven trap-nets were set, an increase of three over the previous year, and 37 freezers and ice-houses last year, an increase of three over the previous year. The trap-nets employed next season will more than double those employed in 1905, with an increase of half a dozen freezers and ice-houses. The fishermen, therefore, are not likely to have so many weeks of enforced idleness as a result of 'no bait.'

Adverting to the employment of trap-nets, I may here state that on the northern coast of Victoria county during the first part of the season the quantities of haddock taken in two traps could only be handled with difficulty, so great was the catch. It is this evidence of immense school of haddock on that coast in the early season that has caused so many of the fishermen to apply for trap-net licenses for the approaching season. The owners of one of the trap-nets, through inexperience, allowed their fish to become damaged and unsaleable and lost money. There is no establishment yet started on the northern coast for the converting of haddock into the cured article, known as 'smoked finnan haddies.' From the immense quantities that can be taken, there is little doubt that an establishment for the curing of those excellent food fish would pay investors handsomely. South Ingonish should be a very suitable place for such an establishment.

As year follows year there is no evidence of decrease in any kind of fish, either in deep-sea or river. Of course seasons bring forth failures in the fisheries, but these failures can be traced to weather conditions, scarcity of bait, or ravages of the dogfish pest. Before the arrival of dogfish during the last days of June, deep-sea fishing is good, but as soon as they make their appearance on the numerous banks which surround this island, food fish, particularly the cod family, disappear, dogfish taking possession of the various banks. In the autumn months, when mackerel take their departure for southern waters, dogfish also disappear. Thus they follow the mackerel schools from southern haunts and depart from our northern waters when mackerel take their departure in autumn.

I have in former reports referred to the dogfish pest. In this report I have nothing further to add. I do not think their numbers have increased during the past three years. Yet, with the exception of those taken by local fishermen for fertilizing purposes, and the few taken by some lobster packers for experimental canning, there has been nothing done in my district to exterminate them. That they are a great menace to the prosecution of deep sea fishing, there is abundance of evidence. That dogfish are the cause of the absence, during the past twelve years, of midsummer herring which previously made their appearance in large schools in our bays and harbours as regularly as the midsummer months came around, is beyond doubt. Those fish were the best of the herring family that visited our coast, and were considered equal in size and flavour to the No. 1 Labrador herring of years ago. Their absence, therefore, has been a distinct loss, not only to the average fisherman, but to the average farmer, who always had his gill-net ready for their appearance, and besides his supply of herring was able to realize many dollars for sale of his surplus.

With our fishermen fishing is pursued in a perfunctory way, as most of them have small farms which they cultivate, thus dividing the two occupations. That there is enough wealth in the sea for more energy and capital, all must admit. The

SESSIONAL PAPER No. 22

quantities of fish taken on the Cape Breton coast by the local fishermen is not more than thirty per cent of its catch. Vessels from the United States, from Western Nova Scotia, P. E. Island, Newfoundland, St. Pierre and Miquelon fish during the summer months around our Cape Breton coast, their enormous catches never entering into the annual fishery statistics of Cape Breton. The fish taken by United States fishermen not only enter into the consumption of that country, but fresh and cured are exported to the Western Canadian markets. This Canadian market should be supplied by our own fishermen, but our own maritime people do not seem to possess the enterprise which their southern neighbours display so abundantly. The natural advantages are theirs, but somehow they do not seem to take advantage of their favourable position. Now that Canadian fish exporters have lost the Cuban market, which to them was so important at one time, one would imagine that they would get back at the United States by taking from them the Canadian market, but so far no effort has apparently been made to reach out for new markets. Possibly an increase in the Canadian duty on foreign fish might give the fishermen of the maritime provinces a portion of the Ontario market.

Cape Breton's inland sea, known as the Bras d'Or lakes, is a great resort for cod and herring, which can be caught all seasons of the year. That the fish find abundance of food in those waters is evident from their fat condition. It is not unusual to catch cod weighing over sixty pounds in the Bras d'Or lakes. Those fish are in abundance and are caught through the ice in winter as well as in open water in the summer months. Herring, too, are abundant in certain parts of the great lakes, and supply the home market as well as large quantities disposed of for bait purposes to vessels and lobster packers. No doubt with proper transportation and refrigerator cars, those fish could be disposed of with profit in the upper province markets. Here again enterprise is conspicuous by its absence.

The Inverness salmon rivers were well supplied during the summer with salmon, and not for years was there such excellent angling in the Margaree river. The visitors from abroad to the Margaree river were delighted with this sport, and no doubt there will be an increased number of them from the United States and the upper provinces next summer. The result of the angling in the salmon and trout rivers last summer shows that water conditions have all to do with those fish entering the upper waters, as the rivers were well watered last summer. During low water in the rivers salmon and trout will not attempt to reach the fresh water pools,

All the other kinds of river fish were plentiful during the season, with the exception of alewives which, for some reason unknown, did not make their appearance in such large schools as in former years.

I have the honour to be, sir,

Your obedient servant,

A. C. BERTRAM,

Inspector of Fisheries.

DISTRICT No. 2.

ANNUAL REPORT OF THE FISHERIES OF DISTRICT No. 2, NOVA SCOTIA COMPRISING THE COUNTIES OF ANTIGONISH, COLCHESTER, CUMBERLAND, GUYSBOROUGH, HALIFAX, HANTS AND PICTOU.

PICTOU, January 31, 1906.

To the Dominion Commissioner of Fisheries,
Ottawa.

SIR,—I have the honour to submit my annual report of the fisheries of District No. 2, Nova Scotia, together with tabulated returns showing the increase or decrease of each kind of fish.

The estimated value of all the fish taken during the past season is \$2,441,155 which is about 32 per cent more than the estimated value of the catch for last year, and about 35 per cent above the average catch for the past 16 years; however, there is about 10 per cent of this increase, attributable to the large quantity of dogfish which were taken and used for fertilizer at the reduction works at Canso and rated as such.

Of the anadromous fishes the report shows an increase of about 7 per cent in the catch of salmon, a decrease of about 50 per cent in the catch of shad, a decrease of about 20 per cent in the catch of smelts, a decrease of about 8 per cent in the catch of alewives of the deep-sea fishes.

Codfish, there is a decrease of about 9 per cent; haddock, there is an increase of about 7 per cent; pollock, an increase of about 200 per cent; halibut, an increase of 400 per cent. Comparing the catch of the whole cod family including cod, haddock, hake and pollock, there is an increase of 23 per cent.

SALMON.

On the Atlantic coast of the counties of Halifax and Guysboro' there was an increase of about 50 per cent in the catch of these fish over that of last year, while on the Straits of Northumberland there was a decrease of about 10 per cent and in the Bay of Fundy counties a decrease of about 16 per cent.

The past season has been a most unfavourable one for the future of this fishery, owing to the condition of the rivers during the time the salmon usually ascend for spawning. So far as I can learn from residents near the rivers, the water has not been so low for forty years in the autumn months, the result being that the fish did not ascend until they were well advanced in the gravid state and comparatively helpless while the shallow water exposed them to the onslaught of poachers, and made their protection by the limited number of guardians a matter of great difficulty.

Some of the guardians did excellent work, however, and through the efforts of Guardians William Livingstone and Johnston Cameron in Pictou county, eight persons were summoned and seven convicted.

SHAD.

Last year I reported that the catch was the smallest since the year 1890. This year I have to report that there is a decrease in this season's results of 50 per cent from that of last year, the catch of the several years being as follows:

SESSIONAL PAPER No. 22

	Barrels of shad taken.
1890.....	756
1891.....	1,178
1892.....	1,811
1893.....	1,346
1894.....	981
1895.....	1,208
1896.....	1,090
1897.....	1,382
1898.....	2,777
1899.....	3,208
1900.....	1,375
1901.....	749
1902.....	948
1903.....	2,115
1904.....	644
1905.....	333

Overseer Davison, of Colchester county, says regarding this fishery : I know for a certainty that the month of May is the spawning season, and the Shubenacadie and Stewiacke rivers are the two rivers in which our shad deposit their spawn.

In former years he has had to report as many as 5,000 barrels exported from his division. Then the fishermen commenced operations about June 10, and the shad caught were very fat ; so fat indeed that in frying them in a pan not only was it unnecessary to add any fat for cooking but there would be a surplus left in the pan. Occasionally a chance one which was not fat was taken and these are supposed to have come from the spawning grounds. He again urges the protection of the fish while in the rivers for spawning.

Overseer Campbell, of Cumberland, says that shad which used to be plentiful are now almost extinct.

Overseer James R. Mosher says that in his report four years ago, he had stated that if the shad were not protected, they would become extinct, and it has about come true for there were only 5 barrels taken last year, as compared with 750 in 1899, and that was only about one third of the quantity which used to be caught each season about 1875. He advocates a close time for five years and protection of the fish in the spawning waters.

ALEWIVES OR GASPÉREAU.

The catch is the smallest during the past seventeen years and is about 9 per cent less than last year. On the Atlantic coast Overseer Rowlings reports them as very scarce and only about 5 per cent of what would be caught a few years ago were taken, nor can he account for this as there are several rivers with lakes for spawning to which they have access without molestation.

HERRING.

The catch was about 28 per cent greater than last year and a little more than the average catch of the past sixteen years.

MACKEREL.

Schools of spring mackerel first made their appearance about May 15, and good catches were taken in Guysboro county. The total catch for the district shows an increase over last year of about 40 per cent and more than an average of the past sixteen years by about 20 per cent.

HALIBUT.

The return shows the largest catch of these fish for sixteen years and is about 75 per cent larger than that of last year.

LOBSTERS.

The quantity canned in the district was about $2\frac{1}{2}$ per cent less than last year, while the quantity exported fresh in shell was about 100 per cent more. Had this excess of fresh lobster been canned, it would have resulted in an increase of 7 per cent over the catch of last year.

It is to be noted that on the Atlantic coast and in the Straits of Northumberland the increase is nearly the same.

FISHWAYS.

During the past season fishways have been built in the two dams on the River Herbert in Hants county and one in Guysboro county on a tributary of the St. Mary's river.

Fishways are recommended to be built in a dam at Aspen on the St. Mary's river by Overseer D. Reid, of Guysboro, and A.R. McAdams, of Antigonish; on a dam on the Lawrencetown river by Overseer George Rowlings, of Halifax; on dams on the Walton, Meander and St. Croix rivers by Overseer Jas. R. Mosher; on two dams on the River John, in Pictou county, by Overseer James Kitchin.

During the year forty-one persons have been convicted of violations of the Fisheries Act, and fines ranging from \$1 to \$100 imposed. A number of these convictions have been on view of the offence by the local officers, the others in the Inspector's Court.

For the first time since lobster canneries were licensed there was a reported violation in Cumberland county by licensed canners packing longer than the law allows; they were convicted on view and fined \$100 each.

I have the honour to be, sir,

Your obedient servant

ROBERT HOCKIN,

Inspector of Fisheries.

SESSIONAL PAPER No. 22

DISTRICT No. 3.

ANNUAL REPORT ON THE FISHERIES OF DISTRICT No. 3, COMPRISING THE COUNTIES OF LUNENBURG, QUEEN'S, SHELBURNE, YARMOUTH, DIGBY, ANNAPOLIS AND KING'S.

BARRINGTON PASSAGE, N.S., May 2, 1906.

To the Dominion Commissioner of Fisheries, Ottawa.

SIR,—I have the honour to submit my annual report upon the fisheries of this part of the province, with the statistical tables showing the catch of fish and its value in the seven counties forming the said district.

The whole yield, as compiled from the returns of the different fishery officers, is valued at about four and a half million dollars, more than the value of the other two districts of Nova Scotia together. This amount exceeds the previous yield by over \$135,000.

The following statement gives the relative importance of the different counties of my division, showing which have prospered or the contrary :

Counties,	1905.	1904.	Increase.	Decrease.
	\$	\$	\$	\$
Digby.....	1,314,057	1,242,407	71,650
Shelburne ..	1,173,501	941,173	232,328
Lunenburg.....	869,833	984,745	114,912
Yarmouth....	712,625	871,179	158,554
Annapolis... ..	182,810	93,274	89,536
King's	123,401	94,414	28,987
Queen's	122,824	136,824	14,000

REMARKS.

Of the four large producing counties, Shelburne makes the best showing with its surplus of nearly a quarter of a million dollars. This is attributed to the large capture of lobsters. Over three million pounds of live lobsters are reported as shipped, mostly to U. S. markets, from this county alone, being an increase of nearly nineteen thousand cwts. over the production of 1904. Line fish, as haddock and hake, also contributed very much to the surplus yield of Shelburne. Of the three smaller counties, Annapolis has almost doubled the catch of 1904. This large increase is also attributed mainly to the deep water species, as cod, haddock and hake, which were abundant in that locality.

Lunenburg, with its large fishing fleet, shows a falling off, ascribed chiefly to the shortage of cod and mackerel, proving that the bank fisheries were not proportionally remunerative to the shore fishing.

In Yarmouth, the decline is more apparent than real, as in former years the port of Yarmouth had the credit of all live lobsters shipped therefrom, while perhaps 40 per cent were captured in the neighbouring waters of Digby and Shelburne. This year this has been corrected. There seems to be also a large falling off in the catch of herring.

6-7 EDWARD VII., A. 1907

LINE FISH.

However, taken as a whole, the line fisheries of my district more than hold their own; in fact, haddock, hake and pollock all show fair improvement.

LOBSTERS.

Fewer lobsters were preserved in cans, but more were shipped fresh, bringing the total value to about the same as that of the previous season. The prices obtained for these live crustaceans are much higher than the rates used in the compilation for the statistics. Digby, Yarmouth and Shelburne being in close proximity to the Boston market, benefit the most by the remunerative prices now realized for live lobsters.

Herring yielded about the same as in 1904, but mackerel declined considerably, hardly more than half the previous value being realized.

CAPITAL INVESTED, ETC.

Nearly fourteen thousand persons found employment in the fishing industry of my district, about fifteen hundred of which work in the sixty-one lobster canneries dispersed over our sea coast.

The fishing crafts of this division are valued at \$1,198,000, the gill nets, seines and other fishing implements represent \$421,000 more. While \$187,900 is invested in our lobster plant, the fish freezers, smoke houses and other fixtures in the fishing industry represent nearly another half million dollars.

I have the honour to be, sir,

Your obedient servant,

A. C. ROBERTSON,

Inspector of Fisheries.

APPENDIX No. II

REPORT ON FISH-BREEDING OPERATIONS IN CANADA

1906

REPORT OF PROFESSOR EDWARD E. PRINCE, COMMISSIONER AND
GENERAL INSPECTOR OF FISHERIES FOR THE
DOMINION OF CANADA.

To the Honourable L. P. BRODEUR,
Minister of Marine and Fisheries,
Ottawa.

OTTAWA, October 15, 1906.

SIR,—I have the honour to submit my twelfth annual report upon the operations carried on in connection with the artificial propagation and transplantation of valuable kinds of fish, native to the waters of the Dominion. In my report last year, I made special reference to the remarkable expansion of the hatchery work under the auspices of the Dominion Government. I pointed out that, in a period covering the last thirty years, the number of hatching establishments had more than quintupled. As a matter of fact, with the new hatcheries whose erection is either completed or in an advanced state, the department has now no less than thirty-two institutions devoted to the important object of incubating the eggs of valuable species of commercial and game fish; and attached to many of them are rearing tanks and retaining ponds, where the young fish are cared for and protected until they are some months old, or, in certain cases, until one to three years old. The Lake Lester ponds, province of Quebec, have been operated successfully as before, while the black bass ponds, on the Bay of Quinte, near Belleville, yielded an ample supply of healthy young bass. One of the important features of the past season was the completion of the first shad hatchery, on the shores of the Bay of Fundy, near Windsor, N.S., while the selection and preparation of a new salmon retaining pond to replace the old-established tidal retaining pond for parent salmon, at Carleton, N.B., has been a matter of great moment in the fish-culture scheme carried out by the department. The retention of salmon, taken in June and July, mainly from the net fishermen, or from departmental fishing stations, and kept in tidal water until October and November when they are matured and ripe for purposes of artificial propagation, has been an unquestionable success. When the late Mr. Wilmot tried it for the first time at Tadousac, in 1875, grave doubts were expressed as to the ultimate success of the experiment, but the fish remained in the salt-water inclosure in perfect condition, and the plan was extended; and the well-known salmon-pond at the mouth of the St. John River, N.B., has been a most valuable and reliable means of supplying a number of hatcheries with an abundance of healthy salmon eggs. The new pond at St. John, will, it is hoped, prove as reliable as the old pond which was an invaluable adjunct to the hatchery system of the maritime provinces.

Last year the total output of fry of all kinds showed a grand total of 627,541,000, exclusive of the yield of young black bass and brook trout, and of lobsters hatched in the sea from the 52,772 'berried' or egg-berring female lobsters liberated from the Gabarus lobster ponds operated as explained in my last year's report by arrangement with Mr. H. E. Baker, a prominent Cape Breton lobster canner. This year the lobster ponds at Fourchu contained in the course of the season the total of 42,066 egg-bearing lobsters, and after the conclusion of the fishing season these lobsters were liberated in the open sea and their eggs were hatched by the parent fish under natural conditions; the young fry thus scattered over the areas off-shore, which are Nature's nursery for these minute crustaceans.

SESSIONAL PAPER No. 22

During the season of 1906 a grand total of no less than 653,052,000 fry of various kinds of fresh water and marine fishes were planted from the Dominion Government hatcheries.

The table which follows shows the various species of fish and the total number of each kind respectively hatched and successfully planted from the different establishments operated by the department, during the year.

Atlantic salmon (<i>Salmo salar</i>).....	11,705,000
B.C. salmon	78,025,000
Speckled trout (<i>Salvelinus fontinalis</i>).....	738,000
Salmon trout (<i>Salvelinus namaycush</i>).....	3,147,000
Grey trout (<i>Cristivomer namaycush</i>).....	437,000
Pickarel or Doré (<i>Stizostedion vitreum</i>)	25,000,000
Lake whitefish (<i>Coregonus clupeiformis</i>).....	63,000,000
Lobster (<i>Homarus americanus</i>).....	471,000,000
Total.....	653,052,000

For facility of reference the detailed table below specifies the name and location of each hatchery, also the quantities of young fish and of eggs in an advanced condition supplied by each establishment respectively, and the species of fry or the kind of eggs so distributed during the season.

Number.	Name of Hatchery.	Number of Fry distributed.	Number of Eggs sent to other Hatcheries.	Species of fish.
1	Ottawa, Ont.....	812,000	100,000	Salmon Trout.
	"	67,000		Gray Trout.
	"	120,000		Atlantic Salmon
	"	124,000		Speckled Trout.

Further details as to the working of each hatchery will be found in Superintendent F. H. Cunningham's report, which follows my present report. Mr. Cunningham has been very fully engaged in visiting sites suggested for new hatcheries, in arranging for the erection of other hatcheries which have been authorized, and in inspecting a considerable number of the hatcheries while in the midst of their operations. With the continued growth of the fish-breeding system in all parts of the Dominion, it has become impossible to inspect and supervise the various institutions as frequently as is desirable, hence it became necessary to appoint a special officer, Mr. Alexander Finlayson, to perform these imperative duties. I have on several occasions adverted to the services of Mr. Finlayson, and the exceptional qualifications which he possesses in the field of artificial fish-culture, and in the work of regular hatchery inspection, the department will be enabled to keep in more direct touch with the various hatching establishments and the officers in charge and the staffs under them.

For many years the only regular inspection was on the occasion of my systematic tours as Dominion Fisheries Commissioner to the different fishing localities in the most diverse parts of the Dominion. I visited in the course of my official tours every hatchery in operation, but as year after year new buildings were erected any regular inspection became very difficult. With Mr. Cunningham as Superintendent and Mr. Finlayson as Inspector, the necessary supervision will be more effectively accomplished. I took the opportunity while visiting all parts of the British Columbia coast and the upper waters of certain salmon rivers during the past summer, to visit every Dominion hatching establishment on the Pacific coast. I have visited the Bon Accord, Fraser River hatchery, and the establishments at Harrison Lake; Pemberton Meadows, Birkhead River; Granite Creek, Shuswap Lake, Nimpkish River, near Alert Bay; the remote hatchery at Lakelse Lake, on the Skeena River; and the fine building at O-Wee-Kay-No Lake, Rivers Inlet, the last-named being visited indeed twice, viz., in December last, and again, in July. It is with very great satisfaction that I am able to report most favourably on all these hatcheries. The department is fortunate in having, at each of the institutions referred to, officers in charge of exceptional ability. I found each one intensely interested in his work, work often very arduous and always very responsible, and enthusiastic in producing the best results without excessive expenditures. The residents in the various localities spoke most highly to me about these officers; and about the staffs of assistant officers, employed in the different branches of hatchery work, under the direction of the officers in charge. Some of the hatcheries are situated in places very isolated and remote, where only officers conscientious and enthusiastic in the extreme could be relied upon to produce the splendid and successful results, which I am able to record in my present report. Further, in some of the isolated hatcheries, especially near the head-waters of great rivers, like the chief salmon rivers of British Columbia, the hatchery buildings must be located on sites which, at times, are in danger of mountain slides, or of gigantic freshets and floods. The dams and retaining inclosures, necessary for supplying water, or relieving the overcrowded tanks in the hatchery, are imperilled each season from January to June. It is an important question whether or not hatcheries should not, in all cases, be built in accessible situations, so that the eggs may be brought down from the upper spawning grounds, and the newly hatched fry shipped by scow or canoe, before the spring floods, up to the nearest tributaries or suitable portions of the main river. The young of the various species of Pacific salmon do not remain many months in the upper waters before they descend to the sea, hence it is not material to transport them from the hatcheries to the highest sources of their native rivers. The most important species of B.C. salmon, as is well known, viz., the sockeye or blueback, is hatched, as a rule, in small streams which empty into more or less spacious lakes, and rarely in the main channel of rivers, though I know of many exceptions, and have seen sockeye salmon breeding in creeks which were almost tidal in character, so near to the sea was the source of the stream chosen by the spawning schools. It is hardly necessary to add that in case of an accident or a breakdown, or in case of illness amongst the staff, the results, in the remotely situated hatcheries to which I am making reference, might be very serious. Cases are on the department's records of such mishaps, which are inevitable at times, and only the skill and foresight

SESSIONAL PAPER No. 22

of the officer in charge has prevented disaster. Two cases have come to my notice in the Dominion hatcheries recently, in which it was only by efforts almost superhuman that the officers in charge averted loss of fry and injuries to the hatcheries under their care, and had the officers in question not remained continuously at work for two or more days and nights in succession, the results would have not only been unfavourable, but possibly disastrous.

These observations upon the location of hatcheries, and the desirability of selecting accessible locations rather than distant and remote sites, brings up the allied question, 'should fry be always planted on, or close to, the natural spawning areas?' If so, it is clear that hatcheries must be located near the grounds in question. To convey fry from even some of the existing hatcheries, placed as near as may be to the breeding grounds, is, as many of our officers in charge are well aware, a most laborious and difficult task. It has been insisted that young fry should not only be carried up to the highest possible shallow areas, but they should be scattered thinly or 'sown' so that they may not crowd or be massed too numerous together. The fact cannot be ignored that, by a law of nature which it is impossible to overcome, unless by exceptional and often difficult measures, a certain proportion of young fishes are destined to be the food of aquatic animals, birds, &c., and the retention of the small fish until they attain some size, will not save them from that toll which nature provides should be paid by one class of living creatures to other living animals. The fish-culturist must face the fact that a proportion of liberated young fish will inevitably succumb to the conditions of fish-life in the rivers and the sea. One of these conditions being, that small fishes are the natural food of other creatures, including the finny tribes themselves. I have so often, in former reports, dwelt upon the advantages secured by the adoption of the methods of artificial fish-breeding, that I need only refer to the gain which is secured by saving the defenceless eggs from that terrible decimation which they suffer when placed by the parents upon the natural hatching ground. I may quote from my special report, of which a revised reprint, much extended, was published in the department's (Fisheries) report last year:—

'It is plain that if we can secure the eggs from the ripe parent fish and hatch them under the care of experts, the results must infinitely surpass those possible under natural conditions, where a small proportion only can be expected to surmount all the dangers and difficulties of their environment. Let me give an illustration of this waste of eggs on the natural spawning beds—a waste not contrary to natural law, but obedient to the principle of compensation and adjustment, universal in the world of nature. In 1895 I spent some time closely observing certain spawning beds of the Fraser river salmon, commonly called sockeye or blueback. I noticed, not once, but scores of times, pairs of fish busy nesting, the male fish lingering near his partner until she shed a shower of eggs. Just as the eggs were cast into the rapid stream, the male fish had his attention attracted by a rival, and darted with lightning speed to drive him off, both male fish tearing at each other with gaping jaws, armed with formidable teeth, the teeth at this time being of abnormal size. Time after time I saw female fish wasting their eggs in this way, for the eggs deposited in the gravel by the female, while her partner was engaged in a fight twenty or thirty yards away, were unfertilized and would, of course, perish or be eaten by hungry enemies, suckers, trout, &c., which hovered near in hordes.

This loss of naturally spawned eggs is universally admitted, but the crowding on the spawning grounds, or 'redds' as they are called in Britain, proves injurious to the fish, as the fungoid growth, which is so terrible a disease, is transferred from one to the other, if indeed this crowding is not the original cause of the disease. The first great destruction takes place on the 'redds.' Everywhere over these are tiny raised heaps of gravel sheltering the spawn, but the shelter is insufficient to guard it from devouring enemies. These are in the air, on the land, in the water. Many members of the hungry salmonidæ themselves prey on the spawn, and it is difficult to cope with them. Bunches of wild duck and teal seek out the 'redds' in the autumn, and feed on right through the night if not disturbed. Here too, as frequently witnessed, the swan leads her cygnets, and it is known that one of these large birds will destroy nearly a gallon of ova in a day.

If, to the natural loss of enormous quantities of eggs by non-fertilization, be added the depredations of ducks, loons, herons and aquatic birds, not to speak of otters and four-footed enemies, as well as destruction by floods, by mud, gravel and ice, it is easy to see how great are the advantages offered by artificial incubation, and by caring for the eggs in properly equipped hatcheries.

It is not sufficient merely to select the head waters, or even the shallow natural resorts of such fish as the young of the salmon, but to plant the product of the hatcheries in waters where the minimum of risk to the young fry can be secured. The sowing or scattering of the fry thinly, over gravelly shallows, will not by any means ensure their safety and there are authorities who favour the planting of large batches of newly-hatched fish in fairly deep water, placing reliance on the instinct of the young in scattering widely, and distributing themselves upon the nearest accessible shallows, in lakes or streams. Young fish certainly do scatter and dissipate in the most amazing manner when planted. They melt away, as it were, before the eyes of the hatchery officers, and close examination a few hours later will reveal to a trained eye the minute, almost invisible, little creatures hiding in interstices between pebbles and boulders, safe from the detection of wandering enemies.

The principal risks to which young fish are exposed, when planted on shallow flats in-shore, as usually recommended, may be summarized as follows:—

(1). Floods and freshets may smother them or sweep them over swampy overflowed fields where they may be stranded and lost. In the deeper main streams this will be less likely to happen.

(2). Frost and floating ice may kill them, as they lie in the gravelly shallows.

(3). Ducks and aquatic animals, especially water beetles, and insect larvæ, which are most destructive to small helpless fish, can detect and prey upon them, when only partially hidden along the sides of lakes or streams.

(4). In dry seasons the fry may be left exposed to drought, or may be cut off altogether from the safety of the main river channel. I have twice during the past summer found schools of valuable fish, of small size, thus cut off and doomed to perish as the water receded. With a small-meshed landing net I cleaned the pools of the imprisoned fish, and carried them to the main channel where they were secure from the fate which otherwise would inevitably have come upon them. In one of these cases the pool, which was almost entirely dried up, contained the young of not fewer than nine species of fish, some of them in considerable numbers, like the small black bass, and doré or pickerel.

The details of the work accomplished in the various hatcheries will be found, as usual, in the several reports of the officers in charge. The report of the Superintendent of Fish-Culture (Mr. F. H. Cunningham), which follows my present report, affords information, summarized, of the hatching ponds, and other fish-propagation methods, in addition to a concise statement of the work of the hatcheries since the report of last season.

I have the honour to be,

Your obedient servant,

EDWARD E. PRINCE,

Commissioner of Fisheries and General Inspector of Fisheries for Canada.

SESSIONAL PAPER No. 22

ANNEX A.

OTTAWA, October 30, 1906.

To Prof. E. E. PRINCE,
Dominion Commissioner of Fisheries,
Ottawa.

SIR,—Owing to the general success which has attended the operations at the various fish-breeding establishments under the direct control of this department throughout the Dominion, it affords me great pleasure to offer this report on fish-culture for the past year.

One of the most valuable assets of the Dominion is its fisheries, which last year amounted to over twenty-nine millions of dollars, such vast resources forming a national food supply must be husbanded and nature assisted as far as possible by a careful extension of fish breeding operations at such points that offer the necessary facilities for extending the same.

HATCHERY SITES.

The selection of a suitable site is the initial and most important factor of the work. Not only must a supply of pure water be available at all times, but the spawning grounds should be within a reasonable distance of the location. Whilst this remark refers generally, it is perhaps more applicable to British Columbia where it is found that the Pacific salmon will not survive in confinement to the same extent as the Atlantic salmon, hence it becomes necessary that the locations for hatcheries on the Pacific coast must be even nearer the spawning grounds than is actually necessary in the east, which means the erection of hatcheries far up the streams and as very often happens in isolated places, hard to reach and expensive to maintain. The question arises, why not locate the hatcheries in more convenient places and transport the eggs and fry to and from such points. This could be done providing navigation would allow; but unfortunately for the system in British Columbia the streams are so rapid that the reaching of even the spawning beds nearest the mouths of the rivers would be a very expensive and hazardous undertaking.

Again, the sockeye salmon, with few exceptions, are not ripe for spawning purposes until they reach the upper waters of the rivers, which, as a rule would mean the transporting of green eggs long distances by water and over rough trails before reaching the hatchery. This would of necessity entail a heavy mortality in the eggs, so that the inconvenience, isolation and extra cost of maintenance is more than balanced by the larger number of fry that can be produced from a given quantity of eggs by having the establishment near the spawning and distributing point.

RETAINING PONDS.

The system followed by the department some years ago in securing parent salmon for eastern hatcheries was by sweeping the upper reaches of the rivers at about the spawning time. This method was discontinued and a retaining pond established by the late Superintendent of Fish Culture, Mr. S. Wilmot, in the harbour of St. John. From this pond, which would accommodate about fifteen hundred salmon from May to November, it was intended to fill as many of the lower province hatcheries as possible. This scheme has proved very successful.

6-7 EDWARD VII., A. 1907

The parent fish are purchased directly from the commercial catch, placed in the pond and after being spawned are released to return to the salt-water. A number of the fish so retained were marked before being released each year and during the past season a number of these fish have been again captured.

Owing to sewerage pollution it became necessary to select a new site for the retaining pond this season, and as an experiment Little River is being used for this purpose. The ultimate success of the selection can only be determined after the spawning operations are completed this fall.

The question of establishing retaining ponds for parent fish at such of the hatcheries as afford the necessary facilities has been laid before the department on several occasions: but the convenience of travelling in all directions, both by rail and water, from St. John, enables the one general pond to, as a rule, supply the requirements of the eastern hatcheries.

REARING PONDS.

This is a phase of fish culture that might well be extended to such points which afford the necessary facilities, in fact some ingenuity on the part of the officers in charge would make this possible on a small scale at the most of the hatcheries, especially where the waters do not reach too high a temperature. While it would be too costly to attempt this work on a large scale, it might be stated that at Restigouche, N.B., a fair-sized pond for the retaining of salmon until they are four months old has proved very successful, and at Newcastle and Ottawa, Ontario, it is also being done on a smaller but very successful basis.

COLLECTION OF OVA.

This is a matter that requires the most careful and untiring efforts of all the officers connected with the Fish Cultural work in the Dominion. On the efficient performance of this most important detail hinges the success or failure of a season's operations. The greatest care and attention must be given to the proper impregnation of the egg, as it is this first step that makes or mars the operations. It is reasonable to attribute even the comparative small percentage of loss at the Dominion hatcheries to the too hasty performance of this detail, and the necessity for the greatest of care in attending to the proper impregnation of the egg cannot be too strongly impressed upon the officers having charge of this work.

Whilst the object desired by all is to fill the respective institutions to their full capacity, still this should not be accomplished at the sacrifice of a large number of eggs which will most assuredly result if the eggs have not been properly fertilized. While on this question and coupled with the numerous public demands for the establishment of additional hatcheries the serious question of spawning beds arises. Where is the large supply of eggs required for hatchery purposes to be secured? This is a phase of the question that does not enter the public mind, but it is a great source of concern to the officers of the department.

There are salmon and salmon trout hatcheries throughout the Dominion to be provided for and when considering the question, it will be easily understood why anxious moments are often experienced by the officers connected with this service. The time has arrived when attention must be given to the providing of a departmental lake for the retention of salmon trout from which the department can always rely for securing a full supply of eggs of this species. To accomplish this a suitable lake should be selected, cleaned of all other predaceous species and stocked with salmon trout. This will cost money, but resources showing a value of twenty-nine millions of dollars annually are worthy of being fostered.

DISTRIBUTING FRY.

In my report of last year, reference was made to the stocking of lakes by localities instead of planting small quantities of fry over widely scattered areas. This suggestion

SESSIONAL PAPER No. 22

has been followed to a small extent, but the system of 'Applications for Fry' makes it difficult to carry out as fully as could be wished; but it is again strongly recommended that this system of distributing be extended as occasion offers.

Reference must be made to the impossibility of supplying applications for speckled trout fry. It is not possible to secure eggs from this species in large quantities, and the planting of these fry should be limited to only such public waters as have been entirely depleted.

ONTARIO.

Newcastle Hatchery.

The operations at this premier hatchery of the Dominion have again been successful. These are confined to the hatching of salmon trout, the eggs being secured in Colpoy's bay, Georgian bay. A small bass pond is also operated in connection with this institution. The rearing of fingerling salmon trout on a small scale has also been very successful.

Ottawa Hatchery.

As stated on previous occasions, this hatchery while turning out large quantities of fry is more of an experimental station at which fry of the various species are reared in the aquaria and their habits noted.

Whilst speckled trout have been incubated at this establishment it is not considered advisable to continue hatching this species at this institution, as owing to the high temperature of the water the eggs hatch prematurely, which causes considerable loss. During the past year some eighteen thousand persons visited this establishment.

Sandwich Hatchery.

At this institution whitefish and pickerel are the only species handled. Last year some sixty-three millions of whitefish and twenty-five millions of pickerel were distributed from this establishment.

Bass Ponds, Bay of Quinte.

It appears that the applications for small-mouthed black bass are increasing each year, so much so that it is impossible to commence to fill them all. The hatching of bass in artificial ponds has proved successful, and the work might well be extended at such points as offer the necessary facilities, bearing always in mind the danger, if great care is not taken, that these predaceous fish are not introduced into trout lakes, which would mean the extermination of the trout. On this account applications for bass should be inquired into closely as one planting of bass would create loss and endless trouble.

The past year's operations have been very successful and some fine specimens of young bass are now being distributed.

QUEBEC.

Gaspé Hatchery.

This establishment is devoted entirely to the hatching of Atlantic salmon, the eggs being procured from the salmon retaining pond at St. John, N.B. The operations for the past year have been successful and the fry have been distributed in rivers adjacent to the hatchery.

Tadoussac Hatchery.

This hatchery has again experienced another successful season and over two millions of salmon fry were distributed. A subsidiary hatchery was last season erected on the

6-7 EDWARD VII., A. 1907

Ste. Marguerite river, which was necessary as a means of stocking this stream. It obviates the necessity of conveying the young fry to a river difficult of access which was in the past a very hazardous undertaking.

Magog Hatchery.

This hatchery was last season largely filled with gray trout eggs, taken in Lake Memphremagog, and salmon trout eggs from Georgian bay. Some speckled trout from the St. Alexis waters were also successfully incubated. Waters of the Eastern Townships are now showing beneficial results from this institution. It might be mentioned that sea salmon planted in Lake Memphremagog have been caught by fly-fishing during the season just closed. In addition to the quantity of fry distributed from this hatchery to the various waters named in the report of the officer in charge, some two hundred and fifty thousand fry were transferred to the rearing ponds at Lake Lester.

St. Alexis Hatchery.

This hatchery is almost entirely devoted to the hatching of speckled and marstoni trout but some sea salmon are also incubated, and those distributed last season appear to be thriving. Great difficulty is experienced in securing the trout eggs, owing to the almost inaccessible location of the hatchery, but in the face of these difficulties the required number were secured last year and a successful season resulted.

Lake Lester Rearing Ponds.

The success attending the establishment of rearing ponds on this lake has surpassed all expectations. Last season some two hundred and fifty thousand fry of the various species were held in the ponds until they averaged from three to four inches in length, when they were distributed. At the present time some two hundred and fifty thousand fry are doing remarkably well. The success of these rearing ponds may safely be attributed to the ample supply of spring water and the careful attention paid to the fry by the officer in charge.

Lac Tremblant Hatchery.

On Lac Tremblant a small hatchery for the stocking of this and adjacent waters has been in operation for the past two years. Salmon trout with a small proportion of speckled trout are the principal species handled. The operations last season were successful, and this season an effort will be made to secure some trout fry from local waters.

NOVA SCOTIA.

Bedford Hatchery.

This establishment is supplied with salmon eggs from the retaining pond at St. John, N.B. A few speckled trout eggs have been incubated, but it is advisable that the work at this hatchery should be almost entirely in the direction of assistance to the salmon fisheries. Very gratifying reports have been received from different points in the province on the splendid results accruing from the stocking of rivers from this hatchery.

Margaree Hatchery.

Last season's operations at this hatchery were very successful and the salmon rivers in which fry have been planted are said to already be showing the beneficial results of establishing this institution. Over nine hundred thousand healthy salmon were last season distributed in Margaree, Little, Middle and Baddock rivers. The eggs for this establishment are provided from the St. John Pond and, notwithstanding

SESSIONAL PAPER No. 22

the fact that the Margaree hatchery is a difficult point to reach with green eggs, the results show that with care in packing and handling the eggs the percentage of loss is no greater than at other hatcheries.

Windsor Hatchery.

Last season was the initial one at this institution and the expectations for successful operations, as mentioned in my last report, have been realized and five hundred and seventy-five thousand salmon fry were planted in the waters of Hants, King's and Colchester counties. At this establishment a small plant for the hatching of shad was installed. The task of securing the shad eggs was entrusted to one of the most efficient officers in the service, but owing to the extremely delicate formation of the shad egg, transportation and the high temperature of the water available, the experiment was not as successful as could be wished. The eggs hatched and premature fish were the result. The eggs were secured in the Nictaux river and another season it will be necessary to erect a temporary structure for hatching these fish at the point at which they are secured. The delicate fibre of the egg will not stand transportation. This is the first time that the hatching of shad eggs has been attempted in Canada and whilst the results were not successful in the quantity of fish hatched, a great deal of experience was gained which will be of benefit for future operations in this direction.

Lobster Hatcheries.

The institutions in this province for hatching lobsters are located at Bay View and Canso. The past season was not as successful in point of numbers as heretofore, owing to the stormy weather and prevailing high winds, which kept the lobsters off the coast as well as preventing the fishermen from attending regularly to their traps.

NEW BRUNSWICK.

Restigouche Hatchery.

The operations at this establishment during the past season have been most satisfactory. The majority of the salmon eggs are procured from fish captured under departmental supervision whilst they are ascending the Restigouche river, the balance required being supplied from the retaining pond at St. John. The rearing pond in connection with this establishment is most favourably commented upon. At the present time some fifty thousand young salmon hatched last spring are now in this pond and will be distributed later on in the season.

Miramichi Hatchery.

This hatchery has been doing excellent work for many years and the salmon rivers adjacent thereto afford large returns to both the actual fishermen and the angler. This building was erected as far back as 1874, and no large expenditure has been made on repairs since that time. For several years past the department has appreciated the necessity for extensive repairs and alterations at this place, but the needs of other places where no fish breeding operations were conducted were so pressing that such alterations were postponed from year to year, until now repairs are an actual necessity and action in this direction is now engaging the attention of the department. It will be noticed in the report from the Officer in Charge (Mr. Isaac Sheasgreen) that, following the suggestions made in my report of last year on the distribution of fry, more attention has been paid to the main streams, in which quantities of fry have been placed, instead of carrying them long distances in wagons over rough roads to the smaller tributaries. In this way the work of distribution has been accomplished at a largely reduced expenditure and the results should prove just as beneficial.

St. John River Hatchery.

Last year reference was made to the extensive repairs that were imperative at this establishment before another season's work could be commenced. These repairs

6-7 EDWARD VII., A. 1907

are now under way and will be completed before the time arrives for placing the eggs in the troughs this fall. The operations last season were satisfactory, some one million three hundred thousand salmon eggs being distributed from this establishment.

Salmon Pond, Little River.

Reference has already been made to the necessity for abandoning the old site used as a retaining pond in St. John harbour. It is not an easy matter to find a place suitable in all respects for this purpose, and after careful inspection Little river was chosen as offering what appeared to be the most suitable facilities for the location of a pond, and temporary arrangements were made for trial of one year before any permanent work was effected. Whilst answering the purpose it has not proved ideal and another site more affected by the ebb and flow of the tide would be more suited to the purpose. It might be here explained that the fish retained in this pond are purchased direct from the commercial fishermen, who perhaps do not thoroughly appreciate the necessity for the utmost care being taken in handling salmon designed for retention in a comparatively fresh water pond. Any abrasion that may occur will not heal on salmon retained in a comparatively small area of fresh water reaching a high temperature, whilst in a pond affected by the tide to a greater extent than the one here alluded to such abrasions will heal in a fairly short time.

Lobster Hatcheries.

The lobster hatcheries in New Brunswick are located at Shemogue and Shippegan. The same remarks made on the Nova Scotia institutions apply here. The rough weather and high winds prevented the collection of as large a quantity of eggs as was hoped for, but those that were secured were successfully incubated, and the young lobsters were distributed in a healthy condition.

PRINCE EDWARD ISLAND.

Kelly's Pond Hatchery.

The season just closed was the initial one at this institution. The operations resulted in the distribution of seven hundred and twenty thousand salmon. This season efforts will be made to secure some sea trout eggs and arrangements in this direction are now being made.

Lobster Hatchery.

The hatchery for this purpose is located at Blockhouse Point, Charlottetown harbour. Similar reports to those received from Nova Scotia and New Brunswick have also come to hand from this institution. Spawn lobsters are reported as being limited in number but such eggs as were procured hatched out in splendid condition, the result being the distribution of forty millions of healthy and thriving young lobsters.

MANITOBA.

The two hatcheries for the incubation of whitefish located on Lake Winnipeg were not in operation last season, the cause being such an early closing of navigation on this lake, that it was impossible to convey the eggs to the hatchery. Full reports from the officers having this work in hand were embodied in my last year's report. It is hoped and expected that the coming season will see both of these institutions running to their full capacity.

BRITISH COLUMBIA.

In my report of last year, reference was made to the fact that a competent officer had been placed in charge of each one of the hatcheries in this province, who is held responsible directly to the department at Ottawa instead of to the Inspectors of Fisheries. This change in the system is working well and the service is as easily and as efficiently operated as in the eastern provinces.

SESSIONAL PAPER No. 22

Harrison Lake Hatchery.

This is the largest and best equipped institution in Canada, and thirty millions of eggs can be handled each season if it is possible to secure them. Last season twenty-eight million seven hundred thousand young salmon were released from this establishment. The work of capturing parent fish for the current season's operations is now under way.

Rivers Inlet Hatchery.

Last year, the opening season operations were successfully conducted at this hatchery by Mr. Wm. Roxburgh, the officer in charge. Great difficulties were encountered, but a successful distribution of eight millions of salmon fry is the gratifying result of the season's work.

Skeena River Hatchery.

This hatchery has been in operation since 1894 and has been most successful. Last season nearly four million young salmon were distributed. This establishment is difficult of access and is in a very isolated part of the province.

Granite Creek Hatchery.

This hatchery can always be relied upon for a big output of fry in the years of a big run of salmon. The operations are generally successful and last season was no exception to the rule, nearly eleven millions of young salmon being distributed.

Fraser River Hatchery.

This establishment has been in operation for nearly twenty years and during that time has been of great benefit to the salmon fisheries of British Columbia. Since the incumbency of the present officer-in-charge, Mr. J. A. Johnson, small rearing ponds have been provided and other improvements carried out. Last season a quantity of the surplus eggs from the Pemberton and Granite Creek hatcheries were transferred to this establishment, and over nine millions of fry were distributed from this hatchery during the season just closed.

Nimkish Hatchery.

A report on the operations at this establishment which is owned and operated by the Alert Bay Canning Co. B. C. Packer's Association, will be found with the annual reports from the officers-in-charge of the Dominion Government fish hatcheries which follow this report. Nearly five millions of fry were successfully distributed last season.

GENERAL REMARKS.

The growth of the fish-breeding service throughout the Dominion during the past few years has been large. Since 1903, thirteen new hatcheries have been put in operation, making a total of thirty-two institutions used for this purpose at the various points. The superintendence of this service involves an immense amount of clerical and inspection work, especially at new hatcheries where the officer-in-charge is inexperienced and has to be instructed in every detail. The conditions existing at the various points where these establishments are located vary so much, that instructions suited to each place must be prepared. Many and varied details and contingencies must be provided for and a wrong move at any time places the whole season's operations in jeopardy. To meet this large increase in the work, Mr. Alex. Finlayson, an officer of long and varied experience, both in Scotland and in the fish-breeding service of this country, was chosen and appointed to the position of Dominion Inspector of fish hatcheries. The duties of his office are to inspect the various establishments, instruct new appointees and report on the management of each establishment generally. All the officers connected with this service have taken great interest in their work and can be given a large share of credit for the success attending the past season's operations.

I am, sir, your obedient servant,

F. H. CUNNINGHAM,
Dominion Superintendent of Fish Culture.

ANNEX B.

REPORTS OF ALL THE HATCHERY OFFICERS.

1. BON ACCORD HATCHERY.

NEW WESTMINSTER, B. C., October 2, 1906.

Professor E. E. PRINCE,
Dominion Commissioner of Fisheries,
Ottawa.

SIR,—The past year at the Bon Accord hatchery has been very satisfactory and the hatchery had a very successful year.

In July, 1905, fences were put on the streams at the head of Pitt lake, but the freshets were too much for these strongly-built structures and washed the entire capturing plant out. Before the freshets abated sufficiently to allow the rebuilding of the fences, the fish had passed and reached the higher reaches of the rivers. One hundred thousand sockeye eggs were taken in Upper Pitt.

This necessitated looking to other grounds for the supply of spawn, and Granite Creek hatchery was drawn on for 3,000,000 eggs and Pemberton Meadows hatchery for 4,500,000 eggs. The Bon Accord hatchery staff secured 2,000,000 cohoes in the Nicomekl and Serpentine waters, 100,000 in the Hatchery creek, 1,500 trout in the Hatchery creek, and 5,000 steelheads in Stave river; the last mentioned are still in the hatchery but are now hatched out.

The loss was very small, the majority of the fish being particularly healthy.

On January 31, the first distribution of the fish commenced when 3,560,000 fry were placed in the Upper Pitt river, and other shipments followed closely, Lillooet river, 1,500,000; Silver creek, sockeyes, 1,000,000, cohoes, 500,000; Coquitlam river, sockeyes, 750,000, cohoes, 1,250,000; Cowichan lake, 80,000; Sauch-en-auch creek, 60,000; Serpentine creek, sockeyes, 60,000, cohoes, 60,000; Squamish, 60,000.

An experiment was made in the planting of salmon fry on the west coast of Vancouver island, and the fish were taken from Bon Accord hatchery to make the experiment. Two hundred and fifty thousand small fish were distributed among Anderson, Sprott and Kennedy lakes on the west coast of Vancouver island, and twelve hundred trout were placed in Price lake near Victoria.

The planting of the sockeye fry on the west coast of Vancouver island, although a new feature in fish culture here was a very successful experiment, as all the fish although subjected to the roughest weather, were in a most healthy condition when liberated.

The prospects for the coming year are very bright and there is little doubt that the hatchery will have its capacity of eggs.

I am, sir,

Your obedient servant,

J. A. JOHNSON,

Officer-in-Charge, Bon Accord Fish Hatchery.

SESSIONAL PAPER No. 22

2. HARRISON LAKE HATCHERY.

HARRISON HOT SPRINGS, B.C., August 24, 1906.

E. E. PRINCE, Esq.,
 Dominion Commissioner of Fisheries,
 Ottawa.

SIR,—I have the honour to submit my report from this hatchery, for the present year. My last report, dated November 16, 1905, showed a total collection at that date of 31,160,000 salmon ova. We afterwards secured additional eggs, making the total 31,274,000, consisting of :

28,204,000	Sockeye salmon
2,510,000	Cohoe “
560,000	Spring “

31,274,000

of these 2,501,000, or nearly 8 per cent were picked out as unfertile or dead. The eggs and young fry did remarkably well, and the following distribution was made during March and April without loss, the fish going out in splendid condition

To Morris creek	16,000,000
“ Silver “	2,500,000
“ Trout “ and bay	10,272,000

Total distribution 28,773,000

Three ponds were made during the winter, to accommodate some of the fry, and have proved a great help. They cover an area of about 50 by 350 ft. and are supplied with water from the hatchery waste flume. All the fry that were put out at the hatchery, were allowed to work their way through these three ponds becoming thus, in a measure accustomed to outside conditions, while still protected from their enemies. For the collection of ova for the present season, in addition to the camps operated last year, it is proposed to put in fences and pens at Twenty Mile creek, where some sockeye salmon are known to run. The fences and pens at Silver creek and at Douglas creek are already in position and a few fish are in the pens at the former station.

The fences, &c., at Morris creek and at other points will be in place early in September and every effort will be made to secure as many eggs as possible, for this being an ‘off’ year hatchery work is all the more necessary and should be pushed to the utmost.

Since the distribution of the fry the interior of the hatchery has been given a coat of paint and this has greatly improved its appearance.

The public interest manifested in the hatchery and its operation is quite remarkable. Being located so close to a popular health and pleasure resort, accounts in a great measure for the streams of visitors. This past year we have had between three and four thousand visitors and our register shows names of persons from all over the world. In fact the premises are hardly ever clear of visitors and they call for an increasing amount of attention and it necessitates the building plant and surroundings being kept in a creditable state, and as far as the number of staff and means would permit, I have tried to keep the place at least presentable.

We have been somewhat handicapped in the work here, by the transfer of the more experienced men to the newer hatcheries and having to train new men to the work. This difficulty is increased by the number of collecting stations working at the same time, and these points being so widely scattered. However, I am pleased to report that I have been well supported by the staff on the whole, and that some of them have taken a most exceptional interest in the work and have done everything possible to ensure success.

I am sir, yours obediently,

THOS. ROBINSON.

Officer-in-Charge.

6-7 EDWARD VII., A. 1907

3. PEMBERTON HATCHERY.

LILLOOET, B.C., May 8, 1906.

PROFESSOR PRINCE,
Commissioner of Fisheries,
Department of Marine and Fisheries,
Ottawa.

SIR,—I herewith have the honour to submit my first annual report on Pemberton hatchery to your department. A report on this hatchery would not be complete without an account of its situation and the different ways of conveyance required to reach it.

Pemberton hatchery is situated four miles to the east of the lower extremities of Pemberton meadows, at the junction of Owl creek and the Birkenhead river, four miles above its confluence with the eastern branch of the Lillooet river, which in turn discharges into Lillooet lake. The hatchery lies as near as can be judged one hundred and seventy-five miles in a north-easterly direction from New Westminster, which is the home of the fishing industry in British Columbia. The route, however, one has to travel from there to Pemberton is very circuitous, starting with a railway journey to Agassiz, a stage drive of five miles brings you to Harrison Hot Springs, where the splendid Harrison hatchery, built last year by the Dominion government can be seen four miles up the lake. The next stage of the journey is one of forty-five miles by the Harrison lake to Port Douglas, which is now but a relic of its former days, when this was the route to the Cariboo diggings.

The traveller now has to resort to a more primitive mode of travelling, and by the time he reaches Tenas lake, thirty-five miles from Douglas, he will be heartily glad to exchange his Indian cayuse for a seat in the canoe, if he has not been accustomed to riding. Tenas lake is six miles long and very narrow, being rather a widened part of the Lillooet river than a lake. At its head it narrows down to a swift river again, a mile of which brings one into Lillooet lake, sixteen miles in length. When half the lake has been traversed in a northerly direction it takes an abrupt turn to the west and from here the first view of Pemberton meadows can be had. When the river is high the canoe can be taken six miles up the river to the rancherie, but usually one has to land at the head of the lake and ride the remainder of the way, ten miles, to the hatchery.

The Birkenhead river, on which the hatchery is situated, is considered by competent authorities, to be the best sockeye spawning stream in British Columbia, and is unlike other spawning grounds in the respect that there is said to be a good run even in off years.

After the site and construction of the hatchery had been decided on, the contract for the lumber was let to Duguid & Hurlay, of Lillooet, who deserve credit for the manner in which they surmounted the difficulties incidental to bringing a 23,000 lb. saw-mill outfit, the 36 miles by raft on Seton and Anderson's lakes, and 24 miles of mountain road to Owl creek. They were three weeks on the road coming in and the same going out: the boiler alone weighed 6,000 lb., and they were engaged four months in sawing the 170,000 feet and planing 130,000 feet of lumber of which the buildings were constructed. Mr. Forrester, the building superintendent, started actual construction in May, though previous to that he had a gang of Indians employed clearing the site, making roads and hewing the sills. One could hardly imagine a rougher spot than that on which the hatchery now stands: in addition to the large trees which were sawn for lumber and their stumps blown out, the ground was covered with large boulders brought down by Owl creek in ages past.

The hatchery is a one-story building 40 feet by 150 feet long with 12-foot walls; it has 12-inch cedar foundations, 2-inch by 8-inch joists, 2-inch flooring and 2-inch by 6-inch studding, the roof is built on the truss system, which obviates the need of posts in the centre and consequently gives a clear floor space from wall to wall; the

SESSIONAL PAPER No. 22

building is sheathed with shiplap and rustic on the outside and lined with 6-inch V-joint inside ; it is lighted by 27 large windows and 12 3-ft. by 8-ft. skylights, and is roofed with Elalorite fireproof roofing. The exterior is painted cream with white trimmings, and the interior white.

The hatching apparatus is thoroughly up to date in every particular. A head tank, 18 inches by 18 inches runs the entire length of the building, and the hatching troughs, 112 in number, 16 feet long, 16 inches wide and 6 inches deep, built of 2-inch plank are arranged in groups of four, with a fall of 6 inches between the upper and lower pair. Water is supplied to the troughs from the head tank through $1\frac{1}{2}$ plugs. The waste connections are 2 inch diameter and the waste ditches are 6 inches by 6 inches and 6 inches by 16 inches. The troughs, which are painted white outside and lacquered inside, hold six 16-inch by 24-inch baskets each and riffles are provided between each basket.

A floating gauge in the head tank connected to an electric circuit communicating with the boarding house rings an alarm there when the water either rises or falls an inch. This is the first electric tank alarm installed in a British Columbia hatchery. The boarding house, which is painted the same as the hatchery, is a two-story frame building, 16 feet by 24, with an addition containing kitchen, pantry and bath room. The main building contains dining room, 12 by 16, office 10 by 12 and hall ; upstairs there are four bedrooms. The interior is varnished, and hot and cold water is supplied to a sink and bathroom. A pipe line of 600 feet supplies the water.

There are also a workshop and wood-shed, 14 feet by 20 feet and 12 by 20 feet respectively, sheathed with rustic and painted uniform with the main buildings. The flume for the supply of water to the hatchery leads from a dam situated 400 feet up Owl creek ; it is built of 2-inch by 16-inch, 2-inch by 14-inch and 2-inch by 12-inch 2-inch plank. It is the largest at the intake and is tarred outside and in, half way down it is broken by a 10-inch cedar log settling tank, 10 feet by 30 feet by 5 feet deep. It is at present being roofed over. There is also an emergency flume extending 150 feet further up Owl creek to a dam there in case of accident to the main one.

The work done by Mr. Forrester is creditable both to the department and himself, and his efforts to have the hatchery finished by August 1 were rewarded by the water being turned on for the first time on that date in spite of unforeseen circumstances and difficulties. In the meantime the building of the traps for the taking of the parent fish had been under way for some time. They were located 200 yards above the hatchery on the Birkenhead, at a point where there was a large rock on both sides to protect the banks. The main fence was built on the tripod system. Ten tripods made of 7-inch fir poles were placed at regular intervals across the stream and filled with rock. The height of water—four feet—made the job an arduous one. The large boulders in the bed of the stream which could not be seen, though their effect on the water was plainly visible, contributed to the difficulty. After two weeks' exertion, during which time dry clothes were almost an unknown quality, the tripods were placed in position and the stringers fastened down. The fencing proper consisted of sections 6 feet by 12 feet, made of 1-inch by 4-inch on edge, and bolted together, and had been under construction while the tripods were being placed. They were laid on the stringers with a 2 to 1 slant lying down stream, and had a yard of heavy duck-canvas nailed along the heel of them to prevent the salmon burrowing ; rock was then placed in front, the pens anchored and leads built from the fence to them. There were fifteen pens in use altogether of different sizes, 12 feet by 12 feet, 10 feet by 12, and 6 feet by 12. Two more fences were built after this before the run came, one 100 yards below the first one to keep the salmon from drifting down. When the run was at its height a section of this fence had to be taken out to prevent the fish crowding too much though the space between the fences was 100 ft. by 200 feet with about three feet of water. Another fence was constructed, one and a half miles above the hatchery, as a safeguard against mishap to the lower ones.

The first sockeye arrived on August 15, but not until the 27th did the run fairly get here ; on the morning of that date the pens hardly had 100 fish, but by night it was found necessary to close the leads to the pens to prevent overcrowding. From the 27th

till September 8, the leads were hardly opened, as it was found that the salmon would not stand peining. The first spawning of 100,000 ova was made on September 4, but all the fish were not in a ripe condition; on the 8th 1,000,000 were taken.

Spawning started in earnest on Monday, the 11th, and by the end of the week 8,500,000 were secured. Mr. Cunningham, superintendent of fish culture, arrived on the 15th and left on the 17th, and inspected the spawning operations and hatchery; he was accompanied by Messrs. Forrester and Finlayson. By the end of the week ending September 23, the total in the hatchery was 21,350,000, 2,500,000 being spawned by four spawners in one day.

At this time twenty men were employed. A freshet on the 21st washed a number of salmon over the lower fence and down the river, where they spawned naturally. Altogether 28 millions of sockeye ova were taken, one and a half millions of them at the mouth of the river by means of a seine. The coho run did not come up to expectations, only 600,000 ova being spawned and practically all the fish were taken in traps.

During the run of sockeye the males outnumbered the female fish five to one; they were only blocking up the pens, so I gave the Indians liberty to take all they wanted. They took over 4,000 from first to last. The Indians, I may say here, have given no cause for complaint so far. The only thing I can say against them is that their charges are extortionate.

As you are aware, Mr. Johnson, officer in charge of the Fraser River hatchery, received two shipments from here; the first lot of two and a half millions he took out himself; Messrs. Davis and Martin took down the remainder. A shipment of 4,330,000 also went to the H. L. hatchery in charge of Thos. Graham, of the staff of that hatchery. In consequence of these shipments leaving, there were several empty troughs in the hatchery. To relieve the congestion in some of the baskets which contained 50,000 ova, I am redistributing the remaining eggs over the whole hatchery at the rate of 30,000 to the basket. The main fence is still in the river; there are a few coho lying below waiting for a rise in the river; they only travel during a freshet.

Since October 1, an average of four men a day have been picking the 20,000,000 which the hatchery now contains. We are engaged at present building troughs to hold the surplus fry. I intended building outside ponds, but came to the conclusion that to do so without building a roof over them, for which we had no time, would only be courting disaster considering the snowfall of 3 to 4 feet. The troughs we are building are 12 feet long and 2 feet wide, with a partition down the centre which makes two troughs of it. They are placed beneath the hatching troughs on the floor, the waste from which passes along one side through an overflow and back the other side, making a return to the same end that it enters from, but with the partition between. There will be twenty-seven of them built this winter, and if they work well, and I believe they will, twenty-seven more could be placed beneath the upper run and fed from the head tank. They will have one advantage over outside ponds in that they will be easier kept clear of ice and snow, as the hatchery has two heaters in it now.

The experience gained this year will be of great use another season. Though the practice of holding fish in pens works well on the lower spawning grounds, I find that it fails here. Several fences are wanted in the river at the hatchery forming pools where the fish can be held. The upper fence should be high and strong and with pens in connection to spawn out of. About 200 yards down another fence should be thrown across and the first run of salmon allowed to enter and then closed up; 200 yards farther down the process could be repeated and even a fourth fence put in, if necessary; by this means the fish would mature even more than was the case this fall, when the fresh run and mature salmon were mixed up between the fences. I also found that large numbers of sockeyes spawn between the hatchery and the mouth of the Birkenhead. The early run of sockeye pushes on to the head waters of the streams they frequent; the subsequent schools run till they come up with the preceding one, and so on, and the late ones content themselves by spawning on the first bar they encounter. A fence put in during the latter part of the season at the mouth of the river would take a large number of fish that would otherwise never ascend to the upper fences, and the ova taken there could be sent direct to the lower hatcheries.

SESSIONAL PAPER No. 22

The first season at a new hatchery is always the worst, as the spawning conditions vary in streams a few miles apart, and a system which works well in one may prove a failure in another. But I would like to say that the staff of seven have done their best to make it a success, and so also has the local help employed.

The result of the season's work at this establishment consisted of a total distribution 17,450,000 of healthy fry.

I have the honour to be, sir,
Your obedient servant.

ALEXANDER ROBERTSON,
Officer in Charge.

4. GRANITE CREEK HATCHERY.

KNALT, B.C., August 22, 1906.

Prof. E. E. PRINCE,
Dominion Commissioner of Fisheries,
Ottawa.

SIR,—I have the honour to submit the following report on the operations at this hatchery during the past season. The eggs were collected between August and December and were disposed of as follows:—

Sockeyes from Scotch creek.....	12,920,000
“ Adams river.....	3,448,000
“ Granite creek.....	1,610,000
	<hr/>
	17,978,000
Cohoos from Granite creek.....	240,000
	<hr/>
Total salmon ova.....	18,218,000
Of those. 3,625,000 eyed.	
And..... 875,000 uneyed eggs, were sent away.	
	<hr/>
	4,500,000
1st shipment to Fraser river hatchery—	
Uneyed sockeye.	875,000
Eyed “	125,000
	<hr/>
	1,000,000
2nd shipment to Fraser river hatchery—	
Eyed sockeye.....	2,000,000
Shipment of eyed sockeye to Harrison hatchery...	1,500,000
	<hr/>
Total ova shipped.....	4,500,000
Dead eggs picked out—	
Sockeye.....	2,804,000
Cohoos.....	26,000
	<hr/>
	2,830,000
Fry liberated.....	10,888,000
	<hr/>
Sockeye.....	10,674,000
Cohoos.....	214,000

These fry were released at the hatchery.

6-7 EDWARD VII., A. 1907

The nearest good place, being at the head of the Anesty, or north-east arm of the Great Shuswap lake, a distance of thirty-seven miles from the hatchery.

The upper seven-miles of this arm is ice bound until the end of March, and the spring storms on the lake make the distant distribution of the fry impracticable.

If the fry from Scotch creek ova would return to the Hatchery creek, and make another Morris creek of it, it would be a great advantage; Scotch creek being sixty-five miles distant, and on an Indian reserve, where difficulties with the Indians have to be obviated.

The first sockeye arrived at Scotch creek on August 12.

On the 15th six others put in an appearance.

The first shipment of ova was sent to the hatchery on August 24, and began to hatch on October 25.

On December 10, sockeye were still spawning in the Little river, between the Great and Little Shuswap lakes. Traps were first put in on Granite creek, Scotch creek, and the Anesty river: but the run of fish was so heavy, that at Scotch creek, all available trays were required, and the Anesty fish had to be admitted to the river.

There were two distinct runs, the last was of smaller fish, with pale flesh.

They were very soft, and possibly the paleness of their flesh was due to their ripeness.

Many of this last run reached the Hatchery creek at the extreme end of the Shuswap lake.

Many humpbacks came with the sockeye to Granite creek where they had never been seen before.

This second run made a great rush for Adams river, it being the first stream they encountered on reaching the lake, and a trap was put in the smaller channel; the main channel of Adams river, being a large swift stream, could not be used without great expense.

Great numbers of these fish spawned in Little river, below the Great Shuswap lake, and for miles along the lake shore, at its lower end.

This fall there will be a small late run at Adams river.

The mud in Granite creek is a great annoyance, and last season two men were steadily employed for two months keeping the mud washed out of the troughs.

This deposit of mud was so heavy that in fourteen hours, the ova in the baskets was not visible.

The creek flows between steep banks of clay and fine micaceous silt, and is blocked to its source with limbs and brush, which catch and hold the dead leaves falling into it during the autumn.

This accumulation of dead leaves catches the clay, which heaved by the frost, washes from the banks in the spring.

As these leaves decay and disintegrate, they keep ever coming down, releasing the successive layers of mud.

TROUT.

During May, 1906, 75,000 eggs of the *Salmo Kamloops* were taken at Skimekin creek.

This creek flows into Skimekin lake, which was stocked with trout fry from ova taken at Canoe and Granite creeks.

The fry this season were liberated in Granite creek; it having become exhausted as a spawning ground of the *Salmo Kamloops*.

Parties of anglers who visited Skimekin Lake this season secured good catches, many of the fish weighing $3\frac{1}{2}$ to 7 lb.

Your obedient servant,

D. S. MITCHELL.

5. SKEENA RIVER HATCHERY.

Prof. E. E. PRINCE,
Dominion Commissioner of Fisheries,
Ottawa.

SIR,—I have the honour to submit herewith my fourth annual report of work done at the Skeena river hatchery for the season 1905 and 1906.

On July 17, I arrived at the hatchery accompanied by Messrs. A. W. Pretty, J. B. Johnstone and S. Whitwell after ten hours hard poling up the Lakelse river.

On the 22nd, I paid a visit to the spawning grounds at the head of Lakelse lake, which is about eight miles from the hatchery, and found a few sockeyes up there. I then returned to the hatchery and began preparations for getting everything ready to move up to Sockeye river.

On August 1, we left the hatchery for the spawning grounds with some supplies and material for our traps, fences, &c., and by the 9th we had placed in position about 280 feet of fencing, also our traps.

I then returned to the hatchery leaving Messrs. Pretty, Johnstone and S. Whitwell up at the spawning grounds, to get additional stakes, rock, &c., to make the fences secure.

On the 11th, I noticed several spring salmon spawning in Lakelse river and Coldwater creek.

On the 14th, by permission of the department, I engaged Messrs. E. and F. Michaud to do some necessary work at the dam.

On the 19th, Messrs. Pretty and Johnstone came down from the spawning grounds and reported part of our fences washed out, I immediately returned with them taking Messrs. E. and F. Michaud and two Indians with us, and we got them placed in position again and on the same night we trapped several hundred sockeyes; next day we started spawning and got 176,000 eggs, which I took back to the hatchery.

Messrs. Pretty and Johnstone arrived on the 30th with another shipment of 48,000.

I then returned to the spawning grounds and, on September 3, we got 520,000; September 8, 592,000; September 14, 776,000; September 16, 1,016,000, and on September 21, 800,000. Altogether 3,928,000, filling every basket that the hatchery can accommodate. On the latter date we were very fortunate in getting the hatchery full of ova; as it rained very hard for several days causing a big flood which brought large cottonwood and spruce trees down the river, smashing our fences and carrying one pen of fish away entirely, containing several hundreds of ripe sockeyes.

On September 22, we caught two cohoes and noticed a good many in the river.

On October 1, we had another flood; in fact, nothing but floods and freshets since the 5th of August, which hindered us considerably in getting our fences and pens out of the river before the 4th of October, at which date all work at the spawning grounds was finished.

From that date we had heavy rains, and on November 13 we had the worst flood of the season; the water in the Lakelse river and Coldwater creek overflowed the banks and we had two inches of water on the hatchery floor. At one time it began to look serious, so much so that we had the canoe and skiff tied up to the hatchery in case anything should occur.

On November 16, the first fish hatched 88 days after spawning.

On December 1, nine inches of snow fell, only to be followed by heavy rains which lasted until January 9, and on the 21st we had a cold snap the thermometer going down to 12 below zero, from that time fine frosty weather with snow, and on January 24, 47 inches of snow on the level, but from that date until the first week in April we had fine frosty weather with occasional snow falls.

From the middle of January until the young fry were liberated the supply water for the hatchery kept in splendid condition but very cold, for several weeks the water in the tanks registered 32°.

I am very glad to say that the past season has been the most successful season that we have had, notwithstanding all the floods and disadvantages we had to contend with.

I adopted a new plan of picking the eggs all through the hatchery twice a week and turning all of them every day, which I found a great success, doing away with all signs of fungus, so much so that the percentage of bad eggs picked out has been less than 4 per cent.

On April 4, we planted 500,000 young fry in Coldwater creek.

April 17, 1,000,000 on the parent spawning ground at Sockeye river.

April 18, 500,000 in Sockeye river.

April 18, 1,784,450 in Lakelse river and Coldwater creek, making all together 3,784,450 young fry liberated.

April 4, Coldwater creek.....	500,000
“ 17, Sockeye river.....	1,000,000
“ 18 “ “.....	500,000
“ 18, Lakelse river and Coldwater creek....	1,784,450
Bad eggs picked out.....	143,550
	<hr/>
Number of eggs put in hatchery	3,928,000
	<hr/>

On April 19, I left Mr. J. B. Johnstone to take charge of the hatchery and Messrs. Pretty, J. Williams, S. Whitwell and self left in a canoe with Indians for Port Essington, a distance of 75 miles, which we accomplished in 12 hours. We then had to wait three days for a steamer, whence we proceeded to Vancouver and Victoria, where we arrived on the 25th.

In conclusion, I may state that there will have to be another small expenditure at the dam this coming season; in fact, it appears to me that there will have to be a small outlay expended every year after the floods, on account of the low banks and the surrounding country being overflowed.

I remain

Your obedient servant,

THOS. WHITWELL,

Officer in Charge.

6. RIVERS INLET HATCHERY.

RIVERS INLET, September 5, 1906.

Professor E. E. PRINCE,
 Dominion Commissioner of Fisheries,
 Ottawa.

SIR,—I beg to lay before you a report on the hatchery built on O-wa-Keeno lake (Rivers Inlet) in 1905. We commenced work on a trail from the head of Rivers Inlet of the Wannuck river, to the head of the rapids on said river a distance of about 3 miles, we then proceeded to the site selected for the hatchery which was so rough with large stumps, rocks and fallen trees it would have taken all summer to clear it; and with so many men on the ground, and carpenters unable to go to work at once, I decid-

SESSIONAL PAPER No. 22

ed to go a little closer to the lake shore. I was able to get a contract made with the Indians to carry our lumber from the mill to the hatchery, but we had much difficulty to get them to fulfil the agreement as it is a very rapid running river. We had very favourable weather while the building was in course of construction, but when nearly finished the rain came on, and the water came under and around the building rising nearly to the floor mixing lumber, logs, and roots in dire confusion; luckily the lake did not keep high for any great length of time and we got things in fairly good shape again. The building itself did not suffer badly from the fire which I reported and without any outside help we got it restored and repainted, and the traces of the fire are now scarcely visible.

After the high water of 1905, I set about building a crib around the hatchery which is now well advanced. This was no easy matter as the rock is of such an immense size in the neighbourhood of the hatchery that we had either to blast or bring it a great distance. The creek, which supplies the hatchery is, when high, a perfect torrent and as rocks and huge boulders have been accumulating in its present bed, causing it to overflow and threaten the building (when high) is still dangerous, but we have blasted out and levelled some of the worst places, though much work remains to be done.

It may look as if a blind selection of a site had been made but the sites in the first 20 miles of the lake are all subject to overflow and pretty much alike, and I see no other that excels or equals it in that distance. The lake is never at rest, either rising or falling; if you leave a boat on the beach she is either high and dry or pounding herself to pieces on the shore, and the mountains are so steep that when it rains, (*and it can rain here*) it pours down their sides into the ravines at their base and then up comes lake and river.

We commenced operations for collecting ova on August 20, 1905, putting fences in two creeks which I thought would give us a supply and could fence securely enough to withstand the freshets. By September 20, we had 3,000,000 eggs in the house. It then commenced to rain and washed our fences out. Our fences were very substantially built, and braced every way, and I believe could have withstood the pressure of the water, but when a tree or drift log came down, everything went before it and you have to recommence with most of your picket washed away and unable to be nearer than the mill. We did recommence and on October 20, had our complement of eggs in the house—10,000,000. We did not succeed quite so well as I had wished in rearing the ova. Our feed pipe for water lay on the bed of the creek with sand, small rock and even adult salmon at liberty to enter and choke it up, causing many interruptions and irregularity of the flow of water over the eggs in the house and when frost came the stopping of it altogether. However, we managed to avoid this and came out with an output of 8,000,000. The young fish were distributed on the lake shore in a radius of 2 miles of the hatchery, and amongst great quantities of the naturally raised fry which are there in great numbers in the spring of the year. The Owakeeno lake has a length of 47½ miles, the mountains coming abruptly into the lake with little or no shore for the first 20 miles. Out of every valley comes a creek or river of more or less volume, and the salmon divide and go up all of them, giving no great quantity of fish to any one stream, unless it be the very large ones. Some of these streams are so large we could not begin to fence them with our present methods, and they are so foul with driftwood and obstructions that you cannot use a net. A notable exception to this is the Nimpkish lake 15 miles long. In it there are no salmon streams till you get to the head where three rivers come in, and you have all the salmon in the lake close to your hatchery.

In conclusion I would state that we have to get some of our eggs 24 miles from the hatchery? If it comes a head wind it may be two days before they reach it, and in a crowded row or sail boat you cannot tell what treatment they receive, as the lake is subject to heavy and sudden squalls, and a heavy sea gets up. It would be to the interest of the industry that the department supply a small steamer to carry eggs and perform other useful work, and in these days of steam, electricity, gasoline, &c., I think one could be obtained at a moderate cost.

I have the honour to be, sir,

Your obedient servant,

WM. ROXBURGH,

Officer in Charge R. I. Hatchery.

7. NIMPKISH HATCHERY.

(Owned and operated by the Alert Bay Canning Co. B. C., Packers' Association.)

VANCOUVER, B.C., April 23, 1906.

Professor E. E. PRINCE,
 Dominion Commissioner of Fisheries,
 Ottawa.

SIR,—As per agreement with the Dominion government, we submit the report of operations of our Nimpkish hatchery for season 1905-6.

We stripped our first fish on the 30th day of September, taking 92,000 eggs, and continued taking eggs until the 11th day of October, all baskets then being full. We again started taking spawn on the 18th of October, more baskets having been received ; and filled all of them by the 21st October.

We are pleased to state that we took in all 5,037,000 eggs and that we turned out 4,873,400 healthy sockeye fry, showing a loss of a little over 3%, which we consider an excellent showing. Most of the young sockeyes were put into the Nimpkish lake. The supply of parent fish was ample—we having used only a small part of the supply. Our superintendent reports sockeyes spawning in the creek adjacent to the lake late in December.

The last of the young sockeye were put out on the 18th April.

Eggs received in hatchery.	5,037,000
Total loss of eggs picked out	162,000
" " dead fry	1,600
	<hr/>
	163,600
Sockeye fry planted in lake.	4,873,400
	<hr/>
	5,037,000
	<hr/>

Respectfully submitted,

B. C. Packers' Association.

WM. H. BARKER,
General Manager.

8. SANDWICH HATCHERY.

SANDWICH ONT., August 22, 1906.

Prof. E. E. PRINCE,
 Dominion Commissioner of Fisheries,
 Ottawa.

SIR,—I have the honour to submit to you my annual report of the operations conducted at the Sandwich hatchery during the past season.

Out of 75,000,000 whitefish eggs which were placed in the hatchery last fall, 63,000,000 young fry were hatched and distributed in the waters named below in a healthy and thriving condition.

Point Edward, Lake Huron.....	4,000,000
Peach island, Detroit river.....	2,000,000
Fighting island ".....	3,000,000
In bay below Fighting island.....	3,000,000
Stony island, Detroit river.....	4,000,000
Bois Blanc island ".....	7,000,000
In lake below Bois Blanc island.....	5,000,000
Pigeon bay, Lake Erie.....	4,000,000
Bar Point ".....	2,000,000
Colchester ".....	1,000,000
Leamington ".....	1,000,000
Rondeau ".....	1,000,000
Port Stanley ".....	1,000,000
Hamilton, Lake Ontario.....	1,000,000
Niagara ".....	1,000,000
Toronto ".....	1,000,000
Belleville, Bay of Quinte.....	1,000,000
In river at hatchery.....	21,000,000
Total.....	63,000,000

COLLECTING PICKEREL EGGS.

After the distribution of whitefish was completed we again filled up the jars with pickerel (doré) eggs which were collected from the pound-nets in Lake Huron. The number of eggs obtained was 50,000,000 from which were hatched 25,000,000 young fry and disposed of as follows:

Lake Huron.....	4,000,000
Round lake, Havelock, Ont.....	500,000
Belmont lake ".....	500,000
Trent river ".....	500,000
Burlington bay, Hamilton, Ont.....	500,000
Thames river, Bothwell, Ont.....	300,000
Sydenham river, Dawn Mills, Ont.....	300,000
Detroit river.....	18,400,000
Total.....	25,000,000

The above fry were placed in the waters in a first-class condition.

I have the honour to be, sir,
 Your obedient servant,

WM. PARKER,
Officer in Charge.

9. NEWCASTLE HATCHERY.

NEWCASTLE, August 21, 1906.

Professor PRINCE,
 Dominion Commissioner of Fisheries,
 Ottawa.

SIR,—I have the honour to submit herewith my report on the operation of this hatchery during the past year.

According to instructions I proceeded to Wiarton on the second day of October last, with the usual assistance, to procure the necessary supply of salmon trout ova for this and other hatcheries.

We succeeded in placing our nets for fishing on the 21st of October. We did not succeed in securing any great quantity of eggs until about the 7th of November ; it almost seemed at one time that a partial failure was in store for us, but I am happy to state the fish came on later than usual and by the time the season wound up, we had a full supply of ova for this and the other hatcheries.

I handed over to Mr. Walker 1,000,000 for the Ottawa hatchery, also 800,000 for Mount Tremblant on the 15th of November, also 300,000 to Magog hatchery, which left us with about 2,000,000 for the Newcastle hatchery which have done well and which appear in my report as to distribution.

Our hatchery is in fine condition and in good repair, I am now raising a number of yearling salmon trout and am placing two extra tanks at the spring to give them extra room to develop, and will, I consider, be a great advantage to the raising of young salmon trout.

We also have a goodly quantity of young black bass which will number about 2,000, and they, by all appearance, seem to be doing well and ready for distribution this fall.

Our plant at Wiarton is in good condition. Our spile driver will need fresh caulking and the nets overhauled ; outside of that, the expense will be nominal.

The following schedule will show the points of distribution, also the number of fry placed in each locality last spring.

Lake Ontario, Consecon	250,000
" Picton Sandbanks.....	300,000
" Newcastle.....	200,000
Lake Simcoe, Barrie.....	200,000
Lake Huron, Southampton.....	200,000
Georgian bay, Wiarton.....	200,000
Charleston lake, Athens.....	150,000
Rideau lakes, Portland.....	25,000
" Westport.....	25,000
Total.....	1,550,000

Two year old Salmon trout.

Charleston lake.....	300
Bay Quinte, Belleville.....	200
Total.....	500

I beg to inform you the fry were all deposited in the different waters in the very best condition.

I have the honour to be, sir,
 Your obedient servant,

WM. ARMSTRONG.

SESSIONAL PAPER No. 22

10. OTTAWA HATCHERY.

OTTAWA, August 18, 1906.

Profesor E. E. PRINCE,
Dominion Commissioner of Fisheries,
Ottawa.

SIR,—I beg to submit my annual report of the season's operations carried on at the Ottawa hatchery.

On November 10 last I received from St. John, N.B., through Inspector Finlayson about 125,000 Atlantic salmon eggs.

On November 15 I received from Mr. Wm. Armstrong about 1,000,000 salmon trout eggs.

On March 18 I received from the Magog hatchery about 75,000 gray trout eggs.

On the same date I received from the Bark River hatchery about 50,000 brook trout eggs.

On May 24 I received from the Magog hatchery about 100,000 speckled trout six weeks old.

All the above eggs were received and laid down in the incubating troughs in first-class condition, hatching out strong and healthy in the latter part of May and the first week in June.

The work of distributing the fry was very successfully done by Messrs. A. Halkett, J. B. Rochon, U. Grignon and S. J. Walker.

The young fry were all deposited in the undermentioned waters.

SESSIONAL PAPER No. 22

Total distribution of fry from the Ottawa hatchery closing the season 1905-06, was 1,223,000.

During the year about (18,000) eighteen thousand persons visited the hatchery.

The hatchery has been repainted and repaired and is now in readiness for next season's operations.

I have the honour to be, sir,

Your obedient servant,

JOHN WALKER,

In charge of Ottawa Hatchery.

11. MAGOG HATCHERY, P.Q.

MAGOG, August 31, 1906.

Prof. E. E. PRINCE,

Dominion Commissioner of Fisheries,
Ottawa.

SIR,—In submitting my annual report on the operations at this hatchery during the season of 1905-06, I have much pleasure in stating that the several species of fish eggs handled turned out very satisfactorily and the fry were distributed as follows:—

Salmon Trout.

Lake Suivant and Dudswell.....	15,000
" Noir.....	40,000
" Stoke.....	15,000
" Adstock.....	25,000
" des Poulins.....	15,000
" Dussault.....	30,000
" Ste. Modeste.....	25,000

Speckled Trout.

Lake Weedon.....	5,000
" Long.....	10,000
" at Cookshire.....	20,000
" St. Hubert.....	10,000
" Tortue.....	10,000
Rivière du Loup and Cleveland.....	15,000

Gray Trout.

Lake Megantic.....	75,000
" Broome.....	65,000
" Massawippi.....	60,000
" Memphremagog.....	100,000
" St. Francis.....	10,000
" Dennison.....	25,000
Libbey and Key Ponds.....	35,000

Atlantic Salmon.

Lake Memphremagog.....	10,000
" Massawippi.....	10,000

In addition to the above distribution 250,000 fry were transferred to the rearing ponds at Lake Lester.

The fry were all distributed in splendid condition

I have the honour to be, sir,

Your obt. servant,

A. L. DESEVE.

6-7 EDWARD VII., A. 1907

12. MONT TREMBLANT HATCHERY.

August 20, 1906.

Prof. E. E. PRINCE,
 Dominion Commissioner of Fisheries,
 Ottawa.

SIR,—I received, on the 15th November, 1905, 600,000 salmon trout eggs, and, on the 22nd February, 1906, 60,000 red trout eggs.

Of these were distributed : 500,000 salmon trout fry, and 55,000 red trout fry, in the following lakes :—

- Lake Tremblant ;
- “ Boisfranc, near Lake Tremblant ;
- “ Pimodeau, by Nomingue ;
- “ Wanish, Noir & Argenté, by Montford ;
- “ Supérieur, Sauvage & Paquette, by St. Faustin ;
- “ Charlebois and Masson, by Ste-Marguerite ;
- “ Cornu, by Nantel ;
- “ Labelle, Clair and Croche, by Labelle ;
- “ de Sable, at Ste. Agathe ;
- “ Mercier, near Mont Tremblant.

The fry were distributed in fine condition,

I have the honour to be, sir,
 Your obedient servant,

ALPHONSE ROBERT,
Officer in Charge.

13. ST. ALEXIS HATCHERY.

Prof. E. E. PRINCE,
 Dominion Commissioner of Fisheries,
 Ottawa.

SIR,—In accordance with your instructions, I have the honour to submit my annual report on the operations at this hatchery during the past season.

I may say that the work at this hatchery is almost exclusively devoted to the collecting and hatching of speckled trout.

The department is well aware of the difficulties to be contended with in securing large quantities of this species of fish.

However, I am glad to be able to report that (653,000) six hundred and fifty-three thousand eggs were collected and laid down in the troughs in good condition, the first fry appearing about the twentieth of April, and were distributed in the following waters :

Lac Patterson	15,000
“ Winchester	50,000
“ Vierge	20,000
“ Caribou	30,000
“ Des Six	38,000
“ Corolus	60,000
“ St. Jovite	20,000
“ La Peche	100,000
“ Sans Bout	50,000
“ Bonne Terre	20,000
“ Bluets	20,000
“ Boulanger	50,000
“ Three Lakes	20,000
Eyed eggs shipped to other hatcheries	150,000

SESSIONAL PAPER No. 22

I may say that all the fry were planted in good condition and the loss during incubation was almost nil.

I have the honour to remain, sir,
Your obedient servant,

JOS. ELLIOTT,
Officer in Charge.

14. BALDWIN'S MILLS REARING PONDS, QUE.

BALDWIN'S MILLS, Aug. 29, 1906.

Prof. E. E. PRINCE,
Dominion Commissioner of Fisheries,
Ottawa.

SIR,—I have the honour to submit the following report for the past year.

This establishment has been very successful in the rearing of fish so far, viz., gray salmon and speckled trout, ouananiche and Atlantic salmon and Pacific salmon. The parent brook or speckled trout now in the retaining tanks are looking fine and healthy, and the prospects are that a very much larger percentage of ova than last year will be procured.

From the 260,000 fingerlings on hand last fall, as previously reported, I delivered to Messrs. Deseve and Merry, of the Magog hatchery, which they report as being distributed in first-class condition as follows :—

Gray Trout Fingerlings.

Fall 1905.

Lake Memphremagog.....	35,000
Lake Massawippi.....	15,000

Salmon Trout.

Lake Memphremagog.....	35,000
Lake Massawippi.....	30,000

Salmon.

Lake Memphremagog.....	10,000
Lake Massawippi.....	10,000

Ouananiche.

Lake Croche.....	9,000
------------------	-------

Gray Trout.

Lake Lester (distributed by self).....	6,000
--	-------

Gray Trout.

Spring, 1906.

Lake Lester, per self.....	21,000
----------------------------	--------

Salmon.

Lake Lester, per self.....	69,000
----------------------------	--------

Yearlings, Salmon Trout.

June, 1906.

Orford Lake, per Messrs. Deseve and Merry 4,000

August, 1906.

Lake Memphremagog, per Messrs. Deseve and Merry 4,000

To be distributed as per orders.

Yearlings, Salmon Trout.

Lake Massawippi 2,000

I am also pleased to report that I received, June, 1906, in good order from Magog hatchery—

Salmon fry 75,000

Gray Trout fry 75,000

Salmon Trout fry 100,000

The road recently built by the department to this establishment has proved a boon, the distributing of fish, freighting, &c., is accomplished more easily now than by boat, as formerly.

Some 48 tons of ice were put in the ice house last winter. I find a large amount is required for distributing purposes and keeping fresh liver for food.

The fish in the rearing tanks have grown well, with very little loss, though not quite as large this season as last owing to the fact that the winter was long and severe, the hatching being a month later. At present time they are from 2 to 2½ inches in length.

I might also suggest that on account of bad roads the distribution of fish should be no later than the last of September or 1st of October, they will be then 3 to 3½ inches long.

The whole respectfully submitted,

I have the honour to be yours very truly,

W. G. BELKNAP,

*Officer in Charge.***15. TADOUSAC HATCHERY.**

TADOUSSAC, August 20th, 1906.

Professor E. E. PRINCE,

Dominion Commissioner of Fisheries,
Ottawa.

SIR,—In accordance with your instructions, I have the honour to submit my report for the operations carried out in the Tadousac hatchery for the present year. From the crop of salmon eggs of November last, 3,500,000 deposited on the trays in the Tadousac hatchery; 250,000 salmon eggs were packed in moss and sent to the Roberval hatchery to be hatched there and planted this season in the rivers of the Lake St. John. On the first of April last some 500,000 eyed salmon eggs were also packed in moss and sent to our new Ste. Marguerite river hatchery. All precautions were taken to make a success of it. The boxes of salmon eggs have been carried on a sled fitted up with springs to prevent the least knock on the road. Those 500,000 salmon eggs hatched out well in the first days of May and were planted by myself in June in the Portage river tributary of the Ste. Marguerite salmon river. The balance of the salmon eggs

SESSIONAL PAPER No. 22

2,750,000 remaining in the Tadousac hatchery hatched out in May, and the salmon fry to the number of 2,435,000 were distributed in the following rivers and lakes :—

Murray Bay river	200,000
Little Saguenay river	100,000
St. John's river.....	100,000
Jacques-Cartier river	125,000
Ste. Marguerite river, North east B.....	200,000
Baude river	500,000
Chisholm river.....	500,000
Long lake.....	300,000
Gobeil's lake.....	300,000
Du Gouffre river by the proprietor, Wm. Kennedy.....	10,000
	<hr/>
	2,335,000
A Mars river, Ha Ha bay.....	100,000
	<hr/>
	2,435,000

As usual, we set our two salmon nets in May for the capture of parent salmon. The salmon came in much earlier than usual and in large number. On the 14th of July, we had secured seven hundred fine parent salmon and our salmon nets raised. Of that number 400 were females and 300 males now in the salmon pond and being much admired by a great number of visitors. Besides the 700 parent salmon in the pond waiting for the spawning time, 295 salmon of smaller size were liberated at the door of the salmon fisheries, and 41 damaged salmon were sent to the nuns of the Hospital 'Hotel-Dieu St-Valier,' Chicoutimi. In all probability, at the spawning time, I will collect at least 4,000,000 eggs. The new Ste. Marguerite river hatchery, situated on a fine stream of the purest water, will prove to be of great benefit for the river and the salmon fisheries in general.

The president of the Ste. Marguerite Salmon Club, Mr. William Mitchell, of New York, went up in July to see the hatchery and was very much pleased with it. The net salmon fishing has been very good. We have been favoured in it by the good easterly wind prevailing in all the fishing season. The fly fishing has also been splendid in all the salmon rivers tributaries of the Saguenay river. The guardians of the salmon rivers report them well stocked with parent salmon. Mr. J. N. Maher, employed by the Provincial Government as guardian of the Saguenay river, told me that he saw enormous quantities of salmon at Ha Ha bay at the entrance of the River à Mars, where some salmon fry from the Tadousac hatchery have been planted every season for the last twenty (20) years. As soon as our salmon nets were taken off, I set my men for the remainder of July to work at some temporary repairs to the dam of the salmon pond, which leaked so much that a small depth of water was remaining in the pond at low tide, and I was afraid for the safety of our parent salmon. On the 3rd of August I had the pleasure of the visit of the Hon. Minister of Marine and Fisheries. The sidewalk leading to the kiosk of the salmon pond, broken by the ice, has been replaced, to the great delight of the visitors. The Lakes Long and Gobeil, with great quantities of fresh water smelts, proves to be a good nursery for our young salmon. About ten days ago a gentleman fishing for trout in the Gobeil's lake caught three fine specimen of young salmon, weighing $2\frac{1}{4}$ and $2\frac{1}{2}$ pounds. The first planting of some salmon fry there had been done in 1902. Those young salmon go down to the St. Lawrence river by the Little Bergeronnes river.

I have the honour to be, sir,

Your obedient servant,

L. N. CATELLIER.

16. GASPÉ HATCHERY.

GASPÉ, September 10, 1906.

Prof. E. E. PRINCE,
Dominion Commissioner of Fisheries,
Ottawa.

SIR,—I have the honour to submit my annual report upon the work of the Gaspé hatchery during the past year.

As stated in my last report of December 9, 1905, I laid down in the troughs on November 5, about 1,250,000 eggs, and I am pleased to be able to report that I had a very small percentage of loss.

Owing to the cold late spring, the fry were late in hatching out, and I only commenced planting them in the rivers on July 3, but having a good supply of canoes we got them out quickly and in fine condition, an officer from the hatchery supervising the planting in one of the rivers every day. They were planted as follows :

River St. John (Douglastown).....	336,000
River Dartmouth	382,000
River York	382,000
	—
Making a total of.....	1,100,000

I am pleased to be able to report that both the salmon net and fly fishermen have had a most successful catch this last summer, and the guardians still on the river report great quantities of salmon now on the spawning beds ; and amongst them large numbers of grilse and small salmon.

The hatchery is cleaned up and trays, &c., put in good shape for the work for the coming season.

I have the honour to be
Your obedient servant,

R. LINDSAY,
Officer in Charge.

17. RESTIGOUCHE HATCHERY.

FLATLANDS, near CAMPBELLTON, August 22, 1906.

Professor E. E. PRINCE,
Dominion Commissioner of Fisheries,
Ottawa.

SIR,—I have the honour to transmit herewith my twenty-sixth annual report upon the operations of the Restigouche hatchery during the past year.

The Government net and W. G. McBeaths licensed net were operated for a short time during the season of 1905, for the capture of parent fish, some 175 very large fish were collected from both nets, and as these were two-thirds female, fully one million fine eggs were collected and deposited in the hatching troughs last autumn. These were further supplemented by a quota of 750,000 eggs from the Carleton pond, St. John, filling the hatchery almost to its usual capacity. Great success was accomplished in

SESSIONAL PAPER No. 22

the care and hatching of these eggs, not more than 10 per cent being lost during the period of incubation and after fry had hatched.

The work of distributing the fry in the various streams and rivers began June 20, and they were planted in fine condition as follows:—

Restigouche river between hatchery and mouth Kedgwick, towed by scow.....	900,000
Upsalquitch river, towed by scow.....	300,000
Matapedia lake, by train.....	100,000
Matapedia river “.....	200,000
Matamaga Salmon Club, Causapscaal, held over in tanks.....	25,000
Held over in hatchery in pond and tanks.....	50,000
Total.....	1,575,000

Salmon Trout.

50,000 semi-eyed eggs received from Ottawa hatchery in April. Fry distributed in Lake Matapedia.....	45,000
Grand total.....	1,620,000

The departmental net and W. G. McBeath’s licensed net were again set this season about the 1st of June, for the capture of stock fish, both nets were only kept fishing for three weeks, when they were taken up, having captured 340 fine large salmon, the greatest catch in the history of the government net; these fish will yield a very fair supply of eggs for the stocking of the hatchery this fall.

Upon further investigation, I find a great deal of uncertainty existing in connection with the establishment of a salt water pond.

Rather than disturb the present departmental net and pond, it would be better to lease out one or two more of the licensed nets, which are set immediately below the government net, and permit of those fish which are now going into the market being captured for the pond and stocking of the hatchery. Were such a scheme adopted, our net could be raised early in June, when a sufficient supply of fish was obtained, which was the case this season. This method would always guarantee a good supply of fish, at less cost than constructing a new pond.

Since the distribution of the fry, the hatching house has been dried and thoroughly cleansed, and all trays and troughs revarnished and made ready for the reception of the ova this autumn.

Trusting the foregoing report will meet with your approval,

I am, sir,

Your obedient servant,

ALEXANDER MOWAT,
Officer in Charge.

18. GRAND FALLS HATCHERY.

GRAND FALLS, N.B., August 27, 1906.

Prof. EDWARD E. PRINCE,
Dominion Commissioner of Fisheries,
Ottawa.

SIR,—I respectfully request herewith to transmit to you a statement of the work done at the St. John river fish hatchery under my charge, since the month of November 1905. About the 14th of that month I received my quota of salmon eggs from the Carle

6-7 EDWARD VII., A. 1907

ton pond, about one million six hundred thousands; they arrived at the hatchery in good order in charge of my assistant Frank J. McCluskey, and were placed on the trays immediately on arrival, and they did remarkably well all winter and hatched out a very good percentage of young in the spring, they were carefully handled and kept clean during the hatching season with a good supply of pure cool water all the winter.

On June 18 we commenced to distribute the young fry into the following named waters, with the approximate number in each place:

Ste. Croix river, in Charlotte county.....	150,000
Tobique river, in Victoria “	250,000
Salmon river “ “	245,000
St. John river “ “	500,000
Rapide des Femmes “ “	150,000
Skiff lake, York county	55,000
	1,350,000

I am very much pleased to be in a position to inform you that the distribution of the fry was well and successfully done.

All of the foregoing is respectfully submitted.

I am, sir,

Your obedient servant,

CHAS. McCLUSKEY,

Officer in Charge.

19. MIRAMICHI HATCHERY.

SOUTH ESK, N.B., August 30, 1906.

Prof. E. E. PRINCE,

Dominion Commissioner of Fisheries,

Ottawa.

SIR,—I beg to submit the following report on the operations at this hatchery during the past year.

By reference to my last annual report, December 7, 1905, it will be seen that the total number of ova collected here last autumn amounted to 2,375,000. Of this number 650,000 were shipped to the hatchery at Windsor, N.S., leaving a balance of 1,725,000 in this hatchery. This number of ova was carried through the winter months without any loss above the usual percentage, and at hatching time yielded 1,650,000 healthy fry, which were distributed in the following waters:

Northwest Miramichi.....	700,000
Little Southwest Miramichi.....	500,000
Main “ “	200,000
Sevogle river.....	175,000
Pleasant lake, King's county.....	50,000
Shediac river, Westmorland county.....	25,000
Total.....	1,650,000

It will be seen by the above statement that all the fry were deposited in the Miramichi and Sevogle rivers, with the exception of 75,000 which were applied for by the 'Pleasant Lake Fishing Club' and by 'The Shediac River Fish and Game Club.' It was considered advisable to omit all the small streams in which comparatively small quantities of fry were planted in past years, and to confine operations to the larger and more important rivers. The plan of liberating large quantities of fry in the main streams, it is believed, will prove just as beneficial, and be less costly than carrying small lots to the planting grounds on all the small streams, as has heretofore been done. There are exceptions to this plan where good results can be obtained by planting small lots from year to year. For instance, Pleasant lake in which very few fish of any kind were found a few years ago, now affords splendid angling, resulting from the planting of fry

SESSIONAL PAPER No. 22

from this hatchery, but the idea, that in order to benefit the small streams that are tributaries of a large river, that a quantity of fry must be planted in each, as has been done here in the past, is erroneous, and in my opinion these streams will be just as much benefited by planting the fry in the main river into which the smaller rivers empty. As previously stated, this plan was adopted this year, and I may add that all the fry were planted in splendid condition, under the supervision of the assistant officer.

After distribution was completed, the usual work of varnishing the hatching troughs and trays was performed, and the interior of the hatchery put in as good condition as possible.

Although the interior of the hatchery is not in as good condition as it should be, it has been decided not to expend any great amount on repairs this year, but only to have such work done as will insure the coming season's operations to be as successful as heretofore.

The necessity of improving and enlarging this hatchery is great, and I will only state here that although the hatching and distributing of over $1\frac{1}{2}$ millions of fry annually has been successfully accomplished, it has been performed under a great many disadvantages, as the building is old and dilapidated, constantly requiring slight repairs, also badly lighted, and the troughs and tanks not arranged in the manner that experience has taught will give the best results with the least danger of loss. I may also add that the importance of the salmon fishing of this river and bay would justify the erection of a hatchery with fully twice the capacity of the present one. Three millions of fry could be hatched at very little more expense than incurred for the present output. There is no difficulty in obtaining all the parent fish required only a short distance from the hatchery, and the necessary accommodations for retaining them until spawning time can be very easily arranged.

For the purpose of obtaining the required supply of parent fish this year, two stands of nets are now in operation, and although no fish have yet been placed in the retaining pond, the indications are that no difficulty will be experienced in obtaining a full supply.

In conclusion, I may say that another very successful season has been experienced by the fishermen and anglers on the rivers in this section. The catch easily surpasses any that has been made during the last twenty years. Salmon entered the river early in May and continued very plentiful until the fishing season closed. In conversation with one fisherman who operates his nets about twenty miles down river from where the hatchery is situated, he informed me that he procured over 5,000 fish from his own nets in two months. This was not an exceptional case this year, as all the fishermen from Tide Head to the mouth of the bay had catches far above the average. The anglers on all the streams made very large scores and I have been informed by many of these gentlemen that they never before saw such numbers of salmon and grilse in the headquarters of the rivers. Some of the guides say that in many comparatively small pools anywhere from 100 to 200 salmon could be seen. The same is reported from all the rivers. The guides also state that good fishing could be obtained this year on some streams where in past years only on very rare occasions a salmon could be found. Immense numbers of grilse also entered the rivers during the month of July. This will tend to show that the future supply of grown salmon is assured.

On the whole, the salmon fishery was never in better condition, and more profitable to those engaged therein than at present. This is certainly a great encouragement to continue the work of planting as large a number of fry as possible every year, in order to assist nature in keeping up the supply to meet the increasing demands that are annually made upon our fishery. Fish-breeding has become very popular with the fishermen and anglers in this locality, and they appreciate the good done them by the government in operating the hatcheries, and look forward to the time when this establishment will be so improved, that the output of fry will be greatly increased.

I am, sir,

Your obedient servant,

ISAAC SHEASGREEN,

Officer in Charge.

20. SHIPPEGAN HATCHERY.

SHIPPEGAN, August 16, 1906.

Prof. E. E. PRINCE,
 Dominion Commissioner of Fisheries,
 Ottawa.

SIR,—I have the honour to report on the operations of this hatchery during the past season. Female lobsters were not as plentiful as last year, which may be attributed to stormy weather which prevailed all through the lobster season. However, the collection of eggs amounted to nearly one hundred millions and the output of young lobsters to seventy millions. The first appearance of young lobsters occurred on the 15th June, and the last distribution was made on the 11th July, when operations ceased for the season. The interior of the building has been cleaned and put in readiness for next year's work.

I have the honour to be, sir,

Your obedient servant,

SEBASTIEN SAVOY,
Officer in Charge.

21. SHEMOGUE LOBSTER HATCHERY.

CAPE BALD, N.B., Sept. 13, 1906.

Prof. E. E. PRINCE,
 Dominion Commissioner of Fisheries,
 Ottawa.

SIR,—I have the honour to submit the fourth annual report of the Shemogue lobster hatchery, and in doing so I am pleased to say that we have been very successful.

The first spawns came in the 31st of May, and we closed on the 28th July, the hatchery being in operations 59 days, with this short season we have put out 122,000,000 of healthy young lobster fry. We delivered these on the usual ground, from Cassey Cape light, west, to Cape Tormentine, east, a distance of about 40 miles; we collected the eggs within these limits.

The lobster factory which I visited made good fishing, of hard shell lobster in June, but much more so in July when the shells got softer, they came in very plentiful, but of smaller size, and it is the general belief that the hatchery has produced 40 per cent of this year's fishing. I have looked after the hatchery business as well as possible, as my report will show.

We have laid wire fence around hatchery lot, also painted the buildings, and pipes, tanks, &c. ready for next season.

I am, sir,

Your obedient servant,

NAP. S. LEBLANC,
Officer in Charge.

22. BEDFORD SALMON HATCHERY.

BEDFORD, N.S., August 29, 1906.

Prof. E. E. PRINCE,
 Dominion Commissioner of Fisheries,
 Ottawa.

SIR,—I beg to submit my annual report on the operations of the Bedford Salmon hatchery during the past season.

In October last, I procured at Phinneys pond, Spa Spring, Annapolis county, 125,000 speckled trout eggs; and early in November obtained at the Carleton retaining pond, St. John, N.B., about 1,120,000 salmon eggs, all of which were carefully laid down in the hatching troughs here.

At the time the trout were spawned the water in the pond was very low, the fish were far from being lively, and the eggs taken from them were not all perfect, consequently about fifty per cent became sterile.

Of the 1,120,000 salmon eggs, one million fry were successfully hatched and planted in the following rivers :—

Salmon Fry.

80,000.....	Bear river....	Annapolis Co., N.S.
30,000.....	Milville river.....	“ “
200,000.....	Pennant “.....	Halifax “
200,000.....	Nine Mile river.....	“ “
200,000.....	Little Salmon river.....	“ “
190,000.....	Indian “.....	“ “
100,000.. . . .	Sackville “.....	“ “

Total. 1,000,000.

The speckled trout were planted in the following named waters :—

Speckled Trout.

5,000.....	Kidsons lake.....	Halifax Co., N.S.
5,000.....	Lochaber “.....	Antigonish “
5,000.....	Barren “.....	Colchester “
5,000.....	Folleigh “.....	“ “
5,000.....	Armstrong lake.....	Hants. “
5,000.. . . .	Fales river.....	King’s “
5,000.....	Croskills lake.....	Annapolis “
5,000.....	Mersey river.....	“ “
5,000.....	Bear river (East Branch)	“ “
3,000.....	Phinneys Pond.....	“ “
3,000.....	McGregor’s lake...	Pictou “

Total.. 51,000

Salmon Trout (from Ottawa).

10,000.....	Long lake.....	King’s Co., N.S.
10,000.....	Aylsford lake.....	“ “

The distribution of fry commenced on the 14th of May and was completed on the 14th of June.

6-7 EDWARD VII., A. 1907

During the past season large quantities of salmon, from the four lb. grilse to the 20lb. mature fish have been captured along the Nova Scotia coast, and quite a number have been taken by fly in rivers where salmon have not been caught for years, and recently stocked from this hatchery.

A number of unsolicited letters have been written me concerning the success of stocking depleted rivers, amongst them are some from Mr. F. B. Gerrard, superintendent of the Commercial Cable Co. Hazel Hill, D. Carmichael, and F. G. Burstal, electricians, all of whom are active sportsmen and take great interest in our fisheries.

These letters, which I herewith inclose, refer particularly to Cole Harbour river, Guysboro county.

Large quantities of salmon, both grilse and mature fish have been playing in the Bedford basin this season, 80 have been caught in nets, and quite a few have taken the fly in Sackville river, and anglers are well pleased with our efforts to restock this river.

The hatchery is in a good state of repair. The usual cleaning, renovating and painting is being performed. The grounds and premises are kept neat and tidy, attracting the attention of all persons who visit Bedford.

I am, sir, your obedient servant,

ALFRED OGDEN.

COOEE COFFRE, GUYSBORO Co., N. S., July 16, 1906.

ALFRED OGDEN, Esq.,
Bedford, Halifax Co., N. S.

DEAR SIR,—You will be pleased to learn the efforts made during the years 1901-2-3-& 4 to restock Cole Harbour river with salmon, the fry being obtained from your hatchery, has proved very satisfactory.

During the past three weeks, anglers report having killed a number of fish in the river, also the fishermen at Cole harbour have been taking them in their nets. They say these fish are somewhat different from the salmon usually caught there. This afternoon, I had the pleasure of landing a beauty from the upper pool in the falls.

As you are no doubt aware, this stream is an excellent breeding ground for sea trout, consequently you will appreciate what a valuable addition has been made to the fisheries of Cole harbour.

Yours respectfully

D. CARMICHAEL.

HAZEL HILL, GUYSBORO Co., Aug. 23, 1906.

ALFRED OGDEN, Esq.,
Bedford.

DEAR MR. OGDEN,—I am delighted to tell you that the benefit of stocking the Cole Harbour river with salmon fry has been very clearly demonstrated in the rod fishing results on the upper waters of the stream this season.

Quite a number of salmon have been captured of over three pounds, and many more have been seen,—aye even hooked,—needless to say the latter have invariably been of much larger dimensions than those actually landed.

The members of the Eastern Angling Club, who assisted in the distribution of the fry, are much pleased to find that the efforts to improve the salmon have been so markedly successful. We extend our hearty congratulations to you upon the result, and trust you may find it possible to continue your good work in this direction in the coming spring.

Yours very truly

F. B. GERRARD,
President, Easton Angling Club.

SESSIONAL PAPER No. 22

HAZEL HILL, Aug. 23, 1906.

ALFRED OGDEN Esq.,
 Superintendent Fish Hatchery.
 Halifax, N. S.

DEAR SIR,—It is with a great deal of pleasure that I wish to inform you of the apparent beneficial effects of the department's and your endeavours to improve the rod fishing in our rivers. Several years ago you commenced by sending us some fry for the purpose of stocking the rivers in this section of country and whilst up to the present season I personally have not caught or struck any fish that I could possibly say were the result of such stocking, still I have heard of several who have had such luck.

But this season I was successful in landing three salmon, otherwise grilse, one morning in the river above tidewater at Cole harbour, Guysboro county, weighing six pounds each, and which I am satisfied were the result of the fish sent there by the department and yourself.

I give this testimony in the interest of the stocking and preservation of our river fishing in Nova Scotia.

I think that if work in this direction were continued we should soon have our rivers equal to any on the continent of America.

Yours truly,

F. G BURSTALL.

27. WINDSOR HATCHERY.

WINDSOR, August 23, 1906.

Prof. E. E. PRINCE,
 Dominion Commissioner of Fisheries,
 Ottawa.

SIR,—In making my first annual report on the operations conducted at this hatchery during the past season, I am pleased to state that the hatching and distribution of the Atlantic salmon eggs was most successful.

The eggs were received through an officer from the hatchery on the Miramichi river who attends to the placing of the same in the hatching troughs and gave me advice as to their care.

During the season some inconvenience was experienced from sediment but no injury was caused to the eggs. The fry were distributed under the directions of Inspector Finlayson and placed in the following rivers :

Meander, Hants Co.	110,000
Avon, "	155,000
Kennetcook, "	50,000
Gaspereaux, King's Co.	60,000
Cornwallis, "	50,000
Great Village, Colchester Co.	50,000
De Bert, " "	50,000
Folley, " "	50,000
Total.	575,000

An experiment was made in the hatching of shad, but, notwithstanding the indefatigable efforts of the officers having this work on hand, the high temperature of the water supplying the jars in which the eggs were placed caused a premature hatch, the young fish being too weak to rise in the incubating jars. Respectfully submitted.

I am, sir, your obedient servant,

FRANK BURGESS.

24. MARGAREE HATCHERY.

N. E. MARGAREE, N.S., August 29, 1906.

Professor EDWARD E. PRINCE,
Dominion Commissioner of Fisheries,
Ottawa.

SIR,—In compliance with recent instructions I herewith submit the annual report of the fish-cultural operations conducted in Margaree hatchery during the season of 1905-06.

On October 26, 1905, I proceeded to Carleton retaining pond, St. John, N.B., to procure the necessary quantity of salmon ova for the season's operation. On November 8, I arrived at the hatchery with 1,072,000 fertilized ova, which were without delay removed from the transportation cases and placed in the incubation troughs. Having abundance of space, and for reasons best known to the pisciculturist, a lesser number of ova were carried on each tray than past years. We were troubled less with *fungus*. This fact and better general results is attributed in part to that. The average daily temperature of the water was higher than usual, consequently hatching commenced earlier, and were concluded about April 15. The resultant fry, vigorous and healthy, numbering 910,000, were planted during May and June in the following rivers and streams, namely:—

DISTRIBUTION OF FRY.

Stewart's brook, Margaree river, Inverness Co.	25,000
Big Intervale " "	75,000
Sugar Loaf " "	50,000
Black Rock " "	25,000
Tingley " "	50,000
Greig's " "	100,000
Hatchery " "	50,000
Hatchery brook " "	50,000
N. E. Margaree " "	100,000
Cranton's Ferry " "	50,000
Phillips' " "	50,000
Rossville " "	75,000
Cheticamp, Little river "	150,000
Middle river, Victoria Co.	30,000
Baddeck " "	30,000
	910,000

It will be noticed that fewer rivers were stocked this season. This is following the suggestion made by the Superintendent of Fish Culture, in his last annual report, where he recommends the discarding of the system of stocking indiscriminately and inaugurating the system of stocking by localities. The Margaree and Cheticamp, the leading and most important salmon rivers of Cape Breton island, mainly received the output of the hatchery. It is hoped during succeeding years to stock other streams in a similar manner. I am convinced that the very best results will follow this system of stocking.

I am pleased to be once more in a position to report the good work being done by this hatchery. At the inception of the artificial propagation of salmon here, in 1902,

SESSIONAL PAPER No. 22

and since, very strong opposition was offered to the work. We were informed that we would never see any good results. But last year the first results were visible. For twenty years salmon were never more plentiful. The majority were convinced. A few would not yield but maintained that last year's results were accidental, and would not be continuous. But the last is simply eclipsed by the present season, which is truly a 'record breaker.' Since the opening of the season it is no exaggeration to report that the Margaree pools are teeming with fish, if perchance the angler has not had success, the fault lies generally with himself. Large numbers of sportsmen have fished its pools with wonderful success, among the number several celebrities, led by William Travers Jerome, New York's District Attorney.

At present I am having the buildings renovated, the supply tank, troughs, trays, and cans varnished, and fixtures placed in readiness for a new supply of ova.

All of which is respectfully submitted.

I have the honour to be, sir,

Your obedient servant,

A. G. CARMICHAEL,

Officer in Charge.

25. BAY-VIEW LOBSTER HATCHERY.

Pictou, August 23, 1906.

Professor E. E. PRINCE,
Dominion Commissioner of Fisheries,
Ottawa.

SIR,—I beg leave to submit my report of operations at Bay-View Lobster hatchery for the season of 1906.

I commenced to get the hatchery ready for operation on April 23, one week earlier than last season.

I started the steam pump on May 7, with 7,000,000 of eggs in the jars, and with the aid of a steamer I collected ova from five canneries up to June 19.

Female berried lobsters were very scarce this year, and I was only able to fill 270 jars, or 50 jars short of the capacity of the hatchery.

This season was very cold and stormy and the fishermen missed a good many hauls during the season.

The eggs were delivered to the hatchery in good condition and hatched out very successfully.

The fry appeared first in the tanks on June 20, and hatched out very rapidly. 100,000,000 fry were distributed between Pictou island and the mainland, and around Gull Rock. 18,000,000 were also distributed between Merigomish, Arisaig and Cape George.

The frequent storms this year gave us a lot of work in caring for the eggs, by bringing in a lot of mud which could be remedied by having the supply pipe extended further out into the channel.

During the season, with authority from the department, I had the steam connections and valves renewed on the boiler. I also pointed the outside of the salt water tank, and repaired the curbing of the wells. This season being wet our wells gave us a good supply of water for the boiler.

Last September the entire covering of the wharf was renewed, it is now in good repair, and under ordinary conditions should last for many years.

The galvanized inner waste pipes will have to be renewed before we commence operations next season, but repairs to the hatchery will be very light next year.

The hatchery was closed on July 11, after the necessary cleaning and painting.

I have the honour to be, sir,

Your obedient servant,

W. F. HARRIS.

6-7 EDWARD VII., A. 1907

26. CANSO LOBSTER HATCHERY.

CANSO, N.S., August 30, 1906.

Prof. E. E. PRINCE,
 Dominion Commissioner of Fisheries,
 Ottawa, Ont.

SIR,—I beg leave to submit my second annual report of operations at the Canso hatchery for the season of 1906.

Having some preliminary work about the inside of hatchery I opened it on April 2nd so as to be ready to receive the ova as soon as fishing began.

On 19th we began operations, but owing to it being such a backward spring there was not much fishing done in April. On 30th the steamer began collecting ova and visited the factories about Tor Bay, White Head, Canso and Queensport.

We collected 95 millions of eggs and had them delivered at the hatchery in good condition.

We hatched 71 millions of healthy, young fry and distributed them around the waters of Tor Bay, White Head, Canso and Queensport.

Fishermen are taking great interest in the hatchery here since seeing its practical working results; they think it is a grand thing and very much needed to replenish the lobster fishery, which has for the last few years been falling off.

I have the honour to be, sir,

Your obedient servant,

JAMES MEAGHER,

Officer in Charge.

27. FOURCHU LOBSTER POND.

LOUISBURG, C.B., NOVA SCOTIA, September 18, 1906.

Professor E. E. PRINCE,
 Dominion Commissioner of Fisheries,
 Ottawa.

SIR,—I beg to submit my report as the officer appointed to supervise H. E. Baker's seed lobsters pound at Forchu, N.S., for the year 1906.

The first seed lobsters were deposited in the pound on the 14th May.

The lobsters taken in pound from the 14th May to the 30th June, with the exception of about 3,000, were removed and placed in the waters off the Richmond county coast the sixth and seventh days of July. The lobsters were in good condition.

Lobster fry was first seen in the pound on the 18th July, and from then to the date of the final removal fry was seen daily in and around the pound. They do not stay in the vicinity of the pound but can be seen swimming towards the ocean shortly after being hatched. On the third and fourth of August all of the lobsters were replaced in the waters off Cape Breton and Richmond counties, care being taken to replace the quantities of lobsters as nearly as possible in the waters from which they were originally taken. All of the lobsters this season were in exceptionally good order and condition when taken out of the pound.

The death rate was considerably less than in former years. In May and June it did not exceed two per cent, and in July a fraction over three per cent.

The weather during this season has been colder than usual, and the temperature of the water was considerably less than the preceding years, which accounts to some extent for the low death rate. Also, the lobsters were handled more carefully in the fishing smacks while being conveyed from the fishing grounds to the pound.

The condition of lobsters at time of removal was as follows. viz.: Eleven per cent eggs hatched, thirty-five per cent pale, light coloured eggs, advanced, the balance were in different stages of development, principally dark and green coloured, and would not hatch for some weeks. The sizes were from eight to twelve inches, principally from nine to eleven inches. We had a few fully developed lobsters with eggs seven and seven and half inches.

The catch of all kinds of lobsters on this coast has been under the average, the quantity of seed lobsters caught was considerably less than during the previous seasons.

SESSIONAL PAPER No. 22

It is too soon for the fishermen to feel the effect of the pound at Fourchu, N.S., by increased catch of lobsters, as it has not been in existence long enough for the young lobsters to grow large enough to be caught. I look for considerably larger captures on this coast in a couple of years as a result of the mother lobsters having been taken care of and allowed to develop their young in a natural way.

Everything I have written in my previous reports in connection with the pound for seed lobsters at Fourchu, N.S., I again confirm.

I am, sir, your obedient servant,
 H. C. V. LEVATTE,
Fishery Officer.

28. KELLY'S POND HATCHERY.

KELLY'S POND, P.E.I., June 2, 1906.

Prof. E. E. PRINCE,
 Dominion Commissioner of Fisheries,
 Ottawa.

SIR,—I have the honour to submit to you my report of last season's work at Kelly's Pond hatchery. On November 9, Inspector Finlayson of the Department of Marine and Fisheries placed in the hatchery 800,000 salmon eggs. For the first two months we were very much troubled with muddy water which necessitated a great amount of washing. However I am happy to say it did not injure the eggs in the least. On February 9 the eggs began to hatch; on March 24 we emptied the trays into the troughs. At least 90 per cent of the eggs were successfully hatched out and distributed in the following rivers, viz.:—

Morell	200,000
Winter river	300,000
Wheatley river	100,000
Dunk river	100,000
Mores river	20,000

In the last four mentioned rivers we did not see a single dead fish, but in Morell there were a few that were not as lively as I would like. The hatchery and the dam are in a very good state of repair, but my assistant's house and the hatchery would be very much improved by having another coat of paint.

I have the honour to be, sir,
 Your obedient servant,
 A. W. HOLROYD,
Officer in Charge.

29. BLOCK HOUSE POINT HATCHERY.

BLOCK HOUSE POINT, P.E.I., July 10, 1906.

Prof. E. E. PRINCE,
 Dominion Commissioner of Fisheries, Ottawa.

SIR,—I beg to submit my report of the work done at Block House Point hatchery for the past season. The hatchery opened for work on the 9th day of May. For the first three weeks the weather was very stormy, consequently it was impossible for the tug to make regular trips. The percentage of spawn lobster was unusually small, therefore we did not get as much spawn as last year, but I am pleased to say it hatched out splendidly. We had no dead lobsters or bad spawn in the hatchery. We distributed ninety millions of young lobsters in the following places, viz: Canoe cove, St. Peter's island, Governor's island, Governor reef, Holland cove and at the entrance of Ch Harbour. During the summer there has been a coal shed and sleeping house built for the men.

The hatchery and buildings are in good condition.

I am, sir, Your obedient servant.
 A. W. HOLROYD,
Officer in Charge.

ANNEX C.

REPORT ON OYSTER CULTURE BY THE DEPARTMENT'S EXPERT FOR
THE SEASON OF

1906.

C. G. S. 'OSTREA' SHEDIAC, N.B., October 1st, 1906.

Professor E. E. PRINCE,
Dominion Commissioner of Fisheries,
Ottawa.

SIR,—I have the honour to submit to you my report on oyster culture of this season's work to date in Prince Edward Island and New Brunswick.

On the 14th May I received instructions from your department for the *Ostrea* to patrol the coast between Cape Tormentine and Chockpish on the New Brunswick shore, to prevent lobster lines and gear being placed in those waters before the 25th May in that district; this was effectually carried out, Fishery Officer James Noonan being on board during the time we were patrolling between Cape Tormentine and Shemogue. On the 25th May returned to Charlottetown, where I coaled, watered and provisioned steamer, but owing to bad weather was unable to leave until the 1st June, when I sailed for Malpeque, P.E.I., arriving there on the 5th instant.

Malpeque.

On my arrival I was met by Fishery Officers Davison and Forbes and spent the remainder of the week with them at Grand river and Bideford river, settling disputes among the quahaug fishermen. In the following week, I commenced raking on the oyster beds in Richmond bay and continued to do so while weather permitted until the 20th July, when I considered it advisable to discontinue my work, as I had been watching the oysters and found they were nearly ready for spawning. Raking over the grounds in the spring months cleanses the beds, by removing seaweeds and eel-grass, it turns over the loose shells and disturbs the sediment, which is carried away by the tides, leaving the beds clean, as on the opening of navigation they are in a dirty state, for they have laid dormant all the winter, covered over with ice and no action of the sea to disturb the bottom until a thick sediment has settled over the whole area; this I know from actual experience. The grounds require to be worked on before the spatting season arrives which does not take place as a rule until late in July as the temperature of the water has not become sufficiently warm until the above date, and it is positively necessary for some such work to be carried on to cleanse the grounds, if one desires the spat to find a favourable resting place. Most of the work was done on a very large bed situated off Little Curtain island, but when it was too windy and rough to remain on that bed, I hauled the rakes over the whole oyster area in the bay, by going up to the head of the bay, thus taking advantage of all the areas I could.

After finishing this work I patrolled the bay with Fishery Officer Forbes on board to see that all lobster gear was taken in. This was done satisfactorily.

SESSIONAL PAPER No. 22

I then made an examination of Grand river in which Mr. D. Forbes gave me valuable assistance, when the following areas were laid off for mud digging purposes to the satisfaction of both fishermen and farmers. I have described them as follows, giving the local names and places which are known to all the residents:—

No. 1. The first one in Grand river is on lot 14 side, called the Long mussel bed lying off Thompson's cove, Lot 14, to Kingsland point. Lot 16, reserving the ell on the south side or edge for oyster fishing. This bed is approximately about thirty-five acres in extent with mud varying from 14 to 20 feet deep.

No. 2. McLean's bed on Lot 14 side, lying off John McLean's shore east of the road between the Priest's farm and John McLean's farm. This is a large bed where mud has been dug in the past.

No. 3. This is a large bed on Lot 16 side, off Alec. McNeill's shore, known as the Alec. Kenneth bed.

No. 4. Is a large bed on Lot 14 side known as the Bell or wharf bed close to the old wharf.

No. 5. Is a large mussel bed on Lot 16 side known as the McLaren Point bed lying off McLaren's point.

No. 6. This is a large bed lying just to the westward of Grand river ferry wharfs. This is a hard bed and an obstruction to navigation; and all the beds lying east of ferry wharfs, three or four in number, the lowest being about two miles below the ferry and a little to the eastward of Big Marsh shoals.

These are all large beds with deep mud, and will last for years, and the above description is sufficient as they are all locally known.

While writing on this subject I might suggest that a more systematic form of mud digging be adopted, as the areas are becoming more limited each year; by removing the mud from the area clean and even, but as it is now, a man digging for mud strikes out in the longest direction leaving lumps and hummocks all over the bed. If the area were dug out clean, this ground might afterwards be converted into another oyster growing area which would last for ages, now it is only an obstruction to navigation where the cuts fill in with soft mud. This could be followed out if the areas to be dug on were staked by the mud diggers before navigation closes, but at the present time there is an unwritten law among mud diggers, that staking of the ground is not allowed and the first man to cut ice and place his digger in position has the right to the best cut on the bed, but I have no doubt that some arrangement might be made so that the bed once dug on should be entirely removed to a sufficient depth and an even bottom. This finished my work in Richmond bay and on the 2nd August I sailed from Malpeque, arriving at

The Brae.

on the 3rd, when I examined the mud digging areas in dispute and gave the following privileges to the satisfaction of all concerned by striking a line across Brae harbour from Alexander Milligan's west line fence on the north side of Harbour bay, to the inside point of the sandhills on the north-east side of Brae island; all to the westward of this line to be granted for mud digging purposes. This is practically all the mud available in the harbour; there are one or two small patches with little depth which have been applied for, for cultivation; they are utterly worthless to dig on, and will soon be muddied over, unless a little attention is given to them. I sailed from the Brae on the 5th August, arriving in Charlottetown on the 6th inst.

Lobster Patrol.

On my arrival at Charlottetown I found instructions to proceed to Shediac at once, as the clam fishermen were encroaching on the oyster reserve. I patrolled the bay for a few days and was getting ready to rake over the bed here, when I received instructions to proceed to Cape Tormentine and patrol the coast for illegal lobster fishing. On my

6-7 EDWARD VII., A. 1907

arrival I was met by Fishery Officers Copp and Noonan, the latter accompanying the *Ostrea* each day she was out; I succeeded in destroying ten back-lines and traps in the vicinity of Cape Tormentine and Baie Verte, also eight lines and traps off Cape Bald; returning to Shediac on the 8th September, the weather being very wild and unsettled during the time I was there.

Shediac, N.B.

On the following week I commenced to rake over the beds in Shediac bay and am still doing so at the time of writing. On examining the Wilbur bed I made three hauls of the dredge with the following results: *1st haul*, 21 large 14 small, *2nd haul*, 35 large 20 small, and *3rd* 58 large and 25 small; I have not yet examined the other beds, but will do so after finishing cleaning this one.

Quahaugs or Hard Shell Clams.

While in Grand river I saw that a great deal of harm had been done to the oyster beds by the quahaug fishermen, who use the long single toothed rake for this purpose, which should be prohibited on oyster beds, as it comes up full of soft black mud. This is washed off before the clams can be picked out, this causes a thick sediment carried by the tides to settle on the oyster beds, giving the oyster spat no chance whatever of finding a resting place, and the amount of mud disturbed in this way is sufficient to choke the parent oyster. I have always maintained that it was detrimental to the oyster industry to fish clams after the close season for oysters had commenced. And as so much trouble is caused by the clam fishermen working on oyster beds during the oyster close season, I would strongly urge the department to take immediate action in placing a close season on hard shell clam fishing. It is now becoming scarce in some localities, and the sooner action is taken the better it will be for the industry, as it is a valuable one and should be preserved.

Tongs and Rakes.

For a number of years the tongs with teeth not more than three inches in length have been used with great success in Prince Edward Island and do not injure the beds, the single-toothed rake with teeth nearly a foot long break the crust of the oyster beds causing mud and sediment to find a resting place which is very detrimental to the beds. The single-handled rake and mechanical tongs or grapnels, (an American invention) hoisted to the surface of the water with a winch, should be prohibited by law from being used on our oyster beds.

Transplanting small Oysters.

During some seasons the oyster spat fall more heavily than others, and there are several shallow natural resting places where young oysters are found, the spat being carried there by the tides, can be easily picked up, especially around Curtain and Ram islands, Richmond bay. If arrangements could be made for these small oysters to be picked up in the spring of the year and transp'anted to some of the natural oyster beds lying in deeper water, it would be a great advantage to this fishery in general, as these small oysters do not mature as a rule, but are killed by the frost and ice during the second winter if not removed and placed on areas by other persons. Large quantities have been picked up from time to time by individuals and laid on private areas, but that is of no material advantage to the general public, and if some system like the above could be arranged it would certainly be an advantage to all concerned in the industry.

I have the honour to be, sir,
Your obedient servant,

ERNEST KEMP,
Oyster Expert.

SESSIONAL PAPER No. 22

EXTRACTS FROM A PAPER ON OYSTER CULTURE, READ AT THE BOARD OF TRADE ROOMS, CHARLOTTETOWN, ON 23RD MARCH, 1906, BY CAPTAIN ERNEST KEMP, DOMINION OYSTER EXPERT.

Oyster culture is a subject which covers a great deal of ground, as it is conducted in so many various ways according to the country and locality in which it is prosecuted. A general idea of these different systems will not be out of place if I briefly mention some of the methods in which it is carried on abroad before making any suggestions, as to what should be done in the maritime provinces. We all know the waters around us are admirably adapted for the cultivation of these delicious bivalves, as they are growing naturally from the Bay des Chaleurs, along the New Brunswick and Nova Scotia shores, rivers and bays, as far as the entrance of the Strait of Canso, in the waters of Cape Breton, and last but not least, all the waters of Prince Edward Island; how much more so, would be, the output of this extent of territory if all the available water space were occupied by private culturists, it is not for me to say.

I would like to convey to the mind of the culturist, certain things to be carried out and others to be avoided, in order to make his labours a success, so will first make a few remarks on

Oyster Culture in England.

I was brought up among oysters and my intimate connection with the Whitstable Oyster Company, of which I am still a member and where I gained most of my practical knowledge and experience, will enable me to bring to your notice a few facts connected with the industry.

No artificial means are used by the above company on account of the exposed situation of the beds, being nearly four miles off shore. The system of dredging with sail-boats is carried on to catch the supply for market, and clean the grounds by moving the cultch or loose shells, and removing weed, starfish, dogwhelks or borers as they are called here, or any other marine enemy of the oyster, also to transfer oysters from one bed to another; the constant dredging keeps the shells in a clean condition, and periodically shells are scattered over the beds to catch the spat. The area is about one and one-half square miles in extent and is divided into sections or beds, different grades of oysters being placed in each particular section, there is one place for marketable oysters, another for half-grown, another for the small, and so on. The fishermen are informed of the quantity and quality they are to catch, each day they go to work on the grounds. These oysters are taken to the company's warehouse where they are culled and shipped to all parts of England and the European continent, as they may be ordered; no oysters are sold on commission for what they will realize. The price is fixed by the company, and very little change is made after it is once fixed for the season.

The oysters sent to market are all of an uniform size, whether it is large or small, according to the grade or quality.

Very little, if any poaching is carried on by the outside fishermen in English waters. At one time some of the ordinary fishermen were strongly opposed to the scheme, where companies applied for concessions, but after these companies became established in many cases it was found to be of great benefit to them, as it opened up a ready market for their catch of oysters, whether young or old, and often they would find employment by hiring themselves and their boats to the oyster growers, where their time would be taken up in cleaning and cultivating the grounds, also catching oysters for market when the trade was brisk, so that the apparent loss of a small area of ground which was entirely useless to them, but where they would occasionally try to fish eventually became a source of employment to many of them with regular wages.

Should any poachers be caught in the act, they are severely dealt with at the hands of justice, either by paying heavy fines or imprisonment. To prevent raids being made by poachers on these valuable grounds a staff of watchmen are always on hand for both day and night work. Dogs are often trained on these watch boats to bark as soon as a boat or vessel comes within the limits of the grounds or is sailing by. These means all tend to keep marauders at bay. Creeps or grapnels are sometimes used; they

6-7 EDWARD VII., A. 1907

are attached to chains and spread over the areas, which would catch a dredge if it were hauled over them. Prevention is better than cure. * * * * *

In France the method is somewhat different, as the weather is so much milder and frost is not sufficiently felt to hurt their undertakings, and it is entirely artificial, tiles are used dipped in a solution of sand and lime, forming a rough coating of cement for the oyster spat to adhere to, they are then arranged in layers or in tiers laid crossways, these tiles are not flat but long and rounded, so formed that the spat might adhere to both sides of it.

After the spatting season is over they are carefully inspected, and if the spat had adhered, the tiles were sometimes placed in deeper water until the following spring, when the young oysters are stripped off, by means of a knife or chisel made for the purpose. They are then placed in trays for a short time and afterwards deposited in clairs, pits or other areas allotted for them. Of course this method is impossible in this country owing to the severity of the winters, but I thought it would be useful to know how it is done.

The clairs, which are used chiefly for fattening and greening purposes (of which the French are so fond), are diluted with a little fresh water, and are kept more stagnant than the ponds which are used for growing purposes. Parc owners affirm that the smaller the quantity of water there is in a clair, the oysters, being more exposed to action of light and heat, consequently grow with greater rapidity.

In the parc at St. Joseph's in France, which are most exposed to the inclemency of the weather, the oysters are turned, and laid on their flat sides. This ingenious arrangement renders the animal less accessible to the action of the cold, and gives the shell a firmer position, thus preventing it from being too easily lifted by the surf, and from being thrown to a distance by the violence of the sea.

Oyster Culture in the United States.

Oysters are to be found on nearly the whole length of the coast line, in some places more plentifully than others. There is such a vast area of water suitable to the natural conditions of the oyster and the demand being so great the grounds are divided into two parts; one being the public or natural bed of the State, and the other consists of areas of ground brought into cultivation by owners and companies who devote their time and spend large sums of money in order to bring these grounds into a high state of cultivation. After that is done, the first expense being the heaviest, the grounds are kept clean, and oysters are obtained for market at the same time. Oysters are considered so cheap and plentiful that they are eaten by all classes; they are also exported in large quantities to the European market and also to the Pacific coast for planting purposes.

Oyster farming in America, which presents some features of resemblance to the French system, and also many differences, has grown up as the result of private enterprise, without any help or any direct encouragement from the government.

Several years before Coste and De Bon commenced their experiments, the oystermen of East River, having observed that young oysters fastened in great numbers upon shells which were placed on the beds at spawning season, started the practice of shelling the beds in order to increase the supply; and in 1855, or three years before Coste represented to the French Emperor the importance of similar experiments, the state of New York enacted a law to secure to private farmers the fruits of their labour, and a number of persons engaged in the new industry on an extensive scale.

In portions of Long Island Sound, especially off New Haven, it has been needful to make a crust or artificial surface upon the mud before laying down the shells. This is done with sand.

The following account of the method of laying out and stocking a deep-water oyster farm in Connecticut, and the statement of the attendant expenses, is copied from Ingersoll's 'Report on the Oyster Industry of the United States':—

It is thought hardly worth trying unless at least fifty acres are obtained, and many of the oyster farmers have more than one hundred acres. These large tracts,

SESSIONAL PAPER No. 22

however, are not always in one piece, though the effort is to get as much together as possible. He obtains the position of the ground, as near as he can, by ranges on the neighbouring shores, as described in his leases, and places buoys to mark his boundaries. Then he places other buoys within, so as to divide his property up into squares, an acre or so in size. In this way he knows where he is as he proceeds in his labours. Having done this he is ready to begin his active preparations to found an oyster colony.'

Preparations.

'When a cultivator begins the preparation of a deep-water farm, his first act is to scatter over it, in the spring (about May), a quantity of full sized, healthy native oysters, which he calls 'spawners.' The amount of these that he scatters depends on his circumstances; from thirty to fifty bushels to the acre is considered a fair allowance here, I believe. The rule is, one bushel of spawners to ten bushels of cultch. He now waits until early in July (from the 5th to the 15th is considered the most favourable time), when he thinks his spawners must be ready to emit their spat. He then employs all his sloops, and hires extra vessels and men, to take down to the harbour the tons of shells he has been saving up all winter, and distribute them broadcast all over the whole tract of land he proposes to improve that year. These shells are clean, and fall right alongside the mother oysters previously deposited. The chances are fair for catching spawn. Sometimes the same plan is pursued with seed that has grown sparingly upon a piece of ground; or young oysters are scattered as spawners, and the owner waits until the next season before he shells the tract. Sometimes the ground must be cleaned before any preparation can be begun upon it, by elaborate dredging, or otherwise. Within the harbour, for instance, considerable muddy bottom has been utilized by first paving it with coarse beach sand. No spot where there is not a swift current is considered worth this trouble. The proper amount is two hundred tons of sand to the acre, which can be spread at the rate of five sharpie loads a day, at no great expense. The sand forms a crust upon the mud firm enough to keep the oyster from sinking, and it need not be renewed more than once in five years.

Expenses of an Oyster Farm.

In either case, therefore, the planters expense has not been enormous. Two statements are herewith presented of the outlay under the operations outlined above, which are as follows:—

No. 1.—Fifty acres.

2,000 bushels spawners at 30 cents.	\$ 600 00
15,000 bushels shells at 3 cents	450 00
Planting 15,000 bushels shells at 4 cents	600 00
Total.	\$ 1,650 00

No. 2.—Sixty acres.

2,000 bushels of spawners at 56½ cents.	\$ 1,130 00
17,000 bushels shells at 4 cents.	680 00
4,453 bushels Bridgeport seed at 10 cents.	445 30
Total.	\$ 2,255 30

In third case Captain George H. Townshend gave a statement of the expenses to me of starting a farm of twenty-five acres off the mouth of East Haven river. This was a more elaborate arrangement, but, on the other hand, was accomplished through a

variety of favourable conditions, cheaper than would have been possible with the ground otherwise situated.

2,000 bushels small river oysters at 25 cents.....	500 00
Spreading same and staking at 5 cents.....	100 00
600 bushels dredged seed at 40 cents.....	240 00
10,000 bushels shells, put down at 4 cents.....	400 00
Total.....	\$ 1,240 00

It would not be unfair to average the cost of securing, surveying and preparing the deep-water beds at about \$40 an acre, or about \$4,000 for one hundred acres. To this must be added about two dollars an acre for ground surveys, buoys, anchors, etc. This starts the planter in his undertaking, and if these beds are in an exposed position they are liable to suffer loss by storms, shifting sands, etc. ; if, on the otherhand, they are well protected by nature, there is the watching and attention to be given to them grounds, as the catching of the stock after it has matured, or the separating of the seed which must cost a further sum, but when once started, there are always oysters which are caught that can be marketed, so that you are killing two birds with one stone, catching the oysters and cleaning the ground.

Management of Oyster Farm.

Having secured a spat of young oysters upon the cultch which has been laid down for them, they are left alone until they attain the age of three, four or five years, according to the thrift and the trade for which they are designated, by the end of which time they have reached a large size and degree of fatness, if the season has been favourable. If, as is largely done by those planters who live at Oyster Point, the bivalves are to be sold as seed oysters to Providence river, or other planters, they are taken up when only two years old.

At any time before the end of May, the disturbance of the beds can do little harm, and the experience of the Connecticut oyster farmers shows that the thorough raking of the oyster beds, just before the spawning season, is a positive benefit. The young bivalves cannot attach themselves to dirty and slimy shells, and if all the sponges, hydroids and seaweeds could be dragged from our beds in April and May, and if the old decayed and slimy shells could be ploughed under and covered with cleaner shells from below the surface, by dredging just before the spawning season, the fertility of the beds would be greatly increased, and there is, therefore, nothing in the nature of the oyster to demand the closure of the beds in April and May.

Enough instances have been given to show that the prohibition of dredging will not save any bed which can be reached with tongs, and as the dredge is a much more scientific, effective and economical apparatus than the tongs which it has superseded, there does not seem to be any reason why its use should be prohibited. In one way the use of dredges is a positive advantage to the beds. The dead shells which are found on an unworked bed are usually so covered with sponge, slime, and other substances, that they furnish no clean surface for the attachment of spat ; and as dredging tends to turn up clean shells, to break up and scatter the clusters and to tear away the sponges and other foreign bodies, it is a positive benefit to the beds ; the teeth of the dredge take hold of the rank growth of the beds, and by being dragged through *them* loosen and give *them* room to grow and mature properly ; moreover, beds are continually increased in size, for when the vessel runs off the beds with the nets filled with oysters, the oysters and cultch are dragged off on ground where no oysters existed, and thus the beds are extended ; and when the vessel is wearing or tacking to get back on the oyster beds, the catch just taken is being culled out, the cullings thrown overboard forming new cultch for drifting spat to adhere to. Many persons who do not advocate the total prohibition of dredging, believe that the size of the dredging boats, and the size and the

SESSIONAL PAPER No. 22

weight of the dredges should be restricted by law. They give two reasons why the size of the boats should be restricted, urging that the large boats are able to work on the beds when the police boats cannot venture out, and that their size permits them to use very large dredges, and thus catch great quantities of oysters.

It is asserted that the use of large dredges causes much evil, as they ruin the beds by crushing or smothering or burying in the mud more oysters than they capture; but the private farmers of Connecticut find it to their advantage to use much heavier dredges, and their farms improve under this treatment, although very heavy dredges are hauled by steam over the beds, even in the spawning season.

The cause of the exhaustion of the beds is because the demand has outgrown the supply. There are only two possible remedies. Either we must diminish the demand by killing the packing industry, which has created it, or we must increase by artificial means the natural supply of oysters.

This industry has paid a profit of no less than 100 per cent, annually upon the capital invested in the business, while money thus invested in other states has paid an annual interest of more than 200 per cent.

One firm laid down two thousand five hundred bushels of shells. Several large growers have laid down as many as two hundred thousand bushels each. A still larger number have scattered a hundred thousand, fifty thousand, and twenty thousand each. There are about thirty steamers engaged in the business, besides a large number of sailing vessels. It does not admit of a doubt that the business of oyster growing, as carried on in the waters of the sound, is exceedingly profitable.

With regard to transplanting the oyster and its transportation, all experienced persons were of the opinion that delicacy in handling, and freedom from jars, concussions and shock of any kind, were desirable. Oysters when under hatches, have very frequently been killed by heavy thunder storms and firing of guns. Any sudden shock or concussion will prove destructive, if they are in a confined space. Oysters taken up during the summer are much more susceptible to injury from this cause than those obtained during the winter.

Oysters are transplanted at any and all seasons, but generally in the spring and the autumn.

Here is an extract taken from the New York Fishing Gazette of the 23rd of last December, which reads as follows:—

An oyster farm of 920 acres in Normini Creek pays the State of Virginia \$920 a year.

It was started three years ago, and \$10,000 has been spent in planting. The present value of the farm is estimated at \$50,000. From a ten acre farm in the Machodock, Virginia, \$2,000 worth of oysters have already been sold this year. Virginia farms are getting seed oysters from Maryland which the laws of Maryland will not permit to be cultivated in this state. Tongers in Virginia are making more money taking oysters for the planters, than they can in taking them from the natural beds.

December 30. The establishment of oyster culture in Virginia has put it ahead of Maryland as the leading oyster state. The Maryland yield has decreased from ten million, five hundred and sixty-nine thousand and twelve bushels in 1880, to five million, six hundred and eighty-five thousand five hundred and sixty one in 1901. During the same period the Virginian yield increased from six millions, eight hundred and seventy-three thousand three hundred and twenty bushels to seven millions eight hundred and eighty-five thousand four hundred and forty-seven bushels, of which about three-fifths came from the oyster farms. The comparative results as regards state revenue stand sharply out in the following table:—

1901	Maryland	\$74,974	Virginia	\$46,044
1902	“	73,359	“	51,618
1903	“	59,665	“	62,625
1904	“	39,989	“	68,028

Disbursements in 1904 amounted to \$241,202 in Virginia and \$62,028 in Maryland, a deficit of \$22,364.

Private Oyster Culture.

The maritime provinces are equally adapted for the cultivation of oysters, and there is no reason why they should not prove as successful in our waters as elsewhere. The Marine and Fisheries Department granted leases some years ago, and an interest was being taken in this branch of industry until about six years ago.

On the 31st December, 1897, forty leases were held as follows :—

Quebec	held 2 leases containing	472 acres.
New Brunswick	held 2 leases containing	74 $\frac{1}{2}$ acres.
Nova Scotia	held 12 leases containing	74 $\frac{3}{4}$ acres.
Prince Edward Island	held 17 leases containing	46 acres.
British Columbia	held 7 leases containing	142 $\frac{1}{2}$ acres.
British Columbia	Indian reservation	365 acres.
	—	—
	40	1147 $\frac{3}{4}$ acres.

So a start had been made in the right direction, and I would like to see the time when all available water area is taken up and converted into private oyster beds, as it must bring in a source of wealth, perhaps small at first, but if carried on successfully it means a large item both as regard profit and labour.

The Soil.

Oysters cannot thrive where the ground is composed of moving sand, or where mud is deposited ; consequently, since the size and number of suitable places are becoming very limited, only a very small percentage of the young oysters can find a resting place, and the remainder perish. By putting down proper cultch, immense quantities of the wandering spat (or fry) may settle on it, and thus be saved.

The conditions suitable for oyster culture vary, in different localities and with different classes of oysters, but the general requirements may be said to be a suitable soil, consisting preferably of a bed of shells superimposed on hard mud or clay, an absence of sand, and of five fingers, dogwhelks, crabs and other enemies of the oyster, a tidal flow ; and a certain admixture of fresh water, varying according as the bed is required for breeding purposes, or mainly as a fattening ground. In some cases oysters grow abundantly on rocky ground, and it is impossible to say generally, without a full knowledge of the circumstances of each case, how far any area may, or may not, become a likely oyster ground.

An area with a smooth surface laying in about four or six feet at low water, or up to twelve or fifteen feet will not hurt, the water should be sufficiently deep, so as not to allow the ice to rest on the beds, but where they are covered by ice and a current of water running between the bottom and the ice, the oysters are protected from the weather and are considered safe. The shallower the water the easier the labour, but probably they would be safer from theft in deeper water.

After an area has been prepared the next step is to stock it, and it has often been observed that the removal of oysters from one ground to another has the general effect of improving both their flavour and their size. The spring of the year, before the hot weather sets in, is the best time for planting. By placing the oysters in shallow water during the spring and summer months, they will grow much faster than if placed in deeper water, as the sun causes the water to become much warmer ; the oyster being very sensitive to the action of light and heat which promotes a rapid growth. Oysters planted in the autumn are not so likely to thrive, as, owing to the change of soil and falling temperature, the oyster is not properly climatized before winter sets in, which very often proves disastrous. Oysters grow but little during the winter months, with the exception of getting thicker, consequently, it is all risk or loss, with little or no gain, although there are exceptions in every case. Young oysters taken in the spring will

SESSIONAL PAPER No. 22

have survived the winter, the change of water and temperature becoming warmer, gives the oyster every chance to live and grow.

In obtaining the necessary quantity of oysters for planting purposes, extreme care would be taken to secure them in a fresh condition, and if time will admit of it, to overhaul these oysters and brood very carefully, and if they are found to be in clusters they should be separated as much as possible, either from other oysters, shells, stones, or anything else they may have adhered to. This separation gives the oyster a better chance to grow into its natural shape, as oysters grow better singly than when in clusters or bunches. In securing the stock the size of the oyster should be considered, for which I give the following reasons:—Small or young oysters planted on a bed are preferable, as their growth alone will result in large proportionate returns and profits. A young oyster is not so likely to die when transplanted to another bed, as when older, nor is it any advantage to transplant a full-grown oyster unless for immediate use. In the oyster trade of this country one great advantage is the rapid growth of the bivalve, when, as is the case here, they are bought and sold by measure.

As a rule, oyster brood picked from an ebb-dry ground or above low-water mark, are much hardier than those taken from deeper water; and by removing them into deep water they would be secure from the heavy frosts which prevail around our shores; and the quality of these oysters is, as a rule, very good.

Great care should be taken of the spat, as the older it is, the hardier it becomes, and if the young are saved the future may be looked forward to by reaping a good harvest. The living and the dead shells of the adult oysters furnish the best surface for the attachment of the young; and for this reason the points where oyster beds are already established are those where the young have the most favourable surroundings and the best show for life. The beds thus tend to remain permanent and of substantially the same size and shape. It is well known that shell-fish of all kinds thrive best where the supply of lime is the greatest. The dead oyster shell is soon corroded and in a few years almost entirely dissolved by the sea-water, and I think this fact is another reason why the young oysters thrive best on a natural bed.

Cultch is the name given to the debris of shells, stones, etc., which are found at the bottom of the sea, on or near oysters beds. It has been the practice from time immemorial to supplement the natural supply by throwing down deposits of this sort on oyster grounds. Oyster and cockle shells make the best material for this purpose; in default of this, stones and pebbles may be used, the great point being that cultch, whatever it is composed of, should be clean, and for this purpose the shorter the time it is laid down before the spat falls the better.

Shells may be collected from oyster saloons and deposited near the shore, exposing them to the weather, the sun and rain, frost and snow will have the desired effect on them, they will be thoroughly cleansed of all organic or other matter, and when laid on the oyster beds are excellent spat collectors, they also serve to make a firm foundation in extending an area if required by the planter. Or they may be obtained from oyster beds, when fishing for oysters and laid on shore till required for use, or when enlarging an area may be deposited there each day as they are caught according to the discretion of those who have charge of the work.

In the United States large quantities of oysters are canned each year, and the shells are saved and returned to the water at the proper season. Another source of supply is the shucking, or opening the oysters at the packing houses, sending only the meat of the oyster to market, which is a large item saved in freight and the shells are again returned to the beds to act as spat collectors.

Oysters will spat in shallow water sooner than they will in deeper water, owing to the difference of temperature at different depths.

They will breed long before they are full grown, very probably in the first year of their age; certainly in the second. Their productiveness appears to reach its maximum at five or six years, and afterwards to decline; but much further observation is needed before any certain knowledge is acquired.

6-7 EDWARD VII., A. 1907

The state of the weather, however, has a serious influence on the spawn, and on the adult oyster power of spawning. A cold, wet and windy season is very unfavourable and a decidedly cold day will kill the spat, so that it will be seen that while in the embryonic state young oysters are very delicate and susceptible to cold. If the temperature of the sea suddenly drops many degrees, they all close their shells and fall to the bottom dead, just as a frosty night will 'nip up' and cause to fall off from the branches the delicate blossoms of fruit trees. If, on the contrary, the weather continues of a warm and equable temperature both day and night, and if it be at the same time calm, the young oysters will have a chance of taking up their positions on the various substances they love best, viz: stones, gravel, empty shells, living oysters, and other clean, hard substances.

APPENDIX No. 12.

ANNUAL REPORT ON BAIT COLD STORAGE FOR 1906.

NEW GLASGOW, N.S., October 1, 1906.

Prof. E. E. PRINCE,
Dominion Commissioner of Fisheries.

SIR,—I beg leave to submit to you the seventh annual report on Bait Cold Storage for the maritime provinces.

On account of the change in the financial year this report covers only nine months time.

For the past two years the erection and completion of new freezers has gone on at a most remarkable rate. It seems no difficulty now to get the fishermen to take up the scheme.

The two large commercial freezers, the one at Canso and the other at Halifax did a good business last spring in supplying the Bankers with bait. The one at Canso had over 250 tons of squid stored ; but this enormous quantity was not nearly sufficient to supply the demand. and they had to turn away many vessels which they could not supply. Squid so far has been very scarce this year. They have been reported in many sections but it has been almost impossible to trap or jig them in any large quantities.

The two large freezers of 100 tons erected at Lunenburg and Digby have rendered quite a service to both of those localities in supplying the fishermen with bait. The one at Lunenburg supplied some Bankers there also last spring. A new one of this same type (100 tons) is now under construction at North Sydney.

We are now at work completing one at Half Island cove to replace the one that was burned last fall. A new one at New Harbour, Guysboro Co., is well under way. The one at Newport Point is just about completed also.

There are several localities where we expect to erect freezers this year, two on the Magdalen Islands, one at Carleton, Que., and one at Shippegan Island. The following is a list of the different localities, by provinces, where freezers have been erected, with the year they were built and number of bonuses paid to each.

6-7 EDWARD VII., A. 1907

BAIT FREEZERS.

PROVINCE OF NOVA SCOTIA.

Name.	Year built.	Cost of construction		Dept. share.		No. of bonus paid.	Amount.

SESSIONAL PAPER No. 22

The following reports from different freezing stations will give you a better idea than I could possibly give you, from which you can draw your own conclusions.

PRINCE EDWARD ISLAND.

Frog Pond, P.E.I.—The secretary says;—‘I beg leave to report as follows as to the fishing industry and working of the bait freezer in our cove for this year. We put in sufficient ice during the winter, along the first part of May we put in and froze some five tons of herring. Codfish struck in the latter part of May. Fish were plentiful and of large size, plenty live bait. Very little of the frozen bait was used during the season. Codfish and hake continued plentiful and fishermen did well until the latter part of July. Dogfish struck in on July 9th and were quite troublesome. I may say that fish were not quite so plentiful with us this year as they were during the season of 1905, still our fishermen did first-rate while they could keep the gear out.’

Alberton, P.E.I.—The secretary reports as follows:—‘I may say that the season as a whole has been a little better than last season. In the spring lobsters were a good catch, with plenty of herring for bait. June was a rough month and not much was done. Mackerel and cod were fairly plentiful until the first of this month, when the dogfish arrived and since then very little has been done. Our freezer was not in operation this season.

Rustico, P.E.I.—The secretary reports as follows:—‘In looking over the season up to the present time with regard to our freezer, this has been so far the most satisfactory season we have had since our freezer was built. In April and May we froze our herring which has proved to be of very great value to the fishermen. During the summer we froze quite a lot of mackerel which turned out fine. Not only has the frozen bait proved good for cod, haddock and hake, but the most satisfactory results have been obtained in using it for mackerel bait. The boats not using frozen bait to feed the mackerel with found it nearly as well to stay at home as to go out without it. Even the dissatisfied parties have frankly admitted that the freezer has proved a great benefit as well as a blessing to the fishermen here. Very little would have been done here during the past four weeks but for the freezer. We have had very rough weather of late, it seems to me if we have one week of good weather it will finish our bait as there is such a demand for it. There is no kind of fishing that pays like mackerel fishing, that is providing we can get the fish, the prices are usually good and the fish is shipped to the Boston market. I cannot give you an account of the number of barrels of mackerel landed at present. Thanking you for your kindness and interest in our behalf during the past and also to acknowledge our indebtedness to the government in helping us build and run the freezer.’

Souris, P. E. I.—The secretary reports as follows:—‘Replying to yours of the 13th inst., I may say that in our locality the cod fishing was good. Hake was fair up to the present time. Dogfish have appeared on our coast, consequently the past two weeks we were not catching any fish. Mackerel have been very scarce. Herring fishing the past spring was a total failure, impossible to procure a supply for bait freezer. The few barrels we put up came out in excellent condition.’

Miminegash, P.E.I.—The secretary reports as follows:—‘On opening of spring we had difficulty in procuring salt and were only able to put 26 brls. of herring in the freezer, but mackerel struck in well in nets and in hooks during the early part of July and August and we froze over twenty ton of them both for bait and export. All the bait frozen by us was used up by the fishermen this season for bait as well as a considerable quantity of mackerel.’

NOVA SCOTIA.

Arisaig, N. S.—The secretary reports as follows:—‘The lobster catch was below the average, aggregating to about \$2,200 paid to the fishermen. There was but one boat fishing salmon, and the catch was about \$300. The codfish and hake industry together with the lobster fishing constitute the principal source of revenue, the latter amounted to about \$2,500. There was a considerable amount of mackerel and

6-7 EDWARD VII., A. 1907

herring caught, which were used principally for bait, both for lobster and trawling which cannot well be figured as sources of revenue. I might perhaps give a summary of fish caught as follows:—

Lobsters.....	128,000 lb.
Salmon.....	4,000 "
Codfish and hake.....	520 qtls.

I may say, in conclusion, that although the lobsters were below the average there were considerably more codfish and hake landed on account of having always a good supply of frozen bait from the freezer, notwithstanding the fact that the fish appeared much scarcer on the fishing grounds than in former years.'

Ballantyne's Cove, N.S.—'As requested, I give below an approximate summary of the quantity of fish landed in the vicinity of Cape George which includes that portion of it which is influenced by the cold storage facilities at Ballantyne's cove. This would embrace Ballantyne's cove, south side Cape George and around the point of the cape to Livingstone's cove.

	Year 1905.	Year 1906.
Total quantity of green cod in lbs.....	56,500	133,266
" " " hake ".....	65,700	131,544
" " herring in brls.....	170	100

From this statement it will be seen that the amount of cod and hake for this year more than doubled that of last year, nor does this include the amount, quite considerable, that was taken in that vicinity by foreign boats. There was a falling off in the amount of herring taken, and as this, with some insignificant catches of mackerel is the staple bait, it will be clearly evident that the cold storage of bait ought to be maintained and utilized. There is no doubt whatever but that the bait stored in the freezer at Ballantyne's cove was a very important factor in the realization of an increased catch of fish this year. This is very evident when we compare the fish industry of Cape George with bait freezer, with that of the neighbouring districts of Lakevale and Morristown without this convenience, for at these latter places, outside of lobsters and salmon very little of any other fish was caught. Indeed it may be safely said that the presence of a freezer in a district greatly influences the catch of lobsters also for it is the means by which lobster fishermen are provided with sufficient fresh bait. Hence we find that while the lobster factory at Morristown was considerably below its average packing, that of Ballantyne's cove was considerably better, some 125 more cases being packed than last year. I have not at hand the comparative figures for salmon, but I believe the quantity caught this year is in advance of last years.'

Port Hood Island, N.S.—The secretary reports as follows:—'The past season was not a prosperous one. In May we had a few spring herring but not as many as usual. We put up quite a few in the freezer and used them later on. Codfish were very scarce. In August the dogfish struck in and spoiled the fishing altogether. There were a few herring the first part of September, about 200 brls. were taken. The dogfish put a stop to all kinds of fishing. We do not expect any more fishing until December.'

Cheticamp Chapel, N.S.—The secretary reports as follows:—'The month of May was calm, very few herring were caught. June was stormy, the lobster traps were destroyed and fish were scarce. July was stormy. No fish except dogfish. August and September were also stormy. No bait but plenty of dogfish. There may have been a few mackerel but owing to the storms nothing was done.'

North Bay, Ingonish.—The secretary reports as follows:—'We have been obliged to meet discouragements during the past year, but in spite of them we have demonstrated the right of the bait freezer to exist and its helpfulness to deep sea fishermen. We filled the freezer to its utmost capacity with sea water ice, packing away 250 tons

SESSIONAL PAPER No. 22

at least. Despite the unusual heat of the summer we have no reason to feel that there has been greater waste from melting than could have been fairly predicted granting the conditions. We have demonstrated again that sea water ice is fit for the purpose of the freezer. At the time of the coming of the herring, May 20, 1906, we had not a single crate of frozen herring left in the freezer. We had thus carried our fishermen through the autumn and winter of 1905, and the spring fishing of 1906 helping them out whenever there was no fresh bait obtainable. The herring came in small numbers and remained but a short time and after their departure did not return again. Here was a great disappointment for we had hoped we might fill up the freezer with fresh herring for the June fishing.

	Lb.
We froze herring (May 20th to 11th)	4,500
In June we froze mackerel.....	15,284
In June we froze salmon.....	250
	20,034
Total.....	

We expect at least ten to twelve tons of herring besides mackerel. We think it fair to put the decrease in fish this year and the consequent decrease of earnings at one-third as against last year. We are hopeful for the future and when we get a fair chance believe we can demonstrate a moderate financial success, as well as a real advantage to the fishermen. That time has not yet come. We have demonstrated again that sea water ice is good for our purposes. That fresh fish, frozen fresh, with care and attention makes first-rate bait. That our freezing plant works admirably. That we have helped out a bad year and did our fair share towards preventing hard times this winter.,

North Sydney, N.S.—The secretary reports as follows:—‘I might say that fishing for the past season has been almost a complete failure. For some reason the herring, which we could always depend upon, failed to put in an appearance last spring, hence there was no bait to start with. The squid struck in fairly plentiful for a few days in August, and we put out our trap and did fairly well for a day or two until the dogfish struck in and if we had not taken it up at once they would have devoured it. Whenever a squid would mesh in trap, the dogfish would eat a hole around it. Now the squid have practically disappeared and I suppose the dogfish have driven them off shore or have made them so wild that they won't jig. The pollock are becoming almost as great a scourge on the bait as dogfish. They arrive about June 1 in immense shoals and drive the herring off in deep water and also drive the mackerel out of traps. They will not take bait and will seldom trap. I think if the government would permit the use of purse seines of 5-inch mesh that it would be profitable to purse seine dogfish and pollock and such a seine would not destroy any other fish.’

St. Peters, N.S.—The secretary reports as follows:—‘Fishing has been very good in this bay this season, principally mackerel and herring. The dogfish were very troublesome in August. Very few nets could be set. We froze a great many mackerel and salmon, and found the freezer very useful as we were able to buy all the fresh fish offered from the fishermen, and what we could not get ready for market that day, the freezer held in good condition till the next day. We have plenty ice on hand to freeze squid for fall fishing as soon as it strikes in. There are several going into the fish business this fall from this bay.’

Half Island Cove, N.S.—The secretary reports as follows:—‘Fish were fair the first part of the season, but of late not much was done on account of bait being scarce, and no frozen bait. Have not been bothered with any dogfish. Some striking in now for the first.’

Canso Cold Storage Co., Canso, N.S.—The secretary reports as follows:—‘This has been one of the dullest seasons ever experienced in the fish trade of Canso. The catch

6-7 EDWARD VII., A. 1907

of fish of all kinds has been about the smallest known and there has been a consequent depression in all lines of business. Bait has been unusually scarce. The catch of herring having been small and squid having been almost a total failure up to this time.

We do not think that the depression is anything but a temporary one and no doubt another season may show a very marked difference. It may be that the late fall and early winter will show much better results.

Whitehead, N.S.—The secretary reports as follows :—‘The freezer has not been in operation this summer. Bait was fairly plentiful, but dogfish very troublesome July and part of August. Codfish have been very scarce most of the season, the catch considerably short of last year. There was a very good catch of herring, the best for a number of years, and are yet plentiful, but the dogfish are now appearing and people have had to take in their nets. A fair catch of spring mackerel.’

New Harbour, N.S.—The secretary reports as follows :—‘The catch of cod, pollock and hake was fair. The herring catch has been good and is greater than that of last year. They are still on the grounds.’

Drum Head, N.S.—The secretary reports as follows :—‘It is quite hard to make out an annual report, as I expect the best of the season is yet to come; however, I may say the fishermen here did exceedingly well, landed large quantities of fish. I am sure we come up to last year, and probably better. Fishermen here have used some frozen bait. We have our freezer in good condition. Frozen herring bait on hand now. Fresh bait more plentiful than last year. I am glad to say the people highly appreciate the grand opportunity they have of preserving bait. We cannot speak too highly of this privilege. It is the means of building up the place.’

Port Bickerton, N.S.—The secretary reports as follows :—‘It is hard to give a report of the catch of fish for the season as there are nearly two months yet to finish, but the following is as near as I can give at the present time :—

Herring.	250 brls.
Mackerel	20 "
Codfish	150 quintals.

In reference to a report of the freezer it was not used. Herring were quite plentiful, but no mackerel and few cod. Dogfish were bothersome.

Quoddy, N.S.—The secretary reports as follows :—‘Reviewing the past season with regard to our freezer, I have to say this will be the most unsatisfactory one since built, owing to the scarcity of ice and bait. Codfish have been scarce all season to date. Some good catches of mackerel were taken. A good run of herring struck in here in August, the first run since 1899, and fishermen made good hauls. Our freezer did not freeze anything this year but expect to operate it another year and give the fishermen the benefit of the products. Our ice house is to be enlarged this fall and we expect to be able to handle a large quantity of frozen bait next season.’

Halifax Cold Storage Co.—The secretary reports as follows :—‘On the 30th day of April last we forwarded the Department at Ottawa, data complete at that time, and we have no sales since to report. The stock of frozen herring on hand is 50 tons greater than when data was furnished; the additional fifty tons having been frozen within the past month. We are continuing to freeze and expect by the time the season for using frozen bait is here, that we will have enough to supply the demand. Since furnishing data, we have not had any applications for frozen bait, there being obtainable a sufficient supply of fresh herring. The season for frozen herring bait opens about the first of November or before if fresh bait supply falls off’.

Sambro, N.S.—The secretary reports as follows :—‘The association did not do any business with the freezer last year. They did not put in any ice, nor freeze any bait. Mr. E. M. Bouthillier, of Halifax, froze about three ton of herring and stored about five tons that were already frozen, this was all the use to which the freezer was put’;

SESSIONAL PAPER No. 22

Lockeport, N.S.—The secretary reports as follows :—‘ The fishing here has been much better than last year. 20,000 quintals of cod, pollock and haddock, 1,000 brls. of mackerel and 3,000 brls. of herring. The herring have been plentiful till now, when they disappeared.’

La Have N.S.—The secretary reports as follows :—‘ *Re* the fishing industry for the present season to date, I may say that it has been a banner year so far as net fishing is concerned and normal for cod, hake and haddock. Fishing operations began in April, frozen bait being procured from our freezer, a little later fresh bait was easy to get. The catch of cod hake and haddock does not equal that of last year, but it is hardly fair to compare the two as most of the fishermen took to net fishing and dropped line fishing in July. The catch of mackerel and herring is certainly an unheard-of occurrence in this locality, mackerel especially. *Re* freezer, the same was filled with 90,000 frozen herring in February and cleaned out in April. We were only able to secure about 100 tons ice, hence could not keep bait any great length of time.’

Lunenburg, N.S.—The secretary reports as follows :—‘ The fishing for the season of 1906 has not been a success: the Bank catch especially being below the average, and less than last year, but as some of the vessels are still on the Banks, it is hard to estimate correctly what the shortage will be. The shore catch is also low. This is to a large extent due to the dogfish which were on our shores in large numbers until about August 1st and interfered seriously with the shore fishing. Since the removal of the frozen herring which were principally used to supply the Bank fishermen with bait, our freezer has not been operated until this week, when we started to freeze and place in cold storage some herring now being caught on our shore.’

Clarke's Harbour, N.S.—The secretary reports as follows :—‘ I will give you as near as possible a report of the fisheries to date : 1,950,000 lb. mixed fish, 50,000 lb. halibut, 2,000 brls. herring, 2,500 brls. mackerel.’

Gabarus, N.S.—The secretary reports as follows :—‘ Codfishing at Gabarus has been good this season. Mackerel was also good, but herring not very plentiful. The lobster fishery of our district, indeed of the whole of Cape Breton, was very poor, owing to the unfavourable weather. Only twenty-nine days fishing during the entire season, and as a result of the bad weather the catch is 40 per cent short of the usual quantity. Dogfish not so troublesome as in 1905. About twenty-six tons of herring were put in the cold storage in May and used by the lobster fishermen for bait.’

Bayfield, N.S.—The secretary reports as follows :—‘ Owing to the scarcity of herring this spring we did not freeze any bait, but we found the freezer a great benefit in handling our salmon and mackerel. We shipped more salmon this year than ever before. Had a good run of mackerel for a short time, but they did not last long. Cod and hake were scarce owing to the scarcity of bait, but taking the season as a whole our fishing operations were fairly satisfactory.’

Eastern Harbour, N.S.—The secretary reports as follow :—‘ Herring struck upon the shore in great abundance about the 20th of April, and although the strike was of short duration, the netters were able to secure from 150 to 400 a day. A goodly portion of this herring was stored in the refrigerator to be used again as bait for lobsters. I may also mention that the greater part of the Magdalen Island herring which was secured in the early spring by two small schooners from this port, also found its way to the freezer to be used for bait purposes. This frozen herring came in very handy to the fishermen and was to them at all times available and in good condition.’

QUEBEC.

Bonaventure River, Que.—The secretary reports as follows :—‘ We have ice enough to keep the freezer in operation all fall, and we expect to catch herring this fall to freeze for bait. We could not catch the first herring last spring on account of the ice in this cove, and when the herring came the second time, it was to spawn, conse-

6-7 EDWARD VII.. A. 1907

quently no good for bait, so our fishermen say, and that is the reason we did not put many herring in the freezer last spring, but we intend to put in all we can in the fall.'

Caplin, Que.—The secretary reports as follows:—'The herring struck in here on the 9th of May last all over this bay, and were very plentiful. On the 11th of the same month the government sent the fish-curing expert, Mr. Cowie, to instruct the people in the method of curing herring. We had a large meeting and our fishermen are preparing now to go into the herring industry another year. Our people should be truly thankful to the government for their kind consideration in trying to help them in the fishing industry. Codfish first appeared on the 20th of June, but were not very plentiful until the middle of August. The weather was generally fair for fishing except a couple of days of strong westerly winds. The bait consisted of fresh herring and were quite plentiful most of the time till about the 15th of August. During September, dogfish made their appearance and drove the other fish away. At present only a few boats are trying for fish. We did not get up any ice last winter on account of the mild weather. Had we filled the freezer, we would have had to draw the ice some seven miles. We intend putting in a dam in our small brook and have ice near at hand so that our freezer will render the same satisfaction as it did at first.'

Bonaventure East, Que.—The secretary reports as follows:—'Herring were very plentiful during the month of May. A reasonable catch of caplin for the month of June, in July, August and September no bait except frozen bait. Cod fishing for June and July fair. The catch this year at our place will not exceed over 1,000 quintals of dry fish unless the balance of the season turns out better than we expect. The amount of money made this year will be small. We froze about 15 tons of bait last spring and expect to freeze a good deal more this fall. There were no dogfish up to the present date. No haddock or ling.'

Paspébiac, Que.—The secretary reports as follows:—'During the current season fish of all kinds have been a little more abundant than last year, and the weather has been ideal for curing. The presence of dogfish for the past month have retarded operations. This pest has now disappeared. Freezer has been operated, but bait was not used when the fresh article could be obtained.'

Gascons, Que.—The secretary reports as follows:—'The last week of May and in the months of June and July the cod fishing has been very good here, and bait was abundant, but we were troubled with dogfish. In the month of August there were no fish owing to the want of bait, but there were plenty of dogfish. Since the first of September there were very few fish but the bait continues scarce. Dogfish still plentiful. In quantity the fish caught have been about three times more than last year for the fish. There have been hardly any lobsters. Salmon have been one-third more than last year. There are no other kinds of fish here. We have tried our new freezer and have frozen over twenty-three tons. Of this quantity sixteen tons have been used, and the fishermen found this bait very good.'

Newport Point, Que.—The secretary reports as follows:—'In compliance with your request, I beg to say that our freezer is nearing completion and will be ready to receive bait in the spring. The high price of lumber this season with several local inconveniences will considerably increase its cost. We are well satisfied with the work. Frozen bait would have been of very little use this season as herring for bait have always been obtainable all through the season, at least up to the present. Bait has been more plentiful this season than it has been for the past ten years.'

Cabin Cove, Magdalen Islands.—The secretary reports as follows:—'Herring were very plentiful in the month of May, but the weather was very bad. The codfishing was fairly well in the latter part of May and June, but the month of July and that of August the weather was fine, but the codfish were scarce and dogfish were very plentiful. The fishermen did fairly well with mackerel fishing in the months of July and August. There are some codfish now, but the weather is very rough. Our bait freezer was filled with herring in the spring in the month of May and we have about

SESSIONAL PAPER No. 22

one half yet on account of plenty bait in May and June. The bait is in good condition and fishermen find it very good.

Etang du Nord, Magdalen Islands.—The secretary reports as follows:—‘Our association was organized on September 21, 1905, and our building, a thirty-ton freezer, was completed December 15. We filled the ice house with ice in January, 1906, and in May of this year we froze thirty-two thousand pounds of herring for codfish bait. Codfish being very scarce, we have only used about one-third of our bait, but we expect to use the most of it for fall fishing when other bait is scarce. The frozen bait works well and the herring that were put in fresh comes out now just as fresh and firm as when put in. Unfortunately a few of the shareholders took a few soft herrings out of nets to the freezer and it did not freeze as good as the herring we had taken from the seines.’

NEW BRUNSWICK.

Shediac, N.B.—The secretary reports as follows:—‘During the spring we had considerable quantity of spring herring secured and placed in our freezer, but owing to the great demand for pickled herring and the good prices obtainable, we decided it would be better and to our advantage to dispose of the fish, so had the same pickled in barrels (90 brls. in all) and sold them for a good figure. Since then we have made no use of the freezer, however, as usual we expect it to come in good play next month and the following three months in the smelt business. I may say it is our intention to do something next spring and summer in the general fish business and hope to have a steamer running up the north shore of the province as well as to the island (P. E. I.) procuring fish for the freezer.’

As a brief summary of the season’s operations I would beg leave to say that west of Halifax the fisheries have been fairly good, in some sections better than usual. East of Halifax the season generally has been a poor one. The bait freezers have proved to the fishermen beyond a doubt that they are a real necessity and when properly run and managed, they have helped to increase the hardy fishermen’s income considerably.

The whole most respectfully submitted.

I have the honour to be, sir,

Your obedient servant,

PETER MACFARLANE

APPENDIX No. 13.

EXPENDITURE AND REVENUE

The total expenditure for all Fisheries services, except Civil Government, for the fiscal year ending June 30, 1906, including Fishing Bounty, amounted to \$968,626 being within the appropriation by \$23,182.

The total net fisheries revenue, during the same period, from rents, license fees, fines and sales, including the *modus vivendi* licenses to United States vessels, amounted to \$98,009.

EXCELLENT MAJESTY

1907

PREFATORY NOTE.

BY THE DIRECTOR.

Since the issue of the last series of scientific papers from the Marine Biological Station of Canada, (under the title 'Contributions to Canadian Biology, 1901') researches of a varied and important nature have been continued by the staff of scientific investigators who, from season to season, have worked at the station. It is pleasing for me to be able to report that many of the ablest Canadian biologists, as well as University assistants, demonstrators, and students qualified to conduct original researches, have taken advantage of the facilities provided by the Dominion government; and the investigations, begun in 1899 at St. Andrews, New Brunswick, have been continued at Canso, N.S. (1901-1902), Malpeque, P.E.I. (1903-1904), and Gaspé, P.Q. (1905). The stay in each locality has been limited to two years, and biennially the station has been towed upon its scow to a new site, thus permitting of the fisheries in an extensive series of areas coming, in succession, under the purview of the scientific staff. Indeed, during the comparatively short career of the institution up to the present date, all the maritime provinces have been visited, and vital fishery questions in each have been looked into, and important facts ascertained. In each locality where the station has been placed the fish and fisheries characteristic of the district adjacent, have occupied the attention of the staff, but faunistic, botanical, chemical and other studies have been carried on assiduously. A thorough understanding of the conditions essential to the prosperity of any fishing industry is only possible when the various biological and physical features of the coast and the waters concerned have been ascertained. The study of the 'environment' of fish and fisheries is as necessary as the study of the fish themselves and their habits, or of the practical methods of exploiting fishery resources. Hence the completion of exhaustive reports upon fisheries in all their aspects, practical, commercial and scientific, is possibly only after continued work for many years. Hasty publication often implies immature results, and doubtful conclusions and recommendations.

A glance at the table of contents will show that the thirteen reports, now presented as 'Further Contributions,' deal with practical and technical matters bearing upon the fisheries, and the important and complex problems which they involve.

The 'Plankton' investigations of which Professor R. Ramsay Wright furnishes the first instalment, indicate the kind and abundance of food, in the area examined, upon which the schools of young food-fishes subsist. In the absence or scarcity of such food these young fish would perish, and it would, of course, be vain to expect a plenitude of adult fish in future years. The abundance of marketable fish depends upon the abundance of young fry hatched out in the 'nurseries' or breeding areas in the sea, and the young fish can only be plentiful when the minute floating food or 'Plankton' is locally rich, varied, and plenteous. It would be superfluous to dwell upon the great value of such researches as those carried on for some years by Professor A. P. Knight

6-7 EDWARD VII., A. 1907

(Queen's University). The effects of dynamite, illegally used in fishing operations, and the actual and unquestionable results of sawdust pollution in waters frequented by fish, have been investigated with thoroughness and rigid accuracy, for the first time in Canada, under the auspices of the Marine Biological Station. Intense public interest has been aroused by the publication of the preliminary accounts of Professor Knight's prolonged and laborious investigations, and the final reports are included in the present series.

Dr. Joseph Stafford, who for some years has devotedly performed the duties of curator at the station, and year after year, has spent the whole season from the opening to the close, in faunistic, fishery and other studies, especially the study of fish-parasites, contributes further interesting papers, and it is important to note how many of the universities of the Dominion have sent workers to the Marine Biological Station. Toronto and McGill Universities have been prominently represented. Queen's University, Kingston, has almost every season sent some representative of its academic staff, while Dalhousie (Halifax), Mount Allison (Sackville, N.B.), Acadia (Wolfville, N.S.), and other universities, including some United States' institutions have sent workers. The station has been hampered in various ways, by the limited nature of its reference library, but especially by the lack of a suitable fishing launch fitted for investigating deep-sea grounds. These wants are happily being gradually supplied, the library already embraces a valuable and representative series of memoirs and reference works, and with due encouragement the Marine Biological Station of Canada will ere long rank as one of the best and most valuable fishery research institutions on this continent.

EDWARD E. PRINCE,
Dominion Commissioner of Fisheries.

I

THE PLANKTON OF EASTERN NOVA SCOTIA WATERS.

AN ACCOUNT OF FLOATING ORGANISMS UPON WHICH YOUNG FOOD-FISHES MAINLY SUBSIST.

By R. RAMSAY WRIGHT, M.A., LL.D., &c.,

Professor of Biology and Vice-President University of Toronto.

(WITH SEVEN PLATES.)

INTRODUCTION.

Within recent years much attention has been given to the floating microscopic organisms which abound in all great bodies of water—fresh and salt. It had not been sufficiently realized until it was insisted upon by Haeckel, Hensen, Brandt and others, that our attention has hitherto been arrested chiefly by the animal life of the sea and the great lakes to the neglect of the vegetable food-supply which necessarily forms the *conditio sine qua non* for the existence of all animal life. On land the vegetable kingdom everywhere seems to be predominant, and to account amply for all the animal life which feeds on it directly or indirectly. But in the ocean, the obvious plants—the seaweeds, brown, green and red—form a mere inconspicuous fringe of vegetation along the shore, and do not extend out beyond a few fathoms in depth. Such a fringe of vegetation can practically be neglected as the basic food-supply of the animal life of the ocean, and the question comes to be, ‘Whence do marine animals derive their fundamental supply of nourishment?’ Living creatures are either builders or destroyers of protoplasm, or in familiar parlance, either plants or animals, and the former are necessary to sustain the life of the latter. In what form then do these necessary protoplasm builders exist in the sea and other great bodies of water?

The answer is, in the form of microscopic plants, often quite invisible to the naked eye and yet present in such enormous numbers, not only at the surface but through the whole of the superficial layers of waters, some sixty fathoms deep (as far as the sunlight reaches, on the presence of which their power to build protoplasm depends) that it has been calculated that an acre of sea-water—surface measurement—furnishes as much nutritive vegetable matter as does an acre of rich meadow land in the course of a year.

No one sailing over the Atlantic suspects the presence of such a rich vegetation, and indeed it can only be disclosed by filtering the water through an exceedingly fine fabric—the finest silk gauze used by millers is that generally employed for the purpose—and this is usually done by towing a net of such a fabric behind a boat so as to insure a definite amount of water passing through it.

Investigations made in this way may be either qualitative—merely to determine the nature and relative numbers of the organisms so captured—or quantitative—to determine the absolute amount of the different kinds of organisms in a column of water of given dimensions.

It is such quantitative investigations which have rendered the statements as to the richness of the marine vegetation possible, which are made in the foregoing paragraph.

The tiny organisms obtained in this way are not all plants, many of them are animals, feeding on the former, and themselves serving as food for larger creatures.

Many of our important food-fishes, such as those of the herring and mackerel families, are known as plankton feeders, for their gill-arches are provided with a sifting apparatus which enables them to sift out from the water which they are breathing, the minute organisms it contains, and the young stages of all fish pass through a phase when they are dependent on the same kind of nourishment. Without a glance at the catch of a tow-net it seems incredible that fish of any size should be dependent on such inconspicuous food, but sometimes at the height of the summer a careful inspection of the water itself betrays its richness in life. In our inland lakes, e.g., the 'blossoming' or 'flowering' of the lake in August, when the water is full of minute green points, is a phenomenon which often attracts attention and is only a temporary exaggeration of a permanent condition. The astounding rate at which these minute creatures reproduce themselves, is one of the noteworthy facts about them.

Although there are various methods of reproduction, one of the commonest is that of division into two after they have grown to their typical size. Maupas has calculated that if a little Infusorian, not as big as the head of a pin, continued to reproduce at its ordinary rate of division—five times a day—it would, at the end of a month, form a mass of protoplasm a million times as big as the sun! It is obvious that the rate of consumption of such creatures by larger forms must be very high to keep down the population to the normal relations in which we find them, and of course the rate of reproduction of the minute plants is dependent on the amount of the carbon, nitrogen, and other elements of their food available in the sea water.

But it must be remembered that these minute plants are constantly being devoured by animals, some little bigger than themselves, others much larger; hence no one species ever gets the opportunity of monopolizing the ocean.

Another noteworthy circumstance is that our northern waters appear to be richer in plankton vegetation than those nearer the equator, richer at least, in the mere quantity of vegetable matter, not in beauty or variety of form, for the tropical species are certainly more varied, and in many cases more beautiful than the northern ones. To this wealth in microscopic organisms of our waters we owe the circumstance that we are able to supply warmer climes with the surplus of our fish production. The reason of this greater richness is not apparent; Brandt has suggested that it may be due to a deficiency of nitrogen in warmer waters owing to the more favourable conditions for the growth of denitrifying bacteria.

Before giving a detailed description of the minute life of the ocean, a few remarks as to its general character will be appropriate. The simple plants which constitute the bulk of the marine vegetation are frequently *Peridinia* (Plate I.), single cells of odd shape usually furnished with a decorated shell, and swimming actively by means of two long lash-like 'flagella.' Some of these *Peridinia* it is improper to describe as plants, for they seem to be destitute of chlorophyll and therefore obliged to depend upon preformed living matter for their food.

Another group abundantly represented in the open water is that of the *Diatoms* (Plate II.). These have always a resistant siliceous shell, and do not swim actively like the foregoing. Both of these groups of plants, however, require to live in the stratum of water penetrated by sunlight, and they do this either by their own exertions, but usually owing to the presence of organs which render floating easy, such as long delicate spines or the like, or again, to the presence of fat or oil which diminishes the specific gravity of the cells.

The chlorophyll in the *Peridinia* and *Diatoms* is often masked by other colouring matters usually of a brownish hue, but there are also unicellular plants of a pure green chlorophyll like some of those represented in Plate III., while in addition to these there occur many extremely minute forms of various colours, but in shape approaching that of the *Chrysonomad*, Fig 11, so small as to elude the meshes of the fabric generally employed. The mesh of the latter is usually $\frac{1}{200}$ of an inch on the side, but many little creatures actively swimming by means of lash-like prolongations of their

SESSIONAL PAPER No. 15a

protoplasm, the so-called '*Flagellata*,' do not exceed $\frac{1}{3000}$ of an inch in diameter, and slip through such a mesh with ease, unless accidentally arrested by the threads.

As to the one-celled animals which, of course, feed on these smaller plants, they belong to the various groups represented on Plate IV., and some of them form with *Peridinia* and *Diatoms*, a conspicuous part of the food of oysters and similar molluscs.

Again, the plankton contains many young phases of higher animals which swim about for the earlier part of their life and afterwards settle down to more or less sedentary habits. Such is the case with the sea-urchins, worms, molluscs, &c., some of the young of which are represented on Plate V. These larvæ are, of course, dependent on the minute life of the plankton for their food, and are themselves devoured by larger animals.

But there are also adult animals of small size rarely more than the $\frac{1}{8}$ of an inch or so in length, which are constantly eating up the crop of microscopic plants, and which themselves form the bulk of the food of plankton-feeding fish; such are the *Copepods* represented on Plates VI., and the *Tunicates*, on Plate VII. And, finally, reference should be made to the floating eggs of various fishes like the cod, occurring in enormous numbers, few of which ever reach maturity, but are destined to furnish nourishment to the plankton feeders.

Many of the creatures and eggs referred to are exquisitely adapted to their floating (pelagic) life, by their extreme translucency, which makes them almost invisible in the water. Such is notably the case with forms like those shown in Plate V., Fig. 13, and Plate VII., Figs. 11 to 13.

The following account of the organisms observed at Canso is intended as a preliminary one, one of the results of which it is hoped may be the lightening of the initial labours of future investigators into the Canadian plankton, and another, that some workers may thereby be induced to enter this interesting field of research, which requires, owing to the vast extent of our Dominion waters, to be sub-divided to give entirely satisfactory conclusions.

PERIDINIALES.

PROROCENTRIDÆ.

This family embraces the simplest forms of Dinoflagellata, and one of the genera at least suggests by the symmetry of its bivalve shell a relationship to the Diatoms, the colouring of which they also share. The characteristic girdling furrow of the more typical members of the order is absent.

EXUVIAELLA.—*Cienkowsky*.

This differs from *Prorocentrum* in the lack of the prominent anterior spine of that genus. The specimens observed at Canso, and more frequently at Malpeque, P.E.I., belong to the species *E. marina* (Plate I., fig. 1), but there appears to be a slight difference in that the posterior half of the shell is decorated with some short projecting spines which may entitle it to the varietal name '*hispidæ*.' The dimensions are $42 \times 33\mu$.

PROROCENTRUM.—*Ehrb*.

P. micans *E.* (Plate I., fig. 2) also more abundant at Malpeque, appears to be identical with the common European form; it is longer and slenderer than *Exuviaella* and less symmetrical in outline. The two foregoing species, especially the latter, are important constituents of the oyster's food.

GYMNODINIIDÆ.

PYROCYSTIS.—Murray.

This genus was established by Sir John Murray for certain globular cells met with in the tropical and subtropical portions of the ocean, which are frequently responsible for the phosphorescence of the sea. The species met with, *P. noctiluca* (of large size, viz. : 600—800 μ in transverse diameter) was accompanied by a spindle-shaped form *P. fusiformis* Murray, measuring $1,000 \times 160\mu$. Also at Canso a globular form of smaller dimensions ($80 \times 150\mu$) was frequent (Plate I., fig. 3), agreeing admirably in the nature of the protoplasmic contents with *P. noctiluca*. It was also accompanied by a crescentic form (Plate I., fig. 5) 180—250 μ in length by 18—25 μ greatest width which has been frequently found in the north Atlantic, and described by Schütt as *P. lunula*. The association soon turned out not to be fortuitous, for all stages of segmentation of the protoplasmic contents of the globe into 4, 8, 16, 32 balls were observed (Plate I., fig. 4), which eventually developed into crescents within the shell of the globe before they were freed by the bursting thereof. The curiously curved shapes which they acquire during their imprisonment are explained by their crowded arrangement. A further phase of development, in virtue of which six Gymnodinia (fig. 5, 5a) are formed within the crescent (one of which is distinguished from the others by a red spot), was observed such as is figured by Hensen (No. 1, Plate IV., fig. 30). Schütt figures examples with only a single Gymnodinium in the interior. It seems improbable that only one species of Gymnodinium passes through this remarkable cycle, and further studies may reveal globular and fusiform cystic stages for other species. Another cyst occurring along with the foregoing, but exceeding it in size (diameter 200—250 μ) is probably related. It was observed frequently with daughter-cells sixteen in number of characteristic form (Plate I., fig. 6) and size (50—56 μ), one alone of which possessed a rosy spot. The cells afterwards undergo encystment when, within each, eight granddaughter cells of similar but smaller size, 12 μ , are developed, one only of them retaining the original rosy spot.

In July and August there was frequently observed within dead Copepods or their appendages, a small pink Gymnodinium (Plate I., fig. 7) of subglobular form, 40 μ in its longer diameter, generally in an encysted condition, the nuclei recalling the structure figured by Schütt (No. 2, Plate XXII., fig. 73). It is probably a stage in the development of a larger form.

POUCHETIA—Schütt.

This genus has been formed by Schütt for the purpose of separating certain chlorophyllless species of Gymnodinium which are also distinguished, alone among marine forms, by the possession of more or less complicated organs of vision.

About the middle of July at Canso a form was common which possessed the yellow and brown chlorophyll of Schütt's *Gymnodinium geminatum*, disposed in strands, but in addition a well marked pigment spot with lens of the form represented in Plate I., fig. 8. As this is manifestly of the same character as the stigma of the other species of Pouchetia, that genus must be held to include also chlorophyll-bearing forms. The present species, which on account of its colour may be called *P. ochrea*, was always observed encysted, a single individual or one in various stages of division being inclosed in the cyst. The latter envelopes the body closely, and is not the thick gelatinous investment seen in *G. geminatum*. The undivided cell measures $55 \times 45\mu$ but when division is far advanced it gains a length of 100 μ . The form and position of the lens and pigment body of the stigma may be gathered from the figure. The latter shows that the two daughter individuals, instead of being in contact by similar surfaces, have their opposite poles adjoining.

SESSIONAL PAPER No. 22a

GYMNODINIUM.—*Bergh.*

A form (Plate I., fig. 9) was observed on one occasion in July, 1902, which is possibly referable to *G. gracile* Bergh. It is bright pink in colour and measures 125μ in its long diameter. In form it recalls *G. fusus* Schütt.—No. 2, Plate XXV., fig. 81.

PERIDINIIDÆ.

DINOPHYSIS.—*Ehrb.*

This genus is at once recognized by the compression from side to side and the far anterior position of the transverse furrow. Two species are common at Canso and at Malpeque; *D. norvegica* Clap. and Lach. (Plate I., fig. 10), the commonest form, measures 65μ in its long diameter, and can be distinguished by the coarse reticulation of the shell, the green chromatophores and the curved posterior point.

D. rotundata (Plate I., fig. 11), the next most frequent form, measures little more than 50μ in length, lacks chromatophores, possesses protoplasm of a very pale pink hue, often much vacuolated, and has a shell decorated with very minute round points. The anterior half of the shell projects considerably beyond the girdle, which is notably not the case in *D. norvegica*. A third species of ovate outline with green chromatophores, but smaller than either of the foregoing ($35 - 45\mu$), resembles *D. ovum*, Schütt, in form, but is not so large.

PYROPHACUS.—*Stein.*

P. horologium Stein (Plate I., fig. 12) is distinguished by the fact that its two valves are subequal and much flattened, so that it presents to the observer one or other of its poles, being then distinguished by the broad transparent flanges overhanging the transverse furrow. The chromatophores are yellowish green. It owes its specific name to the watch-glass shape of its valves. These measure 72μ in diameter. It was common in the middle of July.

PROTOCERATIUM.—*Bergh.*

P. reticulatum Clap. and Lach. is a comparatively small form which no doubt frequently eludes observation. It is marked by the coarse reticulation of the shell (Plate I., fig. 13), which is divided off into angular areas bounded by ridges and provided with a central pore, also by the deep diatom-brown of its chromatophores. It occurred at Canso in July and August, the specimens measuring 46μ in the longest diameter.

GONYAULAX.—*Stein.*

G. spinifera Clap. and Lach. resembles the foregoing in its colouring, but has a characteristic tubular prolongation of its anterior pole and carries spines on the posterior pole at the sides of the well-marked longitudinal furrow (Plate I., fig 14). The transverse furrow is markedly spiral. The long diameter is 80μ . It was observed in one gathering from Grand river, Malpeque in 1903.

PERIDINIUM.—*Ehrb.*

To this genus there belong several species which are often most abundant in the plankton, and constitute a very important element of the food of those animals which are dependent on such microscopic nourishment. Four species were recognized at Canso, not necessarily occurring at the same time, but frequently overlapping in their maximum periods. Three of these have the angular outline which is characteristic of

most of the species, while the fourth is oval in contour. The three former, however, differ in dimensions and in colour. *P. divergens* v. *reniforme* Ehrb. (according to Jorgensen, No. 3, p. 36=*P. depressum* Bailey) is the largest (120μ in transverse diameter) and has protoplasm of pinkish hue (Plate I., fig. 15, a. & b.). *P. lenticulare* Ehrb. (Plate I., fig. 16), is greenish, and measures only 80μ across, while *P. pellucidum* (fig. 17) is only half as wide, more pyriform, and quite colourless. At the beginning of August, 1902, a variety of *P. divergens* made its appearance, in which the pink colour was more intense, the reniform outline, when observed from one of the poles (fig. 15 c.) more marked, and the vertical height from pole to pole less. *P. ovatum* (Pouchet) Schütt (fig. 18) shares the pink hue of *P. divergens*, but is oval in outline except for the short tube of the apical pole. Its transverse diameter is 75μ and its vertical 55μ . The ventral fissure is bounded by two sharp teeth.

Diplosalis lenticula Bergh, was observed along with the foregoing, with which it may easily be confused on account of its oval outline, but it differs from it in possessing only five pre-equatorial plates instead of seven, and in the fact that the transverse furrow has a strictly equatorial and not slightly spiral course. Its dimensions are rather smaller.

CERATIUM.—Schrank.

This genus, like *Peridinium*, furnishes a very large part of the floating food-material of the ocean. It differs from it in having the tendency to develop flotation organs either in the form of three horns (one apical, two antapical), or by the acquisition of an exceedingly long and slender form like some of the plankton diatoms. The plates of the apical pole are fewer in number, there being only three pre-equatorial plates.

The commonest species at Canso is the widely-distributed *C. tripos* Nitsch, and the variety of this very variable species which is most abundant is *C. tripos macroceras* (*forma intermedia*) of Jorgensen. It will be seen that my sketches (fig. 19) resemble his figure (No. 3, Plate I., fig. 10) very closely. Another form in which the horns are much longer in proportion to the width of the body was commoner, earlier in the year, and is perhaps the form '*scoticum*' of Schütt, while isolated examples of a form with the antapical horns very slightly curved towards the apical pole approach the variety '*arcticum*.'

C. fusus (fig. 20) seems less variable than the foregoing. The right antapical horn is more or less suppressed, and the whole cell attains a length of over 1 mm.

GYMNASIER.—Schütt.

One or two examples of the singular little form *G. pentasterias* Ehrb. (fig. 21 a. & b.) were met with in July. The body is oval, 44μ in long diameter, and is distinguished by the presence of two intracellular skeletal plates of resistant siliceous material. After boiling with nitric acid the delicate form of these plates (No. 2, fig. 216) becomes more evident. This form is frequently regarded as one of the *Silicoflagellata* (p. 9).

DIATOMACEÆ.

Of this group a very large number of marine forms are known, some of them admirably adapted as Schütt has pointed out (*Pflanzenleben der Hochsee*) for a floating life; others on the other hand confined to a littoral life by the absence of such provisions. The adaptation for floating is generally achieved by a reduction in the amount of silica in the valves of the shell, and in addition by the flattening of the whole cell into a disc-like form or its elongation into a more or less needle-like shape. *Coscinodiscus* and *Rhizosolenia* exhibit the two extremes of these modifications, and both genera were frequently represented in the tow-nettings at Canso. Of the

SESSIONAL PAPER No. 22a

former genus some very large examples are met with; *C. concinnus* e.g. (Plate II., figs. 1 and 2) in which the sculpture of the valves is exceedingly fine. *C. oculus iridis* and *C. centralis* are smaller and have more obvious sculpture which frequently suggests artificial engine-turning (fig. 3). *Actinoptychus undulatus* Ralfs, *Actinocyclus Ralfsii* Smith and *Paralia sulcata* (Ehrb.) Cleve are not uncommon (figs. 4, 21a and b, 23).

The commonest species of Rhizosolenia was undoubtedly *R. styliformis* Brightwell, in which the adjacent ends of the valves have very characteristic fitting surfaces (Plate II., fig. 6), but *R. setigera* Bright. was also frequently represented, in which the valves terminate in long spines with a peculiar spear-blade-like enlargement towards the middle of their length (figs. 5 and 7).

Still another type of plankton diatom is that which is furnished with delicate bristles which enormously increase the amount of surface in contact with the water without materially adding to the weight. To this type belongs the genus *Chaetoceras*, which is not only rich in species but is profusely represented by individuals in the plankton.

CHAETOCERAS.—Ehren.

In the following account of this essentially planktonic genus, I shall follow the excellent paper of Gran (No. 4), which unfortunately I had not at my disposal when I made the sketches of the forms observed at Canso.

The genus is not only one of the most characteristic, but one of the most abundant of plankton diatoms. It embraces a number of species, the synonymy of which is much confused. I shall only attempt to enumerate those of the diagnosis of which I feel certain. As Gran remarks, the arrangement of the chromatophores is often of considerable diagnostic value: I have found this so in the sketches where it has been noted.

The various species of Chaetoceras generally form chains of more or fewer individuals. Each individual is a shorter or longer cylinder, more or less flattened, the shell bounding which is formed of two valves with an intermediate hoop. The faces of the valves where they come in contact with adjoining individuals are provided with two bristles or setæ, which interlock with the adjoining bristles and diverge from the surface of the chain at an angle generally characteristic for the species. The more littoral species form spores which are peculiar in shape and decoration for the various species, but no such spores were observed during the summer at Canso.

Gran recognizes two subgenera Phaeoceras, in which the brownish chromatophores penetrate into the setæ (which are frequently spinous), and Hyalochaete, in which the setæ are hyaline.

To the former group belongs *C. boreale* Bail. (figs. 9 and 10), the cross section of the cell of which is nearly cylindrical ($24 \times 22.5\mu$), and the setæ, which are over 5 mm. long and spinous, are situated in the sagittal plane. The foramina, gaps in the chain between the individual cells, are hexagonal in outline. This form was common at Canso during July and August.

Of the species belonging to the second group, I shall first refer to *C. decipiens* (Plate II., fig. 8) which attracts attention on account of its considerable width which I have measured up to 75μ . The terminal bristles of the chain are shorter and stouter, bear transverse striæ, and are directed nearly parallel to the chain. It was the commonest species observed at Canso. Less common members of the same group were *C. didymum* Ehrb., *C. lacinosum* Schütt and *C. diadema* Ehrb. The first may be recognized by the lyrate foramina caused by a protuberance on the surface of the concave valves as well as by the position of the two chromatophores which fit up against these. In the second (fig. 1), the terminal setæ are wider in the middle and decorated with interrupted spiral lines of thickening. The third species betrays itself, when seen from the valve-surface, by the circumstance that of the four setæ two are in a sagittal plane and two in opposite directions of the transverse axis.

BACTERIASTRUM.—*Schadb.*

This genus is also exquisitely adapted for its floating life. It is composed of cylindrical joints like *Chaetoceras*, but instead of each cell having only four bristles, sixteen may be observed in an end view projecting from the interval between contiguous cells and bifurcating as they radiate outwards (fig. 13). The species, *B. varians*, was observed towards the middle of September, the joints measuring $50 \times 25\mu$, the basal part of the bristles 25μ , and the forks 60μ .

SKELETONEMA.—*Grev.*

This is another similar form, which, however, appears to depend on the slenderness of its cylinders and the tenuity of its siliceous coat for its floating power. The species observed, which is also recorded from the North Sea, is *S. costatum* (fig. 14), portions of the slender cylinders being ribbed. The frustules in the specimens observed measured about 40μ in length by 4 in width.

In addition to the foregoing plankton diatoms, many other of more littoral habit were frequently taken in the tow-nets. Especially is this true of certain forms like *Nitzschia closterium* (fig. 18), or *N. longissima* (fig. 19) whose shape favours flotation, or like *Striatella* (fig. 15), whose siliceous shells are thin, and specific gravity therefore small, or like *Liemophora* (fig. 16a and b) which are frequently found attached to floating or swimming organisms like Copepoda. But there are again other forms, the shape of whose aggregations adapts them to a floating life; such are *Synedra nitschioides* (fig. 22), *Nitzschia paradoxa* (fig. 17), whose cells perform the most remarkable evolutions, *Tabellaria* (fig. 24), and *Rhabdonema* (fig. 20).

PROTOCOCOIDEE.

TROCHISIA—*Kuetzing.*

This genus includes certain unicellular forms with a thick cell-wall generally ornamented with spines or ridge-like projections.

Tr. Clevei Lemm., or a representative of this species, occurring at the same time which the spines are imbedded (Plate III., fig. 1); it was common towards the end of July. The dimensions (the cell 31μ , spines 10μ) are somewhat different from those recorded by Lemmermann (No. 5), and the ends of the spines have more than two or three points, but these differences do not appear to have more than varietal significance.

Tr. Clevei Lemm., or a representative of this species, occurring at the same time as the above, agrees on the whole in its dimensions (cell $72 - 93\mu$, spines $98 - 51\mu$), with Lemmermann's account, but the conformation of the spines is slightly different. There is no gelatinous envelope, the cell-wall is thin and the hyaline spines are often 'flaming' or divided at the end, and may vary in length and strength (Plate III., fig. 2).

Tr. dictyon (Joerg.) Lemm.—I find a single example of this species, the cell-wall of which is marked off by ledge-like ridges into quadrangular or pentangular areas, recorded in my sketches in September, 1901 (fig. 4). The cell measures 96μ in transverse diameter.

HEXASTERIAS.—*Cleve.*

Several examples of the type species of this genus *H. problematica* Cleve (Plate III., fig. 5), occurred towards the end of August, both in 1901 and 1902. It is characterized by 6 (or 7) arms projecting from a central disc about 40μ in diameter. The arms end in sharp recurved teeth. The contents become brown with chloride of zinc, but neither the arms nor the disc show a cellulose reaction. This form has hitherto

SESSIONAL PAPER No. 22a

been recorded from the North Sea, Iceland, and the neighbouring parts of the north Atlantic.

Another form was observed in August, 1902, which appears to be allied to the above, and which may provisionally be referred to the same genus. One surface of the central disc in this instance is vaulted, and each of the six projections is divided into three tapering curved spines, the middle one of each group being curved inwardly towards the flatter of the two surfaces of the disc. In the specimen observed the disc measured 68μ , the spines 40 . For convenience the species may be called *H. spinatrifida* (Plate III., fig. 6.)

I was inclined to refer to the same group an organism which was met with once in an oyster's stomach at Malpeque (Plate III., fig. 4), and which is evidently identical with Hensen's 'Sternenhaarstatoblast' (*l.c.* Taf. IV., figs. 23 and 24). I notice, however, that Hensen describes ciliation in the interior of his cysts.

HALOSPHERA—Schmitz.

This genus occurs in the form of free-swimming globular cysts, within which the contents break up into swarm-spores.

H. viridis Schmitz, first observed at the Naples Zoological Station, is a very familiar and abundant element of the plankton in June and July. The youngest cells have diffused chlorophyll with scattered starch-grains and the nucleus is not visible. Eventually the protoplasm exhibits peripheral divisions. It is segmented into numerous cells, still connected by protoplasmic bridges (Plate III., fig. 7), which soon are broken, the individual cells fashioning themselves into monadiform swarm-spores (fig. 7a). The largest cells measured were 360μ in diameter.

SILICOFLAGELLATA.

'Cells without external membranes with one or two flagella, one central nucleus and frequently many yellowish brown chromatophores, living within a shell formed of solid or hollow siliceous rods. Reproduction unknown.'

The above is the diagnosis given by Lemmermann of this singular group of which I have found for the most part only empty shells belonging to the genera *Distephanus* and *Ebria*.

DISTEPHANUS—Stöhr.

D. speculum (Ehrenb.) Haeckel is met with in a variety which appears to be that named *regularis* by Lemmermann, as the radial spines from the basal hexagon (20μ in diameter) are equal in length (15μ).

EBRIA—Borgert.

Ebria tripartita (Schum.) Lemmermann (Pl. III., fig. 9) was not uncommon in August. The genus differs from *Distephanus* in having a solid skeleton and two flagella. It has hitherto been recorded from the Baltic and the Gulf of Naples. The shells (which measure 20μ in diameter) or fragments thereof, frequently occur in the stomachs of oysters at Malpeque.

FORAMINIFERA.

Comparatively few forms were observed in the plankton, and some of these were undoubtedly young examples of bottom forms swept up by storms. Only once in September did a thoroughly planktonic form make its appearance, viz., a young *Globigerina* (*æquilateralis*?) 150μ in diameter with short delicate spines.

Examples of a *Pulvinulina* and a *Discorbina* (Pl. IV., figs. 1 and 2) were less uncommon, the former indeed very frequent in July and August, while a few examples of a *Spirillina* (fig. 3) were observed in the latter month. A re-examination of these after a study of the benthonic forms would render a closer diagnosis possible.

RADIOLARIA.

Very few members of this class were observed at Canso. Jorgensen records some sixty species off the west coast of Norway, but only three of these were found at Canso. It appears that they are commoner in the open ocean. Of those found, two belong to Hæckel's group of the *Acantharia* and one to the *Nassellaria*.

Acanthonia echinoides (Clap. and Lach.) Hæckel (Pl. IV., fig. 4) was abundant in August in both of the years spent at Canso. So abundant, that when sporulating it could be seen in the form of distinct pink dots in the plankton.

The second and much rarer Acantharian is *Acanthostaurus pallidus* (Pl. IV., fig. 5) while the Nassellarian, only observed on two or three occasions, is the *Plagiacantha arachnoides* Clap. (fig. 6). ..

INFUSORIA CILIATA.

This class is represented in the plankton chiefly by the family of the Tintinnidæ, a group exquisitely adapted for pelagic life. It belongs to the order Heterotricha, sub-order, Oligotrichidea, in which the ciliary covering is reduced to a few specialized tracts, that round the mouth being the most important. A genus, *Strombidium*, belonging to another family, Halteridæ, is, however, met with under the same circumstances, and shares the peculiar adoral series of membranelle.

Strombidium sulcatum (C. and L.) was described from salt water at Bergen, but was observed to be very frequent at Canso in August, 1901. Its outline is somewhat oval, but the posterior end is provided with certain characteristic furrows and the anterior with a projecting beak broader at its extremity than at its origin. The observed dimensions were: $440 \times 266\mu$.

TINTINNIDAE.

In discussing this interesting group of characteristic plankton Infusoria, I shall follow the account given by Jorgensen in his recent discussion of the Norwegian forms. (No. 6.)

I have reproduced in Plate IV., fig. 7, the representation of the characteristic ciliation of this group given by Lang in his Text-book (Protozoa, fig. 53).

TINTINNUS—Schrank.

This is characterized by the tubular case being open posteriorly. *T. acuminatus* Clap. and Lach. (fig. 8) was seen only on one occasion, but it is readily recognized by the ridges which occur on the posterior third of the case. The specimen observed measured $258 \times 17\mu$. *T. obliquus* Clap. et Lach. (fig. 9) was only seen in July, both in 1901 and 1902. Apart from its smaller dimensions ($80 - 100 \times 14 - 19\mu$), it may be recognized by the absence of the flaring anterior aperture.

AMPHORELLA—Daday.

This, like most of the other genera, has no posterior aperture. The commonest species of this genus, *A. subulata* (Ehrb.) Dad. (fig. 10), is exceedingly abundant in the plankton in July and August. Its case is translucent, is furnished with a long posterior spine and is at once recognizable by the series of denticulated rings which

SESSIONAL PAPER No. 22a

adorn its anterior end and seem to indicate additions to the length of the tube. It appears to constitute a considerable element of the food of the oyster in Malpeque bay.

TINTINNOPSIS—*Stein.*

This differs from the foregoing in having the case beset with foreign material. Two of the species commonly occurring at Canso were easy of diagnosis, viz.: *T. campanula* (Ehrb.) Dad. and *T. beroidea* Stein (figs. 12 and 13). The dimensions of the average examples were in the former case $150 \times 130\mu$; in the latter $43 \times 19\mu$. But in addition to these, forms similar in their general shape to *A. subulata* were very common. *T. davidow* Daday has a total length of 95μ of which 65μ belongs to the spine; it is 40μ wide. The specimen figured (Plate IV., fig. 14) exhibits lines of growth and a fine punctulation of the case, where unconcealed by the foreign material. Another variety measures 45μ in width and 240μ in total length, of which 95μ belong to the spine, which is set on obliquely to the case. No rings were observed in this variety, and the punctulation was confined to the spine (Plate IV., fig. 15). *T. cylindrica* is distinguished by the peculiar form of the aboral end of the case, which lacks the spine of the above, but has a short handle-like process of irregular outline covered with foreign matter.

T. lobiancoi (fig. 16), a cylindrical form, test-tube like in shape, ($190 \times 45\mu$) may possibly be a variant of Jorgensen's *T. subacuta*, but no annulations were observed.

CODONELLA.—*Haeckel.*

C. ventricosus (Plate IV., fig. 11) was not uncommon in July. Its form, small dimensions ($60 \times 42\mu$) and constricted neck sufficiently distinguish it.

C. lagenula Clap. and Lach.—Common in Malpeque bay, is similar in form, but has no foreign particles adhering to the shell.

PTYCHOCYLIS.—*Brandt.*

P. urnula (Clap. et Lach.) Brandt is a small form very easily recognized by its hyaline case, which is provided with two annular swellings and a thinner slightly inverted and toothed lip (Plate IV., fig. 19). The example observed approached Jorgensen's var. *minor*, in its dimensions ($96 \times 75\mu$).

CYTTAROCYLIS—*Fol.*

This genus is characterized by a wall formed of two lamellæ united by transverse plates. The most abundant form at Canso was *C. denticulata* (Ehrb.) Fol var. *gigantea*, Brandt (Plate IV., fig. 18), the tubes of which with their delicate reticular sculpture and toothed orifice were very abundant in the plankton in June and July. The average dimensions of the Canso examples were $470 \times 70\mu$, but shorter and stouter specimens occurred, approaching the variety *typica*, in which the length is only three times the breadth. The sculpture ceases as the case narrows to its delicate terminal spine, which is as a rule sharp, but occasionally terminates in a knob.

ECHINODERM LARVÆ.

Three of these were observed, viz., (1) The Pluteus of *Strongylocentrotus dröbachiensis* in its second stage. In addition to the two pairs of ciliated epaulettes at the base of the post-oral and posterior dorsal processes, there is a posterior ring. The greatest length of the larva, which occurred in the end of June and the beginning of July, is 1.25 mm. (Plate V., fig. 1). At a later date (2) an Ophiopluteus made its

appearance on July 11 (fig. 2), and a comparison of my sketches with Mortensen's figures (Nordisches Plankton IX., 16) induces me to refer it to Ophioglypha, of which *O. robusta ayres* is the common species at Canso. My sketches, however, are not sufficient to give an accurate picture of the form of the skeleton (Plate V., fig. 2). Still later, on July 18, (3) the first Bipinnariæ of *Asterias vulgaris* were recorded (fig. 3).

TREMATODES.

A few examples of what has been supposed to be the pelagic egg of a Trematode were detected in both years; such at least, is the interpretation placed upon these by Canu (Ann. de la Station Aquicol. de Boulogne-sur-mer, Vol. I., pt. 2, p. 112, Plate VII., fig. 8-9). The Canso specimens are longer and comparatively slenderer 290μ (of which 182 to tail) \times 50, while Canu's measure 150×42 .

The larvæ of *Hemiurus appendiculatus* Rud, and *Derogenes varicus*, O. F. Müller, diagnosed by Dr. Stafford, are found occasionally free, as well as in the interior of Copepods (*Acartia* sp. at Malpeque).

AN NELIDA.

Of the two families which are exquisitely pelagic in their habit, the Alciopidæ and the Tomopteridæ, only the latter was represented in the tow-net takings at Canso, and that by a single example taken out at sea in the end of August. (Plate V., fig. 5). From Apstein's account of the Tomopterids of the Plankton expedition, one would have expected that it would have turned out to be *T. helgolandica* or *T. septentrionalis*, but his excellent account enables me to diagnose it as a young example of *T. Mariana*. It measured 1.25 mm. in length, had the cephalic tenacles the two pair of tentacular cirri and five pair of parapodia developed, of which the two first carried yellow (phosphorescent?) 'rosettes' on the basal joint, while the middle line of the back had some twelve distinct pink spots, which were also present on the tentacular cirri of the parapodia. No rosette was observed on the fin of the third pair of parapodia.

LARVAL FORMS.

Before any satisfactory account can be given of these, it will be necessary to work over the adult Annelids of the region. Two Spionid larvæ, one of them *Polydora ciliata*, were very common, but I propose to confine myself here to registering the occurrence of some forms of particular interest. The Polygordius larva (Plate V., fig. 6) was frequent in July, as was also a Mitraria larva (fig. 7), but my attention was more arrested by a larva developing within an egg-membrane of peculiar character, of the systematic position of which I have not been able to satisfy myself. The embryo in question was first observed towards the end of July in an early stage of segmentation, with a large space between it and the peculiar shell of some 225μ in diameter. On the inner surface of the latter were to be seen numerous pear-shaped vesicles apparently opening to the exterior (fig. 8). Towards the end of the month a single ciliated band had been established and later a well-marked anterior bunch of cilia as well as a posterior ring (fig. 9).

Still later two bunches of provisional setæ, some 130μ in length, five in each bunch made their appearance (fig. 10), two brown eye-spots became obvious, and two caudal (sensory?) organs were observed. The shell lost the peculiar pear-shaped vesicles as development advanced; it was perforated by the cilia and bristles, and eventually was ruptured by the escape of the larva. This I observed towards the middle of September, but only detected a single example of such a free larva.

Another developing embryo of larger size, 555μ , related to the above, was also observed less frequently in September. The shell lacked the vesicular structures observed

SESSIONAL PAPER No. 22a

in the other case, but had a peculiar superficial sculpture and certain oval depressions (fig. 11) not related to the two ciliary rings whose cilia projected through the shell in separate tufts. Several of the oval areas were counted in front of the prostomial ring.

Since the above was written Leschke's paper* on the pelagic Polychæte larvæ of the Bay of Kiel has appeared, in which he records having met on one occasion with a larva similar to the former of these. He also cites previous records of similar occurrences which had escaped me, and from which I am able to state that the Canso larvæ obviously belong to the genus *Nerine*.

POLYZOA.

The only larval Polyzoan met with was the *Cyphonautes* larva of *Membranipora* sp. (fig. 12), which was abundant in June and July.

CRUSTACEA.

CLADOCERA.

Two genera were represented abundantly at Canso, viz.: *Podon* and *Evadne*. Of the former there were two species appearing at the end of July and of August respectively. I have not been able from my sketches to determine these with certainty, as the diagnostic features given by Timm and Hansen (the number of bristles on the exopodites of the various legs) are not recorded there. I suspect the earlier species, however, to be *P. polyphemoides* Leuckart, on account of its shorter tail lancets and smaller size, and the latter to be *P. intermedius* Lilljeborg. I find my sketches record that the caudal lancets of the larger species (Plate VI., fig. 1) are tinged with violet and toothed, also that the sculpture of the surface of the shell is different in the two species (figs. 1 and 2).

The two species of *Evadne*, however, are obviously *E. Nordmanni* Loven, and *E. spinifera* P. E. Müller, the former characterized by the greater elongation of the shell and the latter by the spine which it carries (fig. 3). The former species was abundant at the end of June, the latter common at the end of August. The first winter egg was observed in it on September 6.

OSTRACODA.

Only two species of this order were observed, neither belonging to the genus *Conchoecia*, so it is possible that the few examples observed are fresh water forms swept into the plankton.

COPEPODA.

Comparatively few of the numerous species of this interesting order occurring have been definitely diagnosed. The commonest forms are, however, recorded here.

SUBORDER GYMNOPLEA.

CALANIDAE.

Of this family the largest representative, a very abundant one in the earlier part of the summer, was *Calanus finmarchicus* Gunner. It attracts attention by its

*Leschke, Beiträge zur Kenntniss der pelagischen Polychaetenlarven der Kieler Förde. Wissenschaftl. Meeresunters: VII.-123. Cunningham and Ramage, Trans. Roy. Soc., Edin., XXXIII. Claparede & Metschnikoff Z. W. Z. XIX, p. 329. Krohn & Schneider Müller's Archiv, 1867, p. 498.

large size and by its transparent pale pink colouration. Fig. 4, Plate VI., is after Giesbrecht's figure of this species, and serves to call attention to the arrangement of the appendages in the order.

Pseudocalanus elongatus Boeck (Plate VI., fig. 5) was exceedingly abundant in July and August, and can be readily recognized by the orange pigment and the green of the vulvar region, as well as by the morphological features described by Giesbrecht. The eggs, about 100μ in diameter, are in a loose cluster, from 7 to 13, and spermatophores of 310μ length were frequently observed with a longer or shorter tube. The individuals frequently carried clusters of a diatom (*Lichmophora*, sp.). As Giesbrecht has noticed, the larva of *H. appendiculatus* (p. 12) is found in this copepod, but it also occurs in *Acartia biflosa*.

CENTROPAGIDAE.

Both *Centropages hamatus* Lilljeborg (Plate V., fig. 6), and *C. typicus* Lilljeborg were observed, the latter much less abundant and appearing considerably later than the former. They may be readily distinguished by the different armature of the genital segment of the female.

Temora longicornis, O. F. Müller, a northern form, was also abundantly represented.

PONTELLIDAE.

Tortanus.—This generic name has recently been substituted by Giesbrecht for *Corynura* (preoccupied), and expresses the remarkable distortion of the abdominal region which characterizes the genus. One species of this genus (*T. discaudatus* I. C. Thompson and H. Scott), Plate VI., fig. 9, was exceedingly common at Canso from the end of July to the middle of August. It was first recorded by the authors named from the Gulf of St. Lawrence and afterwards observed by Wheeler at Wood's Hole and described as *Corynura bumpusi*. I have little to add to the excellent account furnished by him except to suggest an explanation for the distortion of the furcal region. The second post-genital segment of the female carries a bunch of stiff hairs adjacent to that on the first, while the second abdominal segment of the male has certain grooves on the chitinized projection formed by the right posterior angle, as well as a few scattered bristles. In the right antenna of the male the first joint distad of the knee (19-21) carries two pectinate ridges, while the 17th and 18th joints have one each (fig. 11).

The explanation for the distortion of the abdominal region of the female (which is also transmitted in a less degree to the male) is furnished, I believe, by the mode of attachment of the spermatophore, which I had occasion to observe very frequently. The spermatophore itself is over 1 mm. long by 125μ wide. It is attached to the genital segment, in the ordinary way by a conical cement piece, but a much larger piece of yellowish cement is plastered on to the large right furca and its spine, and is connected with the beginning of the efferent canal of the spermatophore by a solid cord of cement of the same appearance (fig. 10).

Some cases were noticed in which an attempt had been made to attach a second spermatophore; in such the supplementary supporting patch of cement did not succeed in finding anchorage.

SUBORDER PODOPLEA.

CYCLOPIDÆ.

Oithona plumifera Baird (fig. 8) is one of the commonest forms of this section, and apart from its form can be recognized by the bright-red elongated eye-spot and a certain faint orange tinge in the abdomen. The spermatophores are pyriform, with a short stalk, and measure about 70μ .

SESSIONAL PAPER No. 22a

HARPACTICIDAE.

Microsetella atlantica Brady and Robertson (fig. 12) was frequently taken in the beginning of July. Ripe females are readily recognized by the long setæ, as long as the body (547 μ), the orange-red colouring which extends to the eggs disposed in a single packet underneath the abdomen, and the denticulation on the segments.

Harpacticus chelifera (fig. 13) is also common.

AMPHIPODA.

The commonest member of this order in the Canso plankton is *Euthemisto compressa* Goes, Plate VI. fig. 14. It was most abundant in June.

DECAPODA.

Throughout the month of July there was plenty of opportunity of observing the various larval phases of Cancer and two species of Pagurus. One of the latter which occurred towards the end of the month differed from the figures I have studied by the presence of sixteen setæ on the telson, and a rostrum which only reached to the middle of the basal joint of the antennulæ.

UNIDENTIFIED EGGS.

Two pelagic eggs are of very frequent occurrence. One of these (Plate VII., figs. 1 and 2) is that of a gastropod and is contained in a horny capsule which suggests in its shape a low wide-brimmed hat, and resembles closely the figures given by Hensen (l.c. Taf. IV., fig. 25-30) of his 'Barbierbecken-statoblast.'

A further resemblance to his figure 25 is that two eggs are frequently found in the cavity of the capsule. The dimensions, however, of these structures do not agree for whereas the whole capsule of Hensen's statoblast merely measures 200 μ , that of the egg in question is 675 — 775 μ , the flat rim measuring 140 — 160 μ or so, the capsule proper some 400 μ ; its cavity, (or cavities if there are two eggs) 140 — 150 μ , and the unsegmented egg about 120 μ . Segmentation had begun towards the end of June, the spheres having a certain pinkish hue by reflected light. By the eighth of July the shell and velar cilia could be made out. Larvæ ready to escape were observed up till the middle of August, but were not recognized in the plankton nor referred to the parent mollusc. Fig. 3 is a rough sketch of the shelled larva. I have not found any pelagic gastropod egg-capsules referred to in any of the literature accessible to me.

The second egg-capsule, commoner than the foregoing, I have not been able to localize even as definitely. It has something of the same form (fig. 4), viz., a subglobular capsule of 120 μ in diameter, with a thin rim 100 μ broad, which, however, unlike the former, does not lie entirely in the same plane, but is often much curled. The capsule is yellowish in colour and the rim shows a network of fine fibres (fig. 5). Empty capsules were common, and embryos (fig. 6) were observed in July and August within others, but I did not succeed in diagnosing them. These egg-capsules, when deserted, were frequently occupied by a species of Chytridium.

Among the numerous gastropod veligers found at Canso that of *Aeolis despecta* (fig. 7) was particularly common and attracted attention by its pellucid shell. Larvæ of the following Pteropods were also found, *Clione aurantiaca* (fig. 8) and two species of Hyalaeaceæ (figs. 9 and 10).

TUNICATA.

Although this Phylum furnishes a very large number of interesting forms belonging to the plankton, the only members of it found at Canso belong to the class *Cope-lata*, which permanently retain the tail and notochord of the larval Tunicate.

The excellent account by Lohmann of the forms belonging to this class, secured on the Plankton Expedition, renders diagnosis easy of the three forms found at Canso. Two families are recognized by him, one Kowaleskidæ, distinguished by the absence of the endostyle, the other Appendicularidæ, embracing all the remaining genera of the group. It is to the latter family that all the three species under consideration belong. The first of these to appear during the early part of July was *Fritillaria borealis* Lohmann (Plate VII., fig. 11). The length of the trunk of the example figured was 540 μ , of the tail 1 mm. Projecting from the lateral edges of the trunk posteriorly are two processes like those which mark the species *F. pellucida*. No signs of the 'house' of the species were observed.

The two remaining species belong to the genus *Oikopleura*, distinguished from the foregoing by the plumper form, and by the circumstance that the fin of the tail begins at its attachment, not at some distance therefrom as in *Fritillaria*. *O. labradoriensis* Lohmann replaced the foregoing during the latter end of July, while *O. dioica* Fol was very abundant in the latter part of August. These can be at once separated by the fact that the former has some 16-18 globular 'subchordal' cells under the notochord in the latter half of the tail, while *O. dioica* (figs. 12, 13) has two stellate cells in the same position. It is the only dioecious species; ripe females with eggs 70 μ in diameter were observed on August 20. Although like other strictly pelagic creatures for the most part transparent, *O. dioica* shows some traces of pigment in its intestinal tract, the œsophagus having a faint pinkish hue, while the rest of the intestinal wall, and especially the large gastric cells of the left compartment of the stomach, are decidedly violet. This species appears to live on a small green Flagellate (8 μ in diameter) which I only observed in its stomach.

NOTE.—Through inadvertence some of the literature has been cited in the text, and some by the numbers which follow:—

II

THE EFFECTS OF DYNAMITE EXPLOSIONS ON FISH LIFE.

A PRELIMINARY REPORT BY PROFESSOR A. P. KNIGHT, M.A., M.D.,
QUEEN'S UNIVERSITY, KINGSTON, ONT.

In issuing his announcement of the opening of the Dominion Biological Station for the season of 1901, the director, Professor Prince, suggested that some experiments should be undertaken 'on the wastefulness or otherwise of fishing with dynamite.' It was subsequently arranged that this should be my work for the summer, and the requisite permission to use dynamite having been obtained from the Ontario Fishery Department, Toronto, and from the Department of Marine and Fisheries, at Ottawa, experiments were begun the first week of July, 1901.

ACKNOWLEDGEMENTS.

Before beginning this report, I must acknowledge indebtedness to E. Abbot Johnson, Esq., L'Original, Ont., for hospitality and assistance, in carrying out experiments on the Ottawa river. Also, to my colleague, Dr. J. C. Connell, for the use of his launch in carrying on the experiments in Kingston harbour, and similar indebtedness to the Messrs. Whitman Bros., for extensive use of the tug 'Vulcan' off Canso harbour. It would have been impossible to carry out this investigation without the assistance given by these gentlemen.

DYNAMITE.

The dynamite used was the variety known as dualin and has the following composition:—

Nitroglycerine.	40 parts.
Fine sawdust or wood flour.	30 "
Potassium nitrate.	20 "

It is usually sold in cylindrical sticks, or cartridges, of two sizes, one being six, the other eight inches long, and about $1\frac{1}{4}$ inches in diameter. The cartridges are encased in oiled paper, and done up in five pound packages. Each package contains 6 small cartridges, and 14 large ones, and costs about \$2; that is, a little over 8 cents per cartridge for the small ones, and about 10 cents for the large. Fuse costs 75 cents per hundred feet, and caps or detonators about 75 cents per hundred.

The dynamite used at Canso was that manufactured by the Acadia Powder Company, Halifax; that used on Lake Ontario was obtained gratis from the Ontario Powder Company, at their head office, Kingston, and Mr. Smith, the general manager, kindly instructed me how to use the explosive, and furnished me with a copy of the pamphlet, which they send out to their customers. The following are extracts from it, so far as they have a bearing upon my work:—

INSTRUCTIONS.

'Dynamite, when properly used, is perfectly safe, but like all compounds of nitro-glycerine, must be handled with care and judgment. Although it will explode, if roasted up to a high temperature, it burns quietly if set fire to. In order to cause the explosion in practical use, therefore, it must be fired by means of an ordinary 'Detonator' with fuse, or by 'Electric Detonators' with a battery.

For the former, cut off a piece of fuse to a proper length, straight across, shake all the sawdust out of the detonator, and push the fuse into it gently, nearly as far as it will go, and close the edges of the cap down on to the fuse. Then, if to be used under water, cover edges of cap with soap, grease, tar, or a similar substance, to keep charge inside of cap dry.

Now, with a small punch, like a pointed lead-pencil, make a hole through the paper in the end of a cartridge of dynamite, as deep as the length of the detonator. If cap has been properly fastened to the fuse, the punched-in edges of the paper after cap is inserted will prevent its being pulled out, in lowering into the drill hole.

'CAUTIONS.

'Dynamite freezes at 42° Fahrenheit, and when frozen it is almost impossible to explode by cap, although it is more sensitive to rough handling. In cold weather, therefore, care should be taken to thaw it until it becomes soft. It is dangerous to do this before a fire. The proper method is to thaw the cartridge by means of a 'Thawing Box,' such as we make and sell at cost, or to keep them in a warm room for several hours before using, and to carry them to the work in a sack, wrapped up in a way to prevent chilling before using, as dynamite at the freezing point, is more sensitive to handling than at either a higher or lower temperature.'

All the explosions at the seaside, and half of these at Kingston, were made by means of a fuse and detonator. Some difficulty was at first experienced in producing explosions at depths greater than ten or fifteen fathoms, but by closing the detonators very firmly round the end of the fuse, covering the joint carefully with common soap, and sinking the detonator well into the dynamite, we succeeded in getting explosions in water as deep as 50 fathoms. When these precautions were not taken, the increased pressure at the greater depths forced water into the caps and prevented the fulminate of mercury from exploding. The difficulty in getting explosions along the Ottawa river was due to the fact that the fuse was not water tight.

In water from 18 to 25 feet deep, no sinker were attached to the cartridges; but in 30 to 50 fathoms, stones or old pieces of iron were used to sink the dynamite as quickly as possible.

LAKE ONTARIO EXPERIMENTS.

The first experiments were made in Kingston harbour, in water about 18 feet deep. Two cartridges were used, the detonation striking our boat like a huge sledge hammer. It stirred up a great deal of mud, and discoloured the water to a radius of 6 or 8 feet, gradually widening to 30 or 40 feet. At first we thought that no fish had been killed, but after waiting for about two minutes they began coming to the surface, and inside of 15 or 20 minutes, 130 perch and 1 small black bass had been lifted into the boat. About three dozen more were left floating; all were not dead; some appeared to be only stunned.

Post-mortem examination of a large number of these fish all showed similar effects: great capillary hæmorrhage from branches of the mesenteric arteries, congestion of the liver and spleen, and invariably rupture of the swim bladder. Portions of the intestines were usually forced dorsally into the cavity of the swim bladder, where, of course, there was also much blood. In rare cases, there was rupture of the venous sinuses feeding the auricles.

SESSIONAL PAPER No. 22a

VARIATIONS IN DESTRUCTIVENESS.

The first explosion and its results were typical of all the work done last summer. Of course the results were not constant, for obvious reasons. The destructiveness of the explosive varied according to easily recognizable conditions. It varied with (a) the charge of dynamite used, (b) with the depth of the water, (c) with the number of fish present in the neighbourhood of the explosion, (d) with their distance away, and (e) with the kind of fish.

That the destructiveness varies with the weight of dynamite exploded, needs no demonstration. This is probably true of all explosives. Many different charges were used, usually varying from one cartridge up to eight. The larger charges did not always result in bringing up the larger number of fish. The number killed depended more upon the number of fish in the neighbourhood than upon any other condition. For example, a charge of $1\frac{1}{2}$ lbs. exploded in the Kingston harbour, west of Garden Island, did not bring up a solitary fish, while one cartridge of $\frac{1}{4}$ lb. weight in St. John harbour, New Brunswick, killed over 800 fish.

The depth of the water was another important condition affecting the destructiveness of dynamite. Explosions were effected at depths varying from $1\frac{1}{2}$ to 300 feet. It produced little, if any, destruction of fish life at shallow depths, say, less than 10 to 12 feet. The reason of this probably is, that at slight depths, the pressure resulting from the explosion is not sufficiently great to rupture the swim bladder. One blast at 18 inches under the surface, sent up a column of water about 100 feet high; another blast about 3 feet below the surface sent up a narrow column about 60 or 70 feet high. In neither case were fish killed, though some must have been present. At 10 or 12 feet below the surface, the explosion lifted a broad cone or mound of water 6 or 8 feet high. At increasing depths, the surface disturbance became less and less marked, until at 45 fathoms or thereabouts, the only evidence of the explosion, after the noise and the tremendous blow on the bottom of the boat, was the appearance of a vast number of small bubbles of gas covering a diameter of from 40 to 60 feet. There was no upheaval of water. Evidently the large volume of gas generated at these depths is, on its way towards the surface, broken up into a large number of distinct bubbles, which separate as they ascend.

As regards explosions at increasing depths, a few of our results may be tabulated as follows:—

No. Expt.	Wt. of Dynamite. Lb.	Depth of Water, in feet.	Depth of Cartridge, in feet.	No. of Fish Killed.
1	$\frac{1}{8}$	12	12	0
2	$1\frac{1}{2}$	14	12	0
3	$\frac{1}{2}$	10	10	0
4	$\frac{1}{4}$	26	18	300
5	$\frac{1}{4}$	25	18	160
6	$\frac{3}{8}$	24	18	35

It is difficult to say whether in Nos. 1, 2, and 3 there were no fish present, or the pressure was insufficient to kill them. The probable explanation of the difference between the number killed in No. 4, as compared with those in No. 5, is that many more fish were present in the vicinity in the former case than in the latter.

No. 6 illustrates another variation in the effects of a dynamite explosion. In this instance not a single fish came up where the explosion occurred. About 30 yards away, seven or eight sunfish were killed outright—not a movement in one of them when picked up. A few moments later, a batch of perch and a few rock bass were seen coming to the surface about 60 yards away. Clearly, therefore, the number of fish killed varies directly with the number present, and varies also with their distance away from the site of the explosion.

Lastly the number killed depends upon the kinds of fish. Those with a thin, delicate texture of the swim bladder are more easily killed than fish possessing a thick,

tough membrane. Pollock were very easily killed for this reason; cunner, very difficult.

Stated mathematically, the energy of the exploding dynamite varies directly with the amount exploded, and diminishes with the distance away, according to an undetermined law, which probably depends upon the relative position of the exploding charge to the bounding water surfaces, upon the nature of the bottom, and possibly also upon conformation. So far as fish are concerned its effects upon them were found to vary (a) with the numbers near the site of explosion, (b) apparently with their depth beneath the surface, and (c) with the strength of their tissues, especially the walls of the swim bladder, and the sensitiveness of the nervous system, though this last was difficult to demonstrate.

CAUSE OF DEATH.

As already indicated, the immediate cause of death is rupture of the swim bladder, and internal haemorrhage. The rupture is evidently due to pressure. When an explosion occurs, there is a sudden liberation of gas tending to produce compression of the water at the site of the explosion. The wave of compression travels outwards in all directions—upwards, downwards and sideways. The direction of least resistance is, of course, always towards the surface of the water—hence the upheaval which follows an explosion. Quite frequently we found three other marked injuries, especially in large fish like pollock. Often in these the liver was compressed into fragments, the ribs were detached from the vertebrae along the whole length, and the flesh (temporal muscle) over the skull, after the skin had been cut, could be raised from the surface of the bone, leaving it as smooth and clean as a piece of polished ivory. Here again, the cause of the dislocation of these structures was pressure. The fish is veritably flattened between the compression wave of the explosion on the one side, and the unyielding water on the other; the ribs are torn from their attachments, the liver crushed to pieces and forced backwards into the extra-peritoneal cavity, and the flesh raised clean off the flat bones of the head. The surgeon sometimes meets with a similar experience in accidents due to crushing.

No external marks or injuries were visible on any of the fish, in either fresh or salt water.

SINKING FISH.

Very early in the investigation it became evident that besides those fish which came to the surface and floated, a number were merely stunned, and subsequently escaped, or were killed outright and sank to the bottom. This was important. The destructiveness of dynamite took on a wider aspect than that of merely counting the slain. The wounded and missing had, if possible, to be accounted for. If one could put off a blast in a large pond, count those killed at the surface, drain the pond dry, and then count the living and dead lying on the bottom, the investigation could soon be closed; but this was not the way in which the problem was presented. Accordingly other methods of investigation had to be planned. A simple method, and one likely to throw some light upon these points, was to use the water telescope. This was done in some of the narrow channels off Canso. Cunner abound in the shallow waters along these shores and between the islands, and after some expert knowledge had been gained by using, first a stove pipe and then an old eaves pipe for an aquatic telescope, we put off a blast, and counted our 'spoil.' Twenty-five dead floated belly up: that was one fact, or collection of facts, if you please. Then by the persevering use of our improvised telescope, one observer counted seven, and another of our party counted eleven dead cunner lying on the bottom. We recovered two of these. Post-mortem examination failed to show particularly why they had sunk. There was great visceral congestion, and profuse haemorrhage. In one, the swim bladder was much torn, while in the other, the rupture was so small that no air could be found escaping, except when the whole animal was

SESSIONAL PAPER No. 22a

placed under water and the swim bladder compressed. The smaller animals generally floated; the larger ones sank.

These results were, however, not satisfactory. In shallow water, explosions always stirred up the mud, and our crude telescope was useless. We determined, therefore, to make a tremendous 'slaughter of the innocents,' and with this end in view selected a small bay, nearly west of Grassy island, and there, set off the largest blast of dynamite which was used during the season—ten cartridges. The noise was loud enough to have awakened the spectral inhabitants of the old French island. There was a tremendous upheaval of water and mud, and in ten minutes wind and tide had spread the dirty water all over the little bay. Twenty-eight dead came to the surface. On returning next morning, we could find only three dead fish lying on the bottom, near where this explosion had occurred; that is, less than ten per cent had sunk in this experiment; in the previous one about thirty per cent.

The next attempt that was made to throw fresh light on this important point was in St. John harbour, New Brunswick. As a preliminary to the real test, a visit was made to one of the salmon weirs at low water. In one compartment of the weir were found two full-grown salmon, one 'fiddler' (small salmon), and ten or twelve adult gaspereau. The time was noon of August 10th. That evening, of course, there was a full tide, and next morning another, so that there were these two chances for additional fish to join their fellows in the weir. At 8.30 next morning, the weir was visited in company with the two fishermen who owned it, and one cartridge was exploded in the compartment which we had previously examined. The two salmon at once floated to the top, also six or eight gaspereau. But the deadly effect of the explosive was brought out in another, and rather unexpected way. Almost simultaneously with the occurrence of the explosion, an immense number of young gaspereau leaped from the water, and then fell back almost motionless upon the surface. They varied in size from $2\frac{1}{2}$ to 5 inches in length. They came partly from inside the weir, but chiefly outside the inclosure, stretching away up towards the city. Evidently a school of these young fish was making its way up into the harbour, or they were leaving it. We counted over 800 of them being driven away by the wind and tide, and estimated that as many of them sank as floated; but this was, of course, mere guess-work.

After rowing along the path of these floating fish for half an hour, we returned to the weir, and awaited the falling of the tide. The tide in this harbour goes out so far that the floors of many of the weirs are left almost dry. We had no difficulty, therefore, in determining the exact number of fish which sank. There they were, 27 gaspereau varying from 7 to 12 inches in length, lying dead on the bottom; 7 others somewhat larger on the average were swimming around in the scanty water remaining in the weir, and in company with these, 2 lively dog-fish which seemed to know perfectly well that they were in a trap. Here were the results which we had been looking for—8 or 10 killed and floating, 27 killed and sunk, and 9 alive. If the dynamite killed the young gaspereau in the same proportions outside the weir, as inside, then 2,500 of them lay dead at the bottom of the harbour in addition to the 800 which we had counted at the surface.

CAUSE OF FLOATING.

Nearly all the fish floated belly up; the sunfish lay more upon their side; lake trout on their back, but with the tail end deep in the water and head above it. Rupture of the swim bladder and escape of its gas ventrally so as to displace the centre of gravity, was probably the cause of the fish floating on their back. But a physiologist can scarcely escape the conviction that the nervous mechanism for the maintenance of equilibrium must have been paralyzed in all of them. Fish which die in water from other causes than concussion, say, from suffocation or from poison, lose their power of maintaining the vertical position, and in these cases they lie on their back because of muscular (i.e., nervous) inability to balance themselves.

WOULD IT PAY.

An attempt was made to see whether a large catch of fish could be obtained in the open sea by means of dynamite. The fishermen at Grand Manan were said to have made it pay during the summer of 1900, and better still in 1901. At any rate, a young seaman whose acquaintance I made through Mr. C. H. Whitman at Canso, claimed to have used dynamite at Grand Manan during June and most of July, 1901. He said that 'whereas only half a dozen vessels had used dynamite in 1900, there were about 90 using it in 1901. It was exceedingly effective with pollock, when they were plentiful and following the red shrimp. They used only one stick of dynamite and exploded it by a detonator and fuse two or three inches long. The men lighted the short fuse with a match or the burning tobacco of their pipes, and then threw the cartridge into the sea from the boat. They judged that the explosion took place about six feet below the surface, but could not say exactly to what depth the cartridge sank before exploding. Hundreds of pollock were killed by one explosion. He was of the opinion that from one-half to one-third of the fish sank and were lost. Other fish were killed besides the pollock. When the shrimps are all eaten up or disappear, the pollock begin feeding upon herring and squid, and consequently separate widely from each other. Under these circumstances, it was not found profitable round Grand Manan to continue the practice—too few being killed to pay for the dynamite and the men's time in collecting the scattered fish. Asked upon what grounds he had formed the opinion that from one-half to one-third sank, he answered that he had come to that conclusion on two grounds: first, by watching the fish sinking after an explosion; and secondly, because on one occasion at Digby inlet he had seen a blast put off beside the wharf in order to kill pollock. After the tide went out they counted as many dead fish on the bottom as they had collected at the surface.'

Such was the substance of the man's story. It remained for us to see how far our experience would confirm his. At the outset, let it be said that although there were six men on board the *Vulcan*, two being experienced fishermen, and all watching eagerly for results, it was generally agreed that it was impossible (by merely watching the surface) to form an opinion as to the number of fish that sank, as compared with the number which floated. We all saw one or two fish sink after some of the explosions, but not one of us from our own observations could confirm the young fisherman's opinion that one-half or one-third sank.

Our experience in St. John harbour compared with his in Digby inlet, showed that three times as many lay dead on the bottom, but they were not pollock.

As regards our experiments in the open sea, the following were typical:—

EXPERIMENT No. 1.

Dynamite, No. of sticks.	2
Depth of water, in fathoms.	7
Depth of dynamite down in water, fathoms	2
No. of fish killed. pollock	20

One or two fish were observed to sink and not come to the surface again.

EXPERIMENT No. 2.

Dynamite, No. of sticks.	4
Depth of water, in fathoms.	7
Depth of dynamite down in water, fathoms.	2
No. of fish killed. cod	2

SESSIONAL PAPER No. 22a

EXPERIMENT No. 3.

Dynamite, No. of sticks..	2
Depth of water, in fathoms..	45
Depth of dynamite down in water, fathoms..	3
No. of fish killed.. pollock	7

EXPERIMENT No. 4.

Dynamite, No. of sticks..	4
Depth of water, in fathoms..	45
Depth of dynamite down in water, fathoms..	3
No. of fish killed.. pollock	1

In experiments 3 and 4 the pollock were schooling all around the boat, evidently chasing squid, which could easily be seen in the water. The eight fish taken in experiments 3 and 4 were all very large specimens. It was hoped that as the explosions took place among considerable numbers of fish, a large 'catch' would be obtained, but such was not the case.

EXPERIMENT No. 5.

Dynamite, No. of sticks..	2
Depth of water, in fathoms..	30
Depth of dynamite down in water, fathoms..	Unknown.
No. of fish killed.. pollock	8

In this case the dynamite was simply dropped into the sea, but in most of the experiments it was lowered a fixed distance by line.

EXPERIMENT No. 6.

Dynamite, No. of sticks..	2
Depth of water, in fathoms..	30
Depth of dynamite down in water, fathoms..	30
No. of fish killed..	0

The dynamite was attached to a heavy piece of iron and the explosion took place at the bottom. There was no upheaval of water. The bubbles of gas, already alluded to, came to the surface very quietly, and had to be closely watched for, in order to be seen at all. This was characteristic of all the deep explosions.

EXPERIMENT No. 7.

Dynamite, No. of sticks..	2
Depth of water, in fathoms..	40
Depth of dynamite down in water, fathoms..	Unknown.
No. of fish killed.. pollock	5

In this experiment it was at first supposed that no fish had been killed; but between fifteen and twenty minutes after the explosion, one fish was picked up; five minutes later a second fish; a few minutes afterwards three more fish. They all exhibited the same peculiarity, viz., that they made repeated and successful attempts to descend into the water, but, within a few seconds they were compelled to come again to the surface.

EXPERIMENT No. 8.

Dynamite, No. of sticks..	2
Depth of water, in fathoms..	30
Depth of dynamite down in water, fathoms..	30
No. of fish killed..	1 pollock

This fish came up fifteen or twenty minutes after the explosion.

EXPERIMENT No. 9.

Dynamite, No. of sticks..	2
Depth of water, in fathoms..	30
Depth of dynamite down in water, fathoms..	Unknown.
No. of fish killed..	2 pollock

EXPERIMENT No. 10.

Dynamite, No. of sticks..	2
Depth of water, in fathoms..	30
Depth of dynamite down in water, fathoms..	Unknown.
No. of fish killed..	0

EXPERIMENT No. 11.

Dynamite, No. of sticks..	2
Depth of water, in fathoms..	30
Depth of dynamite down in water, fathoms..	Unknown.
No. of fish killed..	0

In 9 the two pollock came to the surface ten or twelve minutes after the explosion.

Judging from our experience on the *Vulcan*, dynamite fishing cannot be made a commercial success out on the open sea. A few cunner were generally killed, but having no market value, were not counted in our results. We saw no young fish come to the surface during the whole day. Nor could it be said in our experience that pollock were frightened away. After the first day we were out on the bay, we heard that the owners of the small fishing boats were protesting against our operations, as likely to frighten away the fish from their usual haunts. But their fears were groundless, because two days afterwards the pollock were back again in greater numbers than before, and notwithstanding continued experiments on our part, the very best harvest of the season was reaped after our experiments had been concluded. Fishing folk, like other people, often cry before they are hurt.

LOBSTER EXPERIMENTS.

The young seaman already referred to, told a doleful tale of a poor lobster fisherman, who suffered a heavy loss through the explosion of a single stick of dynamite. The fisherman had saved up his catches of lobster by confining them in a pound, in anticipation of a rising market. The pound is a cubical box made of wooden slats, just close enough together to prevent the escape of the lobsters. The box is usually anchored out a short distance from shore, and as the water enters freely through the slats, the lobsters get enough aerated water to live on, if there are not too many of them, and if there is enough of a breeze blowing to create a current in the water. The young seaman's story is that when the lobster fisherman had accumulated about 500 animals in his pound, some mischievous or ignorant person put off a dynamite blast about 150 or 200 yards away, and killed every lobster. As he first told the tale, the lobster pound was 500 yards away, but on cross-examination he was compelled to reduce the distance.

SESSIONAL PAPER No. 22a

To test the accuracy of this story, six lobsters were obtained from a local fisherman. They were secured on the plea that the biologists required them for scientific purposes. The open season was over, and many of the lobster pots were lying high and dry along the shores, but on sailing out to the sand bar, or to Bass rock, it was easy to see that some of the fishermen were using lobster traps for 'scientific' purposes as well as ourselves.

The first experiment consisted in putting off a blast of 3 large sticks of dynamite at a distance of 80 feet from a trap containing 2 lobsters, and at a distance of 40 feet from a small lobster that was tethered by a piece of twine. The explosion produced no effect whatever upon any of the lobsters.

In the second experiment 2 large sticks of dynamite were exploded at a distance of 20 feet from the small lobster. The animal was uninjured so far as we could see.

The third experiment consisted in setting off two sticks of dynamite within 10 feet of a medium sized lobster. No result.

Finally, 3 sticks were exploded 15 feet away from a trap which contained 5 lobsters. These animals had all been used in the previous experiments. The explosion overturned the trap, nearly overturned one of the piles on which the wharf was built, but it seemed to have no effect upon the lobsters.

We concluded, therefore, that the 500 lobsters of the sailor's yarn had died—not from the effects of a dynamite explosion, but from suffocation. They had been confined in too small a pound for too great a time, and the explosion was co-incident with the fisherman's discovery of their dying condition.

Further experiments are necessary to determine the effects upon lobsters at considerable depths, ours being at 12 to 15 feet.

ON THE OTTAWA RIVER.

Experiments on the Ottawa river were conducted at only one point, viz., about half a mile below L'Original village wharf. Twenty years ago, this point was considered a fine spot for pickerel, but to our amazement we obtained nothing but bullheads and suckers. The villagers and inhabitants generally claimed that the government dam at Carillon prevented the fish from coming up the river as they used to do, and that the better kinds of fish were decreasing in number.

EFFECTS ON MINUTE LIFE.

After several explosions in fresh water and one or two at sea, a small tow-net was drawn over the site of the explosions and the material collected was examined under the microscope the next day. Many living organisms such as copepods, phyllopods, &c., were found, and also dead ones, but it was impossible to determine whether the latter were dead when caught, or had died during the night.

Are fish eggs and larvæ killed by dynamite explosions? Because, if they are, this is one of the strongest objections that can be urged against the practice. Here again surface netting failed to show that the percentage of dead eggs or larvæ was increased to any appreciable extent. As is well known pelagic ova and fry both live near the surface of the sea, and it is difficult to understand how these, or any other tiny organisms could be killed by dynamite explosions any more than by the waves of a big storm. Of course, eggs which are laid on the bottom would certainly be destroyed, if they were near the site of any explosion, but further investigation is necessary on these points.

EFFECTS ON THE NERVOUS SYSTEM.

The brains of a dozen fish, half of them killed by dynamite, and half caught by hook and line, were preserved and subsequently examined under the microscope. Leitz

6-7 EDWARD VII., A. 1907

objectives 3 and 6, and ocular 3 being used. On comparison with each other no differences could be observed in their minute structure as a result of their different modes of death. One would expect that there should be differences, but none could be discovered by the methods which were employed.

KILLING OF SEAL.

An interesting result was obtained at St. John, N.B., at the instance of the fishermen. They often lose many salmon, through the depredations of sea-lions or seal. These animals regularly frequent weirs and kill numbers of the imprisoned fish. The fishermen naturally wished to know if seals could be killed by dynamite. Fortunately one of these animals happened to come up the harbour just as our other experiments were concluded. The men rowed out, and a blast of two cartridges was thrown towards the seal just as he dived, forty or fifty feet away. After disappearing under water he must have swam towards the impending explosion. When the tide went out, greatly to the delight of the fishermen, he was found dead sixty or seventy yards away. A deep hollow in the mud marked the site of the blast. Blood was oozing from the eyes, ears and nose of the animal. Evidently he had been killed by fracture of the skull.

CONCLUSIONS.

1. A serious result was clearly brought out in many of the experiments. Large numbers of immature fish were killed. Not one-third of those which came to the surface in fresh water could be sold in the market. Of course, immature fish are killed in other ways. Thousands of young fish perish in weirs all along our coast after every outgoing tide. Fishermen frequently leave them to rot upon the shore. The responsibility for this terrible destruction of immature fish rests in the first place upon the apathy and cupidity of the fishermen, and in the second place upon the Dominion government for allowing the slaughter to continue. Fishermen should be compelled to return immature fish to the sea, because so long as this destruction of young fish is permitted in netting, it is manifestly unfair and inconsistent to prohibit dynamite fishing on the score of its wasteful destruction of immature fish.

2. The second serious objection is the great waste due to the numbers which sink. It would be hardly fair to generalize upon the experiments at Canso and St. John. It is much safer to publish the facts, and the facts are that about one-third of the cunner sink, and that three gaspereau sink for every one that floats. As regards pollock, cod, salmon and other marketable fish, further investigation is necessary if a general conclusion is worth having.

3. Further investigation is necessary also to determine more accurately the effects upon the microscopic life of our inland and marine waters, for such microscopic life is a necessary part of the sustenance of the finny tribes.

KINGSTON, August 9, 1902.

III

ON THE FAUNA OF THE ATLANTIC COAST OF CANADA.

AN INTRODUCTORY REPORT

BY J. STAFFORD, M.A., PH.D.

(*Lecturer in Zoology McGill University, Montreal, Curator of the Canadian Marine Biological Station.*)

The establishment of a marine biological station for Canada offered an opportunity for a zoological survey of our eastern coast waters. Although the task must be a long and arduous one, yet enough has already been done to indicate some interesting features in the Atlantic marine fauna and to show the advisability of continuing its investigation. Before the establishment of the station, thanks to the enthusiasm of certain zoologists of Canada and of the United States, there had already been published a number of valuable lists of many classes of animals. But with the advantages of a portable laboratory, moving periodically and by successive stages along our coast, and equipped with the more necessary appliances, facilities have been furnished for a fuller systematic survey than was otherwise possible. The development of a marine laboratory must itself be gradual, and in the initial stages of its growth we can not look for the same thoroughness or comprehensiveness of results as in the later stages to which fall the legacies of a more complete outfit for collecting, and improved apparatus for experimenting, together with a more inclusive library and an experienced staff.

The biological station has been in existence since 1899; the first two seasons were spent at St. Andrews, New Brunswick, and the succeeding two at Canso, Nova Scotia.

In the summer of 1899, several weeks before the carpenters had completed the building at St. Andrews, a small but enthusiastic staff of workers commenced researches there. A row-boat or a hired sail-boat was alone available, and much time was lost in reaching the best grounds, indeed it was often out of all proportion to the real time of collecting; but there was the advantage of a rich faunistic district, offering many facilities for collecting from shore.

In 1900 there was built a 22-foot gasoline launch which gave only a few weeks' service and then had to undergo some change of fittings. A small steamer, the *Annie*, of St. Stephen, was hired for about the same length of time, in which longer trips were made. Altogether the work of the staff at St. Andrews occupied seven weeks of the first year, and fourteen weeks of the second.

In the spring of 1901 the laboratory was mounted on a scow, built at St. John, and was towed around the coast by the Dominion fishery cruiser *Curlew* to Canso N.S. Here, through the liberality of the Messrs. Whitman, one or more of the staff had the advantage of being frequently taken to the local fishing banks on their steamer *Active*, whose crew also often brought back 'curios' captured by their trawl-hooks. On a few occasions also the same firm kindly gave the use of their tugboat *Vulcan*, and several men, with which to test the 12-foot beam trawl used for experiments.

Upon resuming work at Canso in 1902 the launch was put in order, and, while very useful for short distances, she proved not sufficiently speedy or even safe to venture out to deep water. As the station could not derive much benefit from the *Active*, herself and crew being employed for the greater part of our period of work by the wrecked *Blaamanden*, the staff was so far at a disadvantage. From a consideration of our means of locomotion up to the present, it seems worth while to mention that the first requirement of the station is a vessel large enough and sufficiently seaworthy to carry on work in deeper waters. This has been continually apparent at

6-7 EDWARD VII., A. 1907

Canso, where we could scarcely go any distance from home without being exposed to some danger in the open sea. The coast being bold and rocky yields little to the shore collector and, as a consequence, reliance had to be placed on netting and dredging. But these again we could only perform near shore and for the latter a rocky bottom is unproductive. Rarely has the dredge been used beyond fifty fathoms, and this for two reasons: first, because of our inability to go far out from shore, and second, because of the impossibility of hauling up the dredge by hand from a much greater depth.

Work was conducted at Canso 17 weeks in 1901 and 19 weeks in 1902—in the first of these years for a month before the arrival of the station, in the second, which was the longest term yet spent at the station, from May 1 to September 20. May and part of June were so cold and windy that it was unsafe to venture against the unmanageably rough seas. Hence time was profitably spent in collecting from shore, examining fish brought to the wharfs by steamers and schooners, or working over former collections made at the station.

With these brief references to the areas examined, the time spent in work each season and the means of visiting various localities it is appropriate to mention the methods of collecting. These of course differ according to the nature of the collecting ground and the kinds of animals sought. An excursion along the shore, especially after a storm, yields animals washed up on the beach, some of which, like sponges and jelly-fish, may have been brought long distances. An examination of the sea-weed may prove fruitful in crustacea, snails, worms and the like. With long rubber boots, a pail and a dip-net, one can wade in the water and look for ctenophores, shoals of shrimps and small fish. The turning over of stones between tide marks is most fruitful and reveals numerous species of worms, clams, &c., which may also be procured by digging with a spade into gravelly, sandy, or muddy ground in similar localities. About low-water mark is often to be found a different assemblage of animals, consisting of star-fish, brittle-stars, sea-urchins, sea-cucumbers, &c., and flat stones below the lowest tide-marks may shelter under them sponges, worms, molluscs, echinoderms, tunicates, &c., as well as the eggs and larvæ of many different species. Much can be learned by such procedure, and sometimes one may come upon rare specimens in the most unexpected positions.

With a boat the piles of wharfs, the timbers of piers, the stakes of brush-weirs, the sides of ships below the water-line, may be examined; old lobster pots and such objects, that may have lain for some time in the sea-water, may be hauled up and searched; and the shores of islands reached and investigated. On the way the water is scanned and the dip-net is kept to hand, a large net may be towed behind the boat, or small close-meshed nets may be towed along the surface or weighted to sink to different levels. These catch the small adult forms and larvæ that constitute the food of many fish, and some of the latter may be obtained by hook and line, while others may be secured in shallower water. To procure animals that live on the bottom a dredge, consisting of a quadrangular iron frame with a net attached at one side and a bale at the other, is dragged by a long rope let out behind the boat. The flat jaws of iron scrape off sponges, mollusca, echinoderms, &c., from the rocks which fall into the net behind, or collect shells and stones with hydroids, bryozoa and tunicates attached or mud containing worms and shells. Both the propulsion of the boat and the hauling of the dredge are best performed by machinery, but the smallness of the station's boats prohibits the use of a winch. Generally it has been found more productive to row the boat. Propelled by sail or by the engine the speed is usually sufficient to raise the small dredges off the bottom, but often good catches have been made by simply allowing the boat to drift with the wind or in a surface current. The beam-trawl, already mentioned, consists of a strong beam 12 feet long supported on runners a couple of feet from the ground. Behind is attached a large long-pointed, coarse-meshed net of strong cord. The lower lip of this is strengthened by a rope weighted by small rods of lead, and hangs loosely on the ground into the depressions of which it falls. A rope bale is attached in front, and the whole is dragged by a long rope

SESSIONAL PAPER No. 22a

after a vessel under considerable headway. This covers a greater area than a dredge, and besides collecting many of the same kinds of animals it also picks up larger objects and captures fish—particular^y flat fish.

We have hitherto considered only those animals that are to be found on the surface, or that live deeper in the sea, those that feed on the bottom, that burrow in the ocean-bed, or that creep over rocks or seaweeds. There are others that gnaw their way through and destroy the timbers of wharfs and ships, as well as those that creep over the surfaces of larger animals or fix themselves to definite parts of the skin or gills. One step further, and the collector may find animals that have penetrated into the bodies of others and have even become so completely reconciled to their new homes that they could not possibly continue to live if they were set free.

Live animals taken to the laboratory can usually be kept some time by occasionally changing the sea-water. Better results are reached by supplying the small glass aquaria with sea-weeds, gravel, &c. At Canso two coal-oil pumps were worked at the station so that both salt and fresh water were supplied to the laboratory tanks, and when necessary the aquaria could be thus continually replenished with fresh sea-water. In this way many animals, like sea-anemones, could be induced to expand their tentacles and give an opportunity for their study more conveniently than in their natural habitat.

The first location of the station at St. Andrews presented many special advantages. Its southerly sheltered situation implied, close at hand, a rich and varied fauna, while further out deep-water forms were also obtained, in Passamaquoddy bay and the entrance to the Bay of Fundy. Passamaquoddy bay, screened from the great Bay of Fundy by a chain of islands, is a body of water some 15 miles long by 7 broad. The tide rises and falls about 28 feet, making an enormous difference in the appearance of the shore and exerting a vast influence not only upon the habits of many marine animals, but even extending to the inhabitants of the coast. At many places the falling tide exposes this depth of nearly perpendicular rocks, in the crevices and fissures of which may be found numerous species of invertebrate animals. At other places the shore slants more or less gradually, leaving broad areas of rock gravel, sand or mud, with animals adapted to every condition. Where the laboratory stood, on the east side of 'the point,' facing Malloch's weir, the lowest tides receded nearly 400 yards. With the rising tide strong currents are swept inwards, between the islands, carrying hosts of marine animals. When the tide falls again numbers of these are left stranded on the beach, or confined in small pools easily accessible to the collector. Approaching the large rivers that empty into the bay one finds other conditions, varying from saline through brackish to fresh water. Turn what way he will, an observer is likely to come upon the common star-fish in many colour-varieties, the sea-urchin and the sea-cucumber, among echinoderms. The mollusca are abundantly represented by the edible mussel, the horse-mussel and the clam, long and round whelks, the purple shell, the periwinkle, and the limpet. Nereis, Arenicola, Nephthys, Rhynchobolus, Lepidonotus, Amphitrite, and Lineus are common representative of the worms; while crabs, hermit crabs, barnacles and sand-hoppers are the commonest types of crustacea. A good many hydroids, polyzoa, and sponges may also be easily procured along shore.

The best collecting places are reached at the period of lowest tides that occur only at the beginning and in the middle of each month. At such times one can wade into the water on the southwest side of the outermost limits of 'the point,' near St. Andrew's, and at arm's depth feel under the projecting ledges or turn over flat stones that are never left uncovered and are not accessible at other periods. This is probably the best place on the coast for sea-peaches (*Cynthia pyri formis*), but many other animals such as Nudibranchs and Sunstars (*Solaster*) occur. In fine sand at about half-tide mark just south of 'the bar' by Malloch's weir, I dug up the only specimens of *Balanoglossus* and of *Edwardsia* yet procured at the station. The north side and outer end of this bar are also good collecting places, where the sea-orange (*Psolus Fabricii*) may be picked by hand. The entrance to Katy's Cove

6-7 EDWARD VII., A. 1907

furnishes numerous forms, among which may be mentioned Chirodota, under the mussel beds to the left of the railway bridge; and farther inwards, around the remains of a former dam, are large-sized limpets and tube-worms. Craig's Ledges, on the upper side of the entrance to Chamcook harbour, are resorts rich in sea-anemones, brittle-stars, &c., as are also tide-pools near the outer, rocky end of Pendleton's island. In one of these, small enough to be jumped over and deep as one's waist, supported by a big rock on the side towards the water, and situated at about half-tide mark, during two successive summers, a great collection of animals appeared, comprising many species, among which may be mentioned a brachiopod (*Terebratulina*) which is usually procured only by dredging, and a tube-worm (*Amphitrite*). Nearby in fine sand occurs a species of *Enchytræus*. The 'western block' on the bar between St. Andrew's and the island, and other places, were frequently visited and might be mentioned, but this must suffice.

The dredge was used in the St. Croix river above Dochet Island, between Joe's point and Robbin's Town, off all sides of St. Andrew's Island, up the bay towards the mouths of the Bocabec, Digdequash and Magaguadavic rivers, and once we went as far east as L'Etang and dredged scallops, landing on Frye's island at low water when returning. Opposite where the station stood we dredged at many places round the lighthouse (Sand Reef Light) and off McMaster's, Pendleton's and Deer islands. We also dredged off Pleasant point, and once went as far south as Eastport, Campobello island, and Lubec Narrows. This last is a rich and interesting region, and it is to be regretted that the staff were unable to examine it thoroughly as well as to visit Grand Manan.

The fisheries of economic importance at St. Andrew's are chiefly cod, haddock, pollock, herring, mackerel, and clams and lobsters.

At Canso the tidal water rises and falls only about 4 feet, affecting but a narrow belt of the shore. There are few accessible rich collecting spots, the coast being generally rocky with here and there small beaches of rounded stones, but seldom gravel, sand or mud. Wherever stones large enough for protection to animals and small enough to be moved by the collector do occur there is intolerably rough water producing friction fatal to delicate animal forms. At such places the stones, worn round and smooth by constant rolling and grinding, are heaped in enormous masses, while at other places they are laid out like pavement stones and solidly cemented into the beach.

At low water mark the star fishes and sea-urchins, which are a feature of the St. Andrew's region do not appear; these, however, may be found in limited numbers under wharfs or at places up the centre of Tickle channel; but sea-cucumbers, that at St. Andrew's may be found clinging to the ledges or arranged by the score in beds below the lowest tide limits, are scarcely ever seen at Canso; only two or three that were brought from deep water were secured. Sea anemones flourish under the wharfs and especially at French Point, where large brown, gray, yellow and orange *Metridia* occur side by side in the fissures of rocks. At this point too the horse-mussel and the edible mussel occur, but the latter may be obtained abundantly at the 'breakwater' (Grave Island). Clams are scarce, but may be found, together with a few razor shells (*Solen*), at Grassy Island and Publicover Beach. The large round whelk may be procured at Indian Cove, and the long whelk, together with the purple shell, the periwinkle, and little limpets, in small numbers at Glasgow Head. Various Nudibranchs live on the sea-weeds under certain wharfs, and fine specimens of *Æolis papillosa* under stones in the narrow channel between Piscatiqui and George Islands. Calcareous sponges, hydroids, and bryozoa occur on the submerged timbers of wharfs or on the sea-weeds to be found there or especially at Cranberry Islands. Arenicola, Nereis, Nephthys and other worms may be dug up from Llanigan Beach, where the laboratory stood, and in Grassy Island Cove and Publicover Beach. The sessile barnacle, the sand shrimp and the crab are the chief crustaceans, but lobsters, so plentiful in deep water among the islands, may be occasionally seen lurking under the edges of rocks along shore.

Dredgings were made at various places in Chedabucto Bay, e.g., at Crow Harbour, on Hydra Shoal, across the entrance to the Gut of Canso, and from that eastward be-

SESSIONAL PAPER No. 22a

tween Canso and Isle Madame as far as to Green Island. Near Canso, areas were dredged from Tickle Island to the eastward, encircling Derabie Islands and Cranberry Islands, to Cape Canso, and at many places in the harbours and between the islands.

Professor Prince, Professor Ramsay Wright, and others had the opportunity of being on the Mackay-Bennett cable-repairing steamer, and I had the advantage of remaining on board for a couple of days in Dover Bay and saw what animals were brought up on the cables as they were raised.

The most successful places dredged during the two seasons were to the north-east of Tickle Island and Durell Island, and outward from the bell-buoy in a line with the channel entering Canso Harbour from the west. Here occur calcareous and other sponges, a couple of species of sea-orange (*Psolus*), Myriotrochus, Eupyrgus, and one or two commoner Holothurians. Mussel shells dredged at the entrance to Grassy Island Cove have Crepidulas attached.

Although Canso is not a point exceptionally favourable from which to collect invertebrates in numbers, yet, in one way or another, specimens were procured of most of the species obtained at St. Andrew's, besides a few others. Its proximity to some of the best fishing banks in the world is sufficient proof that there exist somewhere in the adjacent waters vast quantities of smaller animals upon which the fishes feed. The most valuable of these fisheries, as is well known, are the cod, haddock, pollock, mackerel, salmon, halibut, the lobster, and the squid.

As the member of the staff charged largely with the collection of specimens and their storage for purposes of study, &c., a vast amount of the material obtained since the station was founded has passed through my hands. In spite of an inadequate supply of literature necessary for accurate determination of species, I have been able to prepare a list, which when finally revised will be a basis for future work. I shall give here a list of the Porifera, the Cœlenterata with the exception of the smaller hydroids, and the Echinodermata, and propose in further papers to add to the present contribution, after the specimens have been more completely worked over, and others collected from more northerly areas.

IV.

A FURTHER REPORT UPON THE EFFECTS OF SAWDUST ON FISH LIFE.

By PROFESSOR A. P. KNIGHT, M.A., M.D., &C., QUEEN'S UNIVERSITY, KINGSTON.

The following investigation was begun in the year 1900, at the suggestion of Professor Prince, the fish commissioner for the Dominion of Canada. In the previous year Professor Prince had summarized in a most admirable way the effects of different kinds of pollutions upon fish; and, in order to do this, had consulted a great mass of scientific literature emanating from investigators in both Europe and America. One of the things which struck him as most remarkable was 'the painful lack of scientific demonstrated knowledge as regards the effects of sawdust upon fish life.' The onerous and exacting duties of his office precluded him from undertaking any lengthened series of scientific experiments himself. But from the very start of research work at the Dominion Biological Station he impressed upon the workers the importance of certain fisheries problems which he desired to have solved. Among these was the sawdust question.

Up to 1899, when Professor Prince wrote the report alluded to above, he had ample opportunities, during the course of his official visits to different parts of Canada, of making observations upon sawdust-polluted streams, and as a result of these observations he reached the conclusion that, 'so far as our present knowledge goes, sawdust pollution, if it does not affect the upper waters, the shallow spawning grounds, appears to do little harm to the adult fish in their passage up from the sea. . . . There is no case on record of salmon, or shad, or any other healthy adult fish being found choked with sawdust, or in any way fatally injured by the floating particles.'

The Dominion law was, however, against Professor Prince's views on the matter, and in 1901, the Ontario Fisheries Department proceeded to enforce the Dominion Act. Three mill-owners were fined for passing sawdust and shavings into streams containing protected fish, and many others were warned.

The Deputy Fish Commissioner for Ontario, Mr. S. T. Bastedo, held views the very opposite of these expressed by Professor Prince. In his annual report for 1899, Mr. Bastedo says: 'There can be nothing more destructive of fish life than the depositing of sawdust in the rivers and lakes.'

When two experts hold views so diametrically opposed as those of Professor Prince and Mr. Bastedo, the average member of parliament may well be excused from holding any views at all upon the subject; and yet he is forced to take some stand on the subject of prohibitive legislation? There has been a law against throwing mill refuse into the rivers of Canada ever since 1860. Certain streams were exempted from the operation of that law right down to 1899. The practical question, therefore, now facing the fish commissioners in the various provinces is this: 'Shall the law be enforced?'

Evidently the whole subject should be reported upon by disinterested investigators, and the law should be neither repealed nor enforced until their judgment is received.

The literature of the subject helps us very little. Previously to 1888 there were frequent references to it in the annual reports and bulletins of the United States Fish Commission; but the experts were by no means unanimous in their judgments, as is evident from the following editorial published in *Forest and Stream* in 1899:—

'The effect of sawdust in lakes and streams has been discussed by many writers and with conflicting opinions.

In the second part of the Report of the United States Commissioner of Fish and Fisheries, 1872-73, Mr. James W. Milner gives the result of his observations on the great lakes. Speaking of Green bay, he says that whitefish were formerly taken in abundance in the spawning season in a number of rivers emptying into this bay; but sawmills are numerous at present on all of these streams, and the great amount of sawdust in the rivers has caused the whitefish to leave them. The effect of the sawdust, he states, is to cover up the spawning grounds and destroy the food of the fish. Watson, in the third part of the same report, charges the sawdust with the destruction of the purity and aerated condition of the water, so changing its character as to revolt the cleanly habits of the salmon. He mentions the experience of Mr. Arnold, who had seen the gills of salmon filled with sawdust. Mr. Mather, in Transactions American Fishcultural Association, 1882, and in these columns of the same year, thinks that sawdust is destructive to the young by covering up the spawning grounds, and by polluting the water with turpentine from the pine and tannin from oak.

Mr. J. J. Brown, of Ludington, Mich., in Bulletin V., United States Fish Commission, charges the sawdust and shingle shavings dumped into Lake Michigan with the annihilation of the feeding grounds of fish. The statements of 'Sportsman' and Livingston Stone in recent numbers of this paper, are very positive as to the deleterious influence of sawdust in polluting the water, killing the young and promoting the growth of fungus. Mr. Stone believes that after the spawning grounds are covered with sawdust the stream can produce no more trout.

Charles G. Atkins, in Part II., Report of United States Fish Commission, speaks of the Penobscot river. He finds that sawdust has interfered with the success of certain fishing stations, but the salmon are not prevented from ascending to their spawning beds, which are free from obstruction and seem to suffer no injury from the refuse.

Professor H. Rasch, an eminent authority in Norway, communicated his views on the sawdust question to the Norwegian Hunting and Fishing Association in 1873. He admits that rivers on which there is considerable cutting of timber gradually become more and more destitute of salmon, but thinks that the injury is not to the fish directly, but is caused by limiting and partially destroying the spawning grounds. He cites the River Drammen, which was greatly polluted by sawdust for many years, and in which the salmon decreased constantly, until the fishermen at Hellefos begun hatching them artificially and planting the fry annually. Having access to the upper part of the river, which was comparatively free from sawdust, the ascending fish seemed to be little affected by the mill refuse from below Hellefos. His opinion, based upon experience on the Drammen river and the Soli, was that unless the salmon are prevented by impassible dams from ascending above the mill locations, the sawdust will not drive them from the streams nor materially injure them. *Piscator*, Charles Hallock, and Milton D. Peirce have produced statistics and observations to prove that sawdust in streams of Nova Scotia and Massachusetts has not injured the fishing for trout, and has not unfavourably affected any of the river fisheries.

From the foregoing survey it will be evident that there are two sides to the question as to the influence of sawdust in streams and lakes, and it may be possible that some of the states which have legislated against the deposit of this substance in certain waters have placed unnecessary restrictions upon an important industry. Unless spawning grounds are actually covered and feeding grounds destroyed, there would seem to be no case against the sawdust. At all events, the instigators of this legislation should produce evidence of deleterious effects to be remedied by legal enactments, and show that such pollution is necessarily and always fatal, and cannot be mitigated by measures to aid the ascent to the spawning beds.'

Since 1889 the references to sawdust are 'few and far between,' and when its poisonous effects are asserted, the responsibility for the statements is placed upon fishermen or fish dealers. Even the international commissioners of 1893 made no

SESSIONAL PAPER No. 22a

dogmatic statements of their own, but simply submitted the statements of witnesses whom they had examined.

The experimental part of my work was begun at the Dominion Biological station, St. Andrews, N.B., in 1900, and has been continued since then in the biological laboratory of Queen's University, Kingston, Ontario. The river work consisted of a few weeks' study of the Bonnechere, a tributary of the Ottawa.

Those who are interested in the details of my experimental work are referred to the Transactions of the Canadian Institute, Vol. VII., 1903, under the article 'Sawdust and Fish Life.'

SINKING OF SAWDUST.

Numerous observations were made upon the sinking of sawdust. The general method of experimentation was to add known volumes of sawdust from different kinds of wood to separate vessels containing a measured volume of water. The sawdust was generally dropped quietly upon the top of the water. As a rule, the particles of sawdust began to sink the moment the sawdust touched the water. This was particularly true if the particles were fine; but there were considerable variations in the rapidity with which sinking occurred. So far as could be determined by laboratory experiments, the rate of sinking varied with (a) the size of the dust particles, (b) the way in which they were made, (c) the motion of the water, (d) the dryness of the dust, and (e) the kind of wood.

Large particles sink more slowly than small ones, because the latter are more easily penetrated by the water.

Large saws which strike logs with great force (as in a sawmill) compress the wood, drive out the air imprisoned in the cells, and produce sawdust that sinks quickly.

Sawdust sinks slowly in perfectly calm water, such as a standing vessel. If the vessel be tapped gently on the side, the sawdust sinks much more quickly.

If thrown into rapidly flowing stream, sawdust is carried downwards until it reaches pools, eddies, or comparatively calm stretches; it then sinks and forms sawdust beds. Some of these are of great extent along the Ottawa river.

Sawdust from different kinds of wood arranged themselves in the following order as regards rate of sinking.—

1. Oak.
2. White pine, 50 to 80 per cent of it in 2 or 3 minutes.
3. Maple.
4. Cedar.
5. Elm.

But it must be remembered that the particles in my experiments differed from each other in size and in the moisture they contained, and consequently different results might easily be obtained by other observers. The important point is that all kinds of sawdust sank in a few minutes in agitated water.

EXTRACTS FROM SAWDUST.

When sawdust was placed in a clean bag, and the bag sunk to the bottom of an aquarium by means of stones, there oozed out of the sawdust a yellowish, brown liquid which lay along the bottom of the vessel. (See fig. 1). In a number of experiments this brownish water occupied $1\frac{3}{4}$ inches at the bottom of an aquarium containing water to a depth of $16\frac{1}{2}$ inches. The overlying water remained clear and colourless for several days when pine sawdust was used. In the case of cedar, the aqueous extract diffused upwards into the clear water, but never rendered it so dark as that which lay at the bottom. When the brown water was siphoned out, the sawdust soon discoloured more of the clear water. Evidently the water was dissolving out from the

sawdust some soluble material which was stored in the wood. This yellowish brown solution was found to be exceedingly poisonous to fish eggs, fry, living organisms suitable for fish-food and adult fish.

Fig. 1.

SOURCE OF POISON.

In order to understand the source of this poison we must try to get a clear idea of the minute structure of trees. This can be done only by the aid of the microscope. With this instrument, it is easy to see that all parts of young plants are made up of a vast number of very small bladder-like compartments called cells. In older plants and trees, these cells lengthen out and are then called vessels. It is important to note that every cell or vessel consists of two principal parts, (a) the outside covering or cell wall, and (b) the inside matter or cell contents. If one were to imagine the cells in the comb of a honey bee shrinking into such a small size that each one would be almost invisible, then a very good idea would be obtained of the minute structure of a tree. The wax would correspond to the walls of the cells composing a tree, and the inclosed honey would correspond to the cell contents.

In aquatic plants, like pond silk, the cells are cylindrical and placed end to end, so as to form the long slender threads. In flat leaves the cells are arranged side by side in two or more layers, so as to form the flat surface; in stems they are packed side by side and end to end. Thus, trunk, branches, bark, roots, flowers and fruit are all made up of these cells. In different plants they differ vastly in shape, size, thickness of walls and contents. Bacteria are plants consisting of single cells; pines are composed of millions of cells. In all plants also, the protoplasm, which is the central, living, moving, sensitive part of the cell, manufactures different substances, and either packs these in the cell as reserve material, which is the case in the higher plants, or throws them out of the cell altogether as dead waste, which is the case in many of the bacteria.

In order, therefore, to find out more definitely, if possible, the source of the poisons given off by sawdust, we must look more closely at the contents of wood cells.

CELL CONTENTS.

Young cells are filled at first with protoplasm only. As time goes on, sap forms in the cell and accumulates as small drops in the protoplasm. The sap consists of water and nutritive material dissolved in the water. These two stages in cell life are represented in Figures 2 and 3. Somewhat later, other substances which have been formed by the activity of the protoplasm are stored in the cell, along with the protoplasm and cell sap. Among the commonest materials thus stored in cells are sugar, starch, oils, such as olive, castor, linseed and palm oil; resins, gums, jellies, alkaloids, pigments, acids, such as malic, citric, tartaric and tannic, essential oils such as turpentine.

In the pine family there is stored in the wood and bark cells an abundance of crude turpentine and resin. The Norway spruce of Europe furnishes, from cells, turpentine and Burgundy pitch. The yellow pine of the southern United States yields

SESSIONAL PAPER No. 22a

spirits of turpentine by distillation of the crude turpentine which runs away from the trees when they are tapped. The residue after the distillation is known as resin.

Fig. 2.—Very young cells without cell-sap.

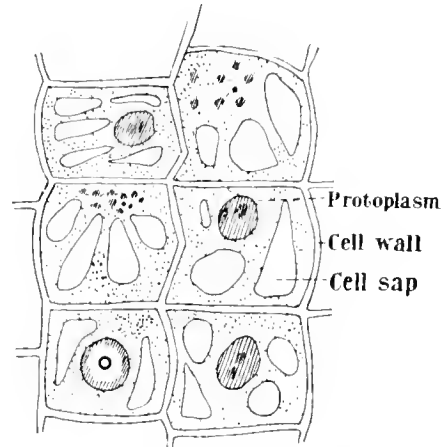

Fig. 3.—Cells showing cell-wall; protoplasmic contents with cell-sap.

Now the source of the poison in the yellowish brown water is unquestionably the material stored in the wood cells. As each cell or vessel is microscopic and contains only a very small quantity of poisonous material, and as the cell wall must be broken open in order to let out the cell contents, it follows that the greater the number of cells that are opened, the greater will be the quantity of turpentine, tanin, &c., poured out. Hence a saw-log completely converted into sawdust would give out the maximum of poison, whereas a similar log sawn into boards, slabs and edgings would give out a much less quantity. Pulp mills will give out the maximum of stored material. So will beet-sugar factories.

The total waste in manufacturing saw-logs into inch boards varies from 25 per cent to 35 per cent of the whole log. Of this total waste, about 13 per cent is sawdust. The proportion of refuse varies (1) with the size of the logs, (2) with the kind of lumber into which the logs are sawn, and (3) with the width of the cut made by the saw.

PULP MILL POISON.

My St. Andrew's experiments determined the percentage of poison from a sulphite pulp mill which is fatal to fish life, but so far as I know, the percentage of poison from a mechanical mill has never been determined. A provisional conclusion, however, may be fairly based upon some of my experiments to be described later in this paper.

QUANTITATIVE DETERMINATIONS.

A quantitative determination of the solid matter contained in the yellowish brown water was made by evaporating 1,000 c.c. of it, at 100° C., in a platinum crucible, and then weighing the rest.

The following results were obtained from white pine solution:—

	M.gs.
1. Solid matter from 1000 c.c. water, the sawdust soaking for four days.	1160
2. Same sawdust with the first water filtered off, and fresh water added and allowed to stand for five days. Solid..	260

CEDAR SAWDUST.

1. Solid matter from 1000 c.c. water, the cedar sawdust soaking for four days.	1220
2. Same sawdust with first water filtered off, fresh water added and allowed to stand five days.	470
3. Same operation repeated. Soaking five days	270

These determinations indicate clearly enough that the stored material in wood cells comes away in diminishing quantity every time fresh water is added to sawdust.

WHITE PINE.

A long series of experiments were made with water obtained by soaking 360 grams of white pine sawdust in 7000 c.c. of tap water and changing the water at irregular intervals. During a period of three weeks the water was changed twenty times. In 1,000 c.c. of the twentieth solution, there was found to be 80 m.gs. of solid matter dissolved out of the pine cells. During every day almost of the three weeks, the effects of the poisonous water were tested by immersing fish eggs, adult perch, aquatic worms, tadpoles, copepods, daphnia, hydra, vorticella and black bass fry in the water, and in every instance death followed sooner or later. Sometimes death took place in a few minutes, sometimes in a few hours, the result depending upon the strength of the solution. When air was made to bubble through the poisoned water, the animal lived somewhat longer.

CEDAR SAWDUST.

A similar series of experiments were carried out with cedar sawdust. In this case, 400 grams of sawdust were soaked in 7000 c.c. of tap water. The water was changed 30 times during a period of five weeks, and a 1000 c.c. of the last solution of it—were found to contain 155 m.gs. of solid matter. The water was tested almost daily by immersing animals in it, just as in the case of pine extracts. The cedar water was found to maintain its poisonous character for a longer time than pine. In other words, cedar wood cells contain more poisonous matter than pine wood cells.

EXTRACTS QUICKLY SOLUBLE.

The experiments hitherto described would seem to indicate that some considerable time was required for the water to dissolve out the poisonous extracts from white pine sawdust, but such is certainly not the case. This was clearly shown in the following experiment, Fig. 4. Two minnows were confined in a bottle containing 600 c.c. water and eighteen grams of white pine sawdust. Fresh water was made to enter and leave at the rate of 100 c.c. per minute. The inlet tube passed straight to the bottom of the vessel, and its lower end was therefore buried in about an inch of sawdust. One animal lived forty minutes, the other fifty. When the incoming water was reduced to 80 c.c. per minute three minnows lived only from three to five minutes. When the fresh water entered at the rate of 125 c.c. per minute, minnows lived from twenty to ninety minutes. The control animals were kept for a week in a similar bottle, without sawdust, of course, and with water coming in at the rate of 110 c.c. per minute. In these experiments the poisonous extracts must have been coming away all the time. The moment the bottle was full of water the minnows were slipped into it. Consequently, when the fish were killed in five minutes, the 600 c.c. at first in the bottle, and 400 c.c. additional water were poisoned. When they were killed in ninety minutes, no less than 11,250 c.c. were poisoned. That is, the percentage weight of sawdust to poisoned water was .16 per cent. This determination is important, as we shall see later, when we come to compare it with the percentage of sawdust thrown into the Bonnechere river.

Fig. 4.

COMPARATIVE RESULTS.

After obtaining the general results indicated in the preceding part of this paper, it seemed desirable to plan a series of experiments that would show comparative results

SESSIONAL PAPER No. 22a

at a glance. With this end in view, two grams each of different kinds of sawdust were placed in shallow circular dishes containing respectively, 300, 400, 500, 600, 700, 800, 900, 1,000, 1,200, 1,500 and 1,700 c.c. of fresh water. After soaking for about five hours in each case, a minnow was placed in each of the dishes. The length of time each animal lived was carefully noted, except in those cases where death occurred during the night. The results are given in the following tables:—

WHITE PINE SAWDUST.

Weight of Sawdust.	Volume Water c. c.	Time Soaking.	Time at which minnow was immersed.	Results.
2 grams.	300	From 10 a.m.	2.43 p.m.	Lived about 9 minutes.

BARK EXTRACTS.

Contrary to opinions expressed in some reports upon sawdust pollution, I found that aqueous extracts from bark of white pine, hemlock and cedar were not nearly so poisonous as the sawdust solutions. The tannin or other material dissolved out from hemlock bark was of course poisonous; but, in a general way, the effect of bark solutions upon adult fish was to kill them by suffocation. The oxidation processes going on in the bark extracts deprived the water of the oxygen usually dissolved in it, and as a consequence fish immersed in it soon died. That this was the true cause of death was evident from the fact that bark solution when aerated, that is, with air made to bubble through it, supported fish life just as well as any normal water would do.

BLACK BASS FRY.

For the successful results obtained in many of my experiments I am indebted to the Department of Marine and Fisheries, Ottawa. On June 27, Mr. Halkett, an officer of the department, brought to me about 100 black bass fry. They had been hatched out in the natural pond at Belleville and were a fine lot of fry, each about an inch long. I placed them in a galvanized-iron tank about 4 feet long, 3 feet wide, the water in it being kept about 3 to 4 inches deep. A copious flow of tap water from Lake Ontario

SESSIONAL PAPER No. 22a

entered the tank and left it continually. A few flat stones were placed here and there on the bottom.

The larger and more pugnacious ones took shelter beneath the stones, the smaller and more timid ones were forced into the corners of the tank, driven away from the stones by their bigger neighbours. I fed them regularly on small and well washed particles of meat, obtained by mincing small earthworms. These fine particles were flipped into the water. As they slowly sank towards the bottom they were seized by the fry and eaten with great avidity. The tank was always clean, and I had no trouble in keeping the fry alive and healthy.

In catching them for the experiments, I used a dip net. The slower ones were, of course, caught first. At the end of three weeks the survivors had become so expert in dodging the net that they were very difficult to capture. They had grown to about $1\frac{1}{2}$ inches in length and correspondingly heavy. The last few could be caught only by drawing the water off from the tank.

CONTROL EXPERIMENTS.

The general method of conducting the experiments has been already indicated. It consisted in immersing fish eggs, fry, fish food (such as aquatic larvae, worms, tadpoles) and adult fish, in varying strengths of sawdust solutions and noting results. In the vast majority of cases a control animal in tap water accompanied the regular experiment, and observations were made upon both at the same time. Hundreds of small minnows were used as well as the black bass fry already referred to. In some experiments the minnows appeared to be the more robust, in other cases the fry.

CRITICISMS.

In some newspaper criticisms of my work at St. Andrews in 1900, objection was made to the statement that sawdust poisoned the water. The writers held that there was no poison in sawdust, and that it killed fish solely by taking out the oxygen dissolved in the water. They asserted that fish eggs and all forms of fish life were killed by suffocation. To test this statement I took some of the yellowish brown sawdust water and made a large quantity of air to bubble through it. When the air was thus passing through the solution I frequently placed fish eggs, and adult fish in this aerated water, but in every instance eggs and fish alike died. They died, therefore, not from suffocation, but from the effects of the poison passing from the water through their gill filaments, and into their blood. When not kept too long in the extract the fish could generally be resuscitated by placing them in fresh water.

DECAYING SAWDUST.

One objection frequently urged against the practice of throwing sawdust into streams and rivers is that the decaying sawdust imparts such a disagreeable odour to the water that sensitive fish are driven away to other waters not so polluted. It seemed to me, therefore, that some progress might be made towards a definite conclusion in this matter, if sawdust were allowed to stand for several weeks in an aquarium and tested from time to time as to the changes going on in it, and the influence of these upon fish.

With this end in view about 1,000 grams of white pine sawdust were placed in an aquarium three feet four inches long, fifteen inches wide, and filled up to sixteen and a half inches deep with fresh water. This was done June 24. No water was allowed to enter or leave the vessel. No direct sunlight fell upon it.

The usual results followed, viz., a well defined layer of pale, yellow water about three-quarter of an inch deep formed in a few hours and lay at the bottom. On top of this was the perfectly clear layer about fifteen inches deep.

After soaking for two days, bubbles of gas began to rise to the surface of the water, but no attempt was made to analyze it. The bottom yellowish layer had become so dense that no object could be seen across it—a thickness of fifteen inches. Its upper surface was sharply marked off from the overlying transparent water by a thin grayish layer. Microscopic examination of this layer showed it to be swarming with bacteria.

For the information of the general reader it may be explained that bacteria are divided into two classes in relation to oxygen. One class can live only when in contact with air (oxygen). These are known as *aerobic* bacteria. The other class can live only in media from which air (oxygen) is excluded. These are known as *anaerobic* bacteria. The anaerobic were present at the bottom of the aquarium, the aerobic, chiefly towards the top. But between these two, were to be found other bacteria which could live and multiply either in the presence or absence of oxygen.

At the end of the week, the water, especially that siphoned off from the bottom, emitted a sweetish aromatic smell. Only about an inch at the bottom had retained the original yellow colour; the next inch had changed to a yellowish brown; then came a grayish layer about one-sixteenth of an inch thick; above this, what had at first been fourteen inches of perfectly clear water had turned to a dark gray, though still quite transparent. Black bass fry placed in the aquarium at this time at first darted to the bottom, but after meeting the poisonous extract once or twice could not subsequently be driven into it. On the contrary they swam along the top with their nose just touching the surface of the water, and behaved as if suffering from lack of air. They lived only about two hours.

Four days after this, black bass fry lived only an hour when placed in the upper 14 inches of water. That they were suffocating was proved by the fact that, on aerating the water, the fry lived in it for 24 hours, and were then apparently well.

In three weeks the upper 14 inches of water had changed to a steel gray colour.

In five weeks the pleasant aromatic odour had given place to a musty disagreeable smell. The laboratory windows being open, mosquito larvæ became numerous in the aquarium and appeared to be feeding upon the bacteria which were very abundant on the surface of the bag, and along the sides of the aquarium.

On July 31, some of the water was siphoned off from the middle of the aquarium and placed outside the laboratory in direct sunlight. Dr. W. T. Connell, Professor of Bacteriology in the University, examined this water on three successive occasions, and compared its bacterial life with that in the aquarium. He found that sunlight and air had killed off those kinds of bacteria which flourish in shade and in absence of oxygen, and stimulated the growth of other kinds of bacteria which flourish in sunshine and moving water. In a fortnight, this water had become odourless, transparent and brownish in colour. Minnows were able to live in it, and soon played havoc with the mosquito larvæ.

The water in the aquarium remained slate-coloured, slimy and foul-smelling for two months longer, when it was thrown out.

SAWDUST BEDS.

No one needs to be told that sawdust undergoing decay in the laboratory and sawdust decaying along the beds of rivers and streams must present different phenomena. In the laboratory experiment, the sawdust is always under water, the water is stagnant, and both sawdust and water are in the shade. Along a stream, sawdust beds are, in spring and early summer, formed under water; late in the season, they are frequently exposed high and dry to the influences of sunshine, shade and wind. Only in shady pools remaining after the spring freshets, could the conditions in decaying sawdust approximate to those in my laboratory experiment. Moreover, there is continually passing over all sawdust beds a slow current of water, which profoundly influences the changes going on in decomposing matter. The running water is slowly and surely extracting the soluble organic matter from the wood cells. Day after day

SESSIONAL PAPER No. 22a

it is withdrawing the poisonous material, so that it is only a question of time, until every particle of poison is withdrawn from the sawdust. In the course of a few seasons at most, nothing can remain, but the perfectly harmless wood fibre.

If my laboratory experiment proves anything, it suggests that bacteria will multiply enormously in old sawdust beds, and will consequently stimulate the multiplication of insect life. If this surmise is correct, it throws light upon a fact which is well known to anglers, viz., that the vicinity of old sawdust beds is a favourite haunt for trout and black bass. Beds composed of freshly made sawdust will drive fish away; but old beds, those which have been leached of their poison, will attract fish, because the sawdust shelters and feeds the larvæ of aquatic insects upon which many fish subsist.

Many anglers could corroborate the following testimony of a writer in *Forest and Stream* :—

‘ Obviously, in localities where the entire bottom is embedded by sawdust, fish can neither spawn nor feed; but it happens that such deposits do not form on their breeding places, nor is the area of their foraging ground appreciably diminished by their presence. Even in the half-emptied and now useless ponds, the current constantly scours out a central channel through the sawdust, leaving the bottom clear and pebbly; so that, in fact, these local beds are of no more detriment to the fish than so many submerged logs. The trout can range far and wide without encountering them at all. Yet, strange to say—that is, it must seem strange to those persons who take it for granted that sawdust kills fish—the most likely places for the larger trout are these self-same pebbly channels in the old ponds, along whose edges, despite a hundred freshets and ice-shoves, the persistent sawdust and tanbark lie in wind-rows so deep that the wader feels as if he were going to sink out of sight whenever he puts his foot into the yielding mass, every movement of which stirs up a broadening efflorescence which spreads for rods away, distributing itself throughout the stream.’

NUTRITIVE RELATIONS.

The connection between a few links in the chain of animal life was apparent enough in the decaying sawdust. Wood extracts supported bacteria, bacteria supported mosquito larvæ, and these again supported fish life. A similar relationship exists in nature. Leaves, branches, and trunks of dead trees are decomposing continuously in our forests. Their cell contents are dissolved out by rain and melting snow, and are in part carried away in streams and rivers. Bacterial life is abundant in all woodland streams, and must be important as food for aquatic insects. With the disappearance of our forests, the bacterial life of streams and rivers must change completely in character, and so must the insect life found along their course. And if the insect life dwindles or disappears, so must the fish life which subsists directly or indirectly upon it. But the great destroyer of fish life is man.

INFLUENCE OF MAN.

The Anglo-Saxon has always been a disturbing factor in the balance of life. Forests, game and fish all disappear with his arrival. To get good fishing or good hunting now-a-days one must travel back to unsettled districts. No one expects game to be plentiful along the settled shores of Lake Ontario, but many people are amazed that fish are not abundant in it. They still hug the pleasing delusion that if brooks have been overfished the fish hatchery can restock them. But with the disappearance of our forests it is exceedingly doubtful whether we can ever again, by all the help of hatcheries, overseers and fish commissioners, re-people the streams which have been depleted by man through deforestation and over-fishing. He has upset the balance of life; it can only be fully restored by a return to primitive conditions. When game, therefore, becomes plentiful on the streets of Ottawa city, fish will be equally abundant below the saw-mills of the Chaudière falls. The conditions are almost if not quite parallel.

ON THE BONNECHÈRE RIVER.

A final judgment cannot at present be pronounced upon the poisonous effects of sawdust. These effects must be studied near the mills and along the sawdust beds of various rivers. A three weeks' study of the Bonnechère river, a tributary of the Ottawa, much polluted with mill rubbish, led me to modify very considerably the conclusions which I had based upon my laboratory experiments. I visited the mill represented in two of the illustrations of this report fully expecting that not one fish could survive in such surroundings. But pike were abundant for miles below the mill, and fish (chub) could be caught any day along the side of the submerged driftwood. Stranger still, the fish so caught lived for three hours in a pailful of sawdust water drawn from the very centre of a sawdust bed. A few brook trout had been caught earlier in the season just below the mill when it was running. At the date of my visit, August 20, 1902, the mill had been closed for seven weeks and no sawdust was then passing into the river.

The owner of the mill furnished me with the data necessary to calculate the percentage of sawdust in the water passing his mill every twenty-four hours. The water contained .004 per cent of sawdust by weight.

Fig. 5.—Sawmill on the Bonnechère River, a branch of the Ottawa. Sawdust and edgings pass into the river from the end of the mill.

Comparing this percentage with that in two of the laboratory experiments described on pages 42 and 43, we find that in one case two grams of white pine sawdust in 1,700 c.c. of fresh water, *i.e.*, .12 per cent strength, soaking for five hours, killed a minnow in twenty-nine minutes; and in the other case a percentage of .16 killed in ninety minutes. That is, there was forty times more water in proportion to sawdust in the Bonnechère river than in one of my laboratory experiments in which a minnow lived for ninety minutes.

The strength of a cup of tea depends upon the proportion of tea leaves to water. And in the same way, the extent to which any stream is polluted with sawdust depends mainly upon two things, *viz.*, (1) the quantity of sawdust, and (2) the volume of water into which the sawdust is discharged. No stream, therefore, can be pronounced off-

SESSIONAL PAPER No. 22a

hand as poisoned by sawdust. Each stream must be studied by itself, and the varying conditions must be understood before a judgment can be pronounced.

Of course, the percentage of sawdust in the Bonnehère is a mere approximation, but it points unmistakably to the conclusion that the sawdust poured into the Bonnehère river is not destroying its fish life. Moreover, in Golden lake, an expansion of this same river, and ten miles above any saw-mill, lake trout used to be very abundant. Every October large numbers were caught in nets along their spawning beds. Now these spawning grounds are reported to be deserted by the fish, and certainly sawdust

Fig. 6.—Slabs, edgings and sawdust, half-a-mile below the mill.

cannot be blamed for their disappearance. Higher up the river, in Round lake, the October fishing is still good, solely because there are fewer settlers and less fishing.

ON THE OTONABEE RIVER.

R. M. Dennistoun, Esq., K.C., of Peterborough, has finished the following interesting account of his observations on the Otonabee river:—

‘When I was a boy I fished continuously in the river and caught small perches, chub, suckers, &c. A few years later no fish were caught in the river at all, and there were great beds of sawdust in all the slack water. About the year 1893, the Dominion Government absolutely prohibited the placing of sawdust in the river. At this time the little lake at Peterborough was a horrible place. The sawdust lay upon the bottom to the depth of 8 or 10 feet in some places, and the gases which were generated would suddenly burst upwards with such force as to render canoeing unpleasant and even dangerous. It took several years, after the placing of the sawdust in the river had been stopped, to wash out the accumulated deposits, but successive spring freshets accomplished this.

In a very few years we began to notice that small fish were returning; then came the large fish, and now we have excellent fishing for bass, in all parts of the river, right through the centre of the town of Peterborough. We have good maskinonge fishing in the little lake which is adjacent to the town, and which was formerly nearly filled with sawdust. I can now go down on a June morning to the river just below my house, and cast a fly with invariable success, and no amount of theory or argu-

6-7 EDWARD VII., A. 1907

ment would shake my knowledge of the fact that this is due entirely to the removal of the sawdust from the river. There are now several fishing clubs in Peterborough. The Peterborough Lock Company and the Canadian General Electric Company each has a fishing club composed of workmen from the factories. This will satisfy you that the fishing is now worth something.'

The conditions which Mr. Dennistown describes are quite different from those on the Bonnechere. On this river, below where I made my observations, there is a fairly rapid current for 5 or 8 miles, and no slack water or pools excepting at the Douglas dam. The rapid current aerates the water, promotes microbic action upon the wood extracts, and tends to self-purification, whereas on the Otonabee river, the conditions would approximate to those of decaying sawdust in a laboratory aquarium; fish not driven out of the 'slack' water and sluggish lake would lie killed by the poisonous extracts, or suffocated in the water which had lost its oxygen.

ON THE OTTAWA RIVER.

The question of whether the Ottawa river is so greatly polluted with sawdust as to diminish its fish life, has been much debated. Assertions could be obtained in abundance both *pro* and *con*, but assertions prove nothing. The indications are all against the popular idea that sawdust is destroying the fish of the Ottawa.

In the first place, we have the testimony of the chemist. Mr. A. McGill, B.A., assistant analyst in the Inland Revenue Department, in 1890, made an exhaustive series of analyses of the Ottawa river water at two different seasons of the year, and as a result of his investigations reported: 'As to the fitness of the Ottawa water for domestic uses, I may say that it contains nothing that must necessarily render it unwholesome.' If Mr. McGill could find nothing in the water that would be likely to harm human life, it is quite unlikely that fish would be injured by it. At any rate, no one has ever proved that Ottawa river water kills fish, and until this is proved, ordinary mortals may well be excused from believing it.

In the second place, many competent observers living along the banks of the Ottawa claim that fish are not injured by the mill rubbish that has for years been drifted into the river. Mr. W. C. Edwards, M.P., is one of these. Writing to me under date of July 19, 1902, he said. 'I have lumbered on the Ottawa river for thirty years, during which time I have never put sawdust or mill refuse into the stream. I have, however, observed what has been going on, and it is not my observation that sawdust has anything to do with deteriorating the number of fish in the river. We have the same kinds and about the same quantity of fish in the Ottawa as we had twenty-five years ago. We think a wonderful lot of nonsense has been preached with regard to this matter. Conditions may possibly be different in very small streams, but so far as the Ottawa is concerned, if we had double the saw-mills on it that it has, and if all the sawdust went into the stream, neither the fishing interests nor navigation to any appreciable extent would be injured.'

Mr. Hiram Robinson, president of the Hawkesbury Lumber Company, writes: 'While we were putting sawdust into the Ottawa at this place, I never knew fish to be affected by it, having frequently seen good sturdy fish caught in our ponds just below the mill.' Sawdust is not now drifted into the river by this company.

Taken along with the opinions of Professor Prince and Mr. S. T. Bastedo, the observations of Mr. Dennistown upon the Otonabee river, and of Messrs. Edwards and Robinson upon the Ottawa show how necessary it is that a thorough investigation should be made into the whole subject.

My own conclusions, based upon laboratory experiments, may be summarized as follows:—

SESSIONAL PAPER No. 22a

CONCLUSIONS.

1. Strong sawdust solutions, such as occur at the bottom of an aquarium, poison adult fish and fish fry, through the agency of compounds dissolved out of the wood cells.

2. The overlying water in such an aquarium does not at first kill fish. After about a week it does kill, but solely through suffocation, the dissolved oxygen having all been used up.

3. Bacteria multiply enormously throughout all parts of such an aquarium, and through oxidation change the poisonous extracts to harmless compounds. Mosquito larvæ live on the bacteria. No doubt, in natural pools, other aquatic insect larvæ live on bacteria also.

4. Subsequent aëration and sedimentation of sawdust water purify it, so that fish can live in it without injury.

5. Since adult fish and black bass fry both refused to be driven into pine extracts in the bottom of an aquarium after they had experienced its poisonous effects, we may infer that fish would desert a river much polluted with freshly made sawdust, going down stream and into tributaries to escape from the disagreeable influence of the sawdust extracts.

6. Further observations and studies along sawdust polluted streams and rivers in Canada are urgently needed before more definite conclusions can be reached. My own observations on the Bonnechere are not sufficient to enable me to form any conclusion that would be applicable to other rivers. In this connection I should like to quote Professor Prince again: 'Circumstances modify the effects of all forms of pollutions, so that waste matters which would be deadly in one river will pass away and prove of little harm in another, where the conditions are different.'

ACKNOWLEDGMENTS.

I must add finally, acknowledgment is due to Toronto University, the Public Library, Toronto, and the Canadian Institute, for the privilege of consulting their libraries in order to write the historical part of this report.

I am under special obligations to my colleague, Prof. J. C. Connell, M.A., M.D., for the large supply of minnows which he procured for me, and which were so indispensable for the laboratory experiments.

Dr. John Waddell and Mr. C. W. Dickson, M.A., both of the School of Mining, Kingston, rendered valuable aid in determining the amount of solid matter in sawdust water.

The Ontario Fisheries Department greatly facilitated my task on the Bonnechere by instructing their overseers to assist me in every way possible.

APPENDIX TO DR. KNIGHT'S REPORT ON SAWDUST AND FISH LIFE.

BACTERIOLOGICAL EXAMINATION OF SAWDUST WATER IN SHADE AND IN SUNSHINE.

Examination of sawdust water in aquarium made July 31, 1902.

Two agar plates made. The first averaged 3,300 colonies of bacteria per cubic centimetre. None of the colonies were spirilla which were present in large numbers in direct microscopic examination of the water. The chief colonies were those of a spore bearing bacillus, a variety evidently of *B. Subtilis*; also a few sarcinae, par-

6-7 EDWARD VII., A. 1907

ticularly one like *Sarcina Lutea*. The second plate averaged 3,570 colonies per cubic centimetre. In general characters they were the same as in the first plate.

August 4, 1902. Water in aquarium. Agar plates averaged 3,570 colonies per cubic centimetre. These were in all respects like those of July 31.

Same water in sunlight since July 31. Agar plates average 4,200 colonies per cubic centimetre. These colonies contain the same bacteria as in the aquarium water, but in fewer numbers. Further, there is present a fluorescent bacillus, making up half the number of colonies present.

August 8, 1902. Water in aquarium. Agar plates develop 7,870 colonies per cubic centimetre. These colonies are of the same type as those found on previous plates with the addition of about 1,000 colonies of *B. Mesentericus Vulgatus* per cubic centimetre.

Water in sunlight. Agar plates develop 37,070 colonies per cubic centimetre. These consist mainly of *B. Fluorescens Liquescens*; also of *Sarcina Lutea*, and an occasional colony of *B. Subtilis*.

W. T. CONNELL,
Prof. of Bacteriology.

V

THE DIATOMACEÆ OF CANSO HARBOUR, NOVA SCOTIA.

A PROVISIONAL LIST.

BY DR. A. H. MACKAY, SUPERINTENDENT OF EDUCATION FOR NOVA SCOTIA.

The following determinations of *Diatomaceæ* from Canso harbour were made from collections taken on September 10, 1902, just before leaving the Marine Biological Laboratory of Canada for the second and last time during the season. One collection was from the scrapings and washings of *Zostera marina* L. in the shallow water near the laboratory, the other from the drippings and washings of *Chorda filum* L. a few hundred yards to the east of the laboratory. In addition I was given a small vial of a schizonematous diatom growing in minute gelatinous colonies which mimic minute species of *ectocarpus*, &c., collected by Mr. C. B. Robinson on the piles of some of the wharves.

As my previous studies of the *Diatomaceæ* were confined to those found in fresh-water deposits, I required more time than I could afford to make a complete study of the rarer species in the collections before the date given me to complete my report. In addition I had the misfortune to be accidentally without any lens of higher power than a one-twelfth inch oil immersion, so that I was unable to make out some of the finer details necessary to determine some of the species, or to measure the number of striæ when more numerous than fifteen to ten microns.

My reference authorities are as follows: 1. 'Diatomaceen Typen-Platte,' No. 484 of J. D. Moller, Wedel in Holstein, April, 1878, containing about 400 types. 2. A. Schmidt's 'Atlas de Diatomaceenkunde,' up to plate 160. 3. George Karsten's 'Die Diatomeen der Kieler Bucht.' 4. Rabenhorst's 'Flora Europæa Algarum Aquæ Dulcis et Submarinæ.' 5. Van Heurck's 'Synopsis (et Atlas) des Diatomées de Belgique.' 6. Peragallo's 'Diatomées Marines de France,' in 'Le Micrograph Préparateur' to date. 7. Wolle's 'Diatomaceæ of North America.' 8. 'Le Diatomiste,' volumes I. and II., 1890 to 1896. 9. 'Diatomées Fossiles du Japon' by Brun of Geneva and Témperé of Paris. 10. 'Diatomées des Alpes et du Jura et de la Région Suisse et Française des Environs de Geneve,' par J. Brun.

A few plankton forms were taken in the collections and also some fresh-water species. But from the *Chorda filum* the great mass consisted of *Striatella unipuncta* Ag. and *Licmophora Lyngbyei* (Kg.) Grun., forming more than 90 per cent probably of the whole mass of diatomaceous material. Several species were seen but lost before determination. I, therefore, present the following list as a provisional one; and propose to still further examine the material from Canso, and to supplement it by a study of the *Diatomaceæ* of Halifax harbour, which I am in a position to be able to explore with more convenience.

The dimensions—length and breadth of valve—are given in microns, which for the sake of compactness are expressed simply in figures. Likewise, the number of striæ, ribs or rows of pearls in 10 microns are given in figures simply.

PROVISIONAL LIST.

1. Amphora _____ (?).
2. Cymbella _____ (?).
3. Stauroneis anceps Ehr., 18 × 6. One specimen.

4. *Stauroneis ventricosa* Kg., 45 × 9. One specimen.
 5. *Navicula viridis* Kg., 100 × 18, Ribs 7 or 8 to 10 microns. Only one specimen.
 6. *Navicula acuminata* W.S., 87 × 10, Striæ very fine. One specimen.
 7. *Navicula cancellata* Donk., 52 × 24 to 58 × 26. About 40 ribs, 6 to 10 microns. In *Chorda filum* collection.
 8. *Navicula distans* W.S., Fragments. Striæ 4 or 5. Two specimens.
 9. *Navicula didyma* Ehr., 45 × 19 to 70 × 25. Striæ about 8. The dimensions are more fully expressed as follows, ranging from 45 × (19:16:19) to 70 × (25:19:25), the middle figure within the bracket indicating the breadth at the middle. Common in the *Zostera* collection.
 10. *Navicula entomon* Ehr., 39 × (14:9:14) to 77 × (24:17:24). Striæ 10 or 11. Not so common as *N. didyma* in the *Zostera* collection.
 11. *Navicula Smithii* Breb., 67 × 40 to 70 × 42. Striæ 6 or 7. Not common.
 12. *Navicula forcipata* Grev., 45 × 20. Rare.
 13. *Navicula aspera* Ehr., 100 × 24 to 120 × 25. Striæ from 19 to 13. Somewhat common.
 14. *Navicula Baileyana* A. S., Var. (?). 63 × 33. Striæ 9 or 10. This may be a variety of the following. One specimen.
 15. *Navicula marina* Ralfs., 80 × 33. Striæ 9. One specimen.
 16. *Navicula corymbosa* Ag., 21 × 3.5 to 27 × 5.5. Striæ very fine. Averaging 24 × 5. They grew massed on filamentous fronds of gelatine which subdivide like minute branching olive colored seaweed, attached to the piles supporting the wharves. This is a *Schizonema* of the older writers, and does not appear to be very different from the following species, according to Rabenhorst. Karsten differentiates them more widely.
 17. *Navicula ramosissimum* Ag., 30 × 4.5 to 30 × 6. Striæ 13. Found with the above, of which it may be a variety.
 18. *Navicula mollis* W.S., 40 × 6. Found sparingly with the above; but whether it is a distinct species or not is a matter of doubt.
 19. *Navicula pelliculosa* (Breb.) Hilse., 13 × 11. Striæ invisible with a one-twelfth oil immersion lens.
- With further study the last four determinations may require to be revised. A stronger lens and a study of the plants in their habitat may give additional information. There appears to be a lack of agreement in important particulars between the ideas held of these species by several of the authorities named above.
20. *Pleurosigma decorum* W.S., 220 × 27 to 240 × 35. Oblique striæ cutting at about 70°. Oblique striæ 12 or 13; horizontal about 15 ±.
 21. *Pleurosigma Aestuarii* S.W., 97 × 23. Striæ just visible in the one-twelfth. This looks also very much like *Pl. latum*, Cl. as figured and described by Peragallo. One specimen observed.
 22. *Pleurosigma Balticum* W.S., 270 × 30. Several specimens seen.
 23. *Rhoicosigma* _____ (?).
 24. *Rhoicosphenia curvata* (Kg.) Grun. Var. *marinum*, 30 × 12 to 35 × 12. Striæ 15 ±.
 25. *Achnanthes subsessilis* Kg., 56 × 9 to 60 × 20. Striæ 8 or 9. Not very rare.
 26. *Achnanthes longipes* Ag., 80 × 33. Large striæ 6 in 10 microns with two rows of pearls between each. Small striæ about 14. Rare. Found only with the *Navicula corymbosa* material.
 27. *Cocconeis scutellum* Ehr., 20 × 12 to 27 × 18. Rows 12. Very common.
 28. *Cocconeis costata* Greg., 11 × 6 to 18 × 7.5. Striæ about 10. Common. Can hardly be a variety of the preceding species.
 29. *Cocconeis ambigua* Grun., 12 × 5 to 13 × 7. Doubtful.
 30. *Eunotia* _____ (?), 69 × (5:6:7:6:5). Striæ 13. Comes near *Eunotia pectinalis* (Kg.) Rab.; but the centre is swollen symmetrically both above and below the general arch. That is the ends are about 5 microns, the general length about six microns thick, while the middle swells abruptly to about 7 microns in thickness.

SESSIONAL PAPER No. 22a

31. *Eunotia* ————— (?), 21×14 , striæ about 15. One specimen.
32. *Synedra affinis* (Kg.), $75 \times (3.5:4:3.5)$ to 90×3.5 , Striæ 13. Not uncommon in *Chorda* collection.
33. *Synedra Gallionii*, Ehr., $240 \times (6:7:6)$ to $300 \times (7:8:7)$. Striæ 10 or 11. Rather common in *Chorda* and also *Zostera* collections.
34. *Synedra crystallina* (Lyngb.) Kg., $375 \times (9:8:11:8:9)$ to $600 \times (10:8:13:8:10)$. Striæ 15 +. Common.
35. *Synedra fulgens* (Kg.) W. S., $240 \times (9:7:10:7:9)$ to $340 \times (10:8:12:8:10)$. Striæ 12 to 14 or more. Karsten's *S. crystallina* does not appear to agree with Moller's type nor with the descriptions and figures in Van Heurck and Wolle, for instance. Van Heurck's *S. fulgens* is practically a reduced *S. crystallina*. Many of the specimens in these collections where *S. fulgens* is very common, while retaining the general shape of the larger species, have the striation generally coarser instead of finer. At least this appears from a large number of estimates if not exact measurements which I noted.
36. *Synedra undulata* (Bailey) Greg. $550 \times (7:4:9:4:7)$. Striæ about 12. Only one specimen of this splendid species has been noted, and it is in close agreement with the type.
37. *Homœocladia capitata* H. L. S. 22×3 . Striæ $12 \pm$. From its smallness the determination of this species may be considered doubtful.
38. *Fragillaria hyalina* (Kg.) Grun. (?).
39. *Fragillaria Pacifica*, Grun. 25×6 . Striæ 15. (?).
40. *Fragillaria amphicephala* Ehr. 45×11 . Striæ not visible in the 1-12. Doubtful, as only one specimen was noted.
41. *Licmophora Lyngbyei* (Kg.) Grun. $40 \times (12:3)$ to $60 \times (24:3)$ to $80 \times (8:2)$. Striæ about 15 or less. This is the species which next to *Striatella unipuncta* is the most abundant in the *Chorda* collection. It is possible that the variations of proportion observed may be too great for combination into one species. A separation of the species, if there are more than one, requires more investigation of the plants in their habitat.
42. *Licmophora* ————— (?). Somewhat ovate-fan shaped like *Podosphenia Baileyi* of Edwards. Roundish but drawn at the base into a cuneate stem. Height and breadth varying from 40×25 to 50×28 to 54×33 to 66×47 to 67×45 . A central line, sometimes doubled runs like the midrib of a leaf through the delicate frond which generally shows under the 1-12 oil immersion, a faint striation at right angles to the midrib, which striation becomes fainter as it ascends until it becomes invisible before the middle of the frond is reached. It does not appear to be strongly silicified, for prolonged boiling in nitric acid decomposes it. When heated on the cover glass before being mounted in balsam it is more or less distorted. Lack of time has prevented my complete study of the form; so that I can merely say it may be a diatom, and it may not.
43. *Grammatophora marina* (Lyngb.) Kg. 30×10 to 40×15 to 42×9 . Striæ often not visible in the 1-12th. Common.
44. *Grammatophora Oceanica* Ehr. 54×9 to 70×15 to 75×12 . Striæ invisible. Not uncommon. Looks often like *Gr. stricta*, Ehr.
45. *Grammatophora* ————— (?) 30×15 to 45×16 . Striæ: 12 to 13. Like a variety of *Gr. angulosa* Ehr., or of *Gr. serpentina* Ehr. with the serpentine line shortened to three undulations—a Greek *e* depending from a stemmed hook.
46. *Striatella unipuncta* Ag. Valves 60×18 to 80×20 to 87×24 . Groups 78 to 107 microns across. The most abundant diatom, especially in the *Chorda* collection.
47. *Rhabdonema arcuatum* Kg. Valves 30×14 to 57×30 to 70×21 . Groups across valves 54 to 73 to 105. Striæ 6 to 8. Common.
48. *Nitzschia punctata* (W.S.) Grun., 44×18 to 50×18 . Rows of pearls 8 to 10 microns. With the *N. corymbosa* collection.

49. *Nitzschia vermicularis* (Kg.) Grun., $165 \times (9:12:9 \text{ to } 175 \times 13 \text{ to } 210 \times (7.5:9.5:7.5))$. Pearls about 7.
50. *Nitzschia lanceolata* W. S., 140×12 . Pearls about 6 to 10 microns. One specimen in *Zostera* collection.
51. *Nitzschia plana* W. S., 150×17 . Striæ (coarse and fine) 7 and 18. One specimen noted.
52. *Nitzschia Sigma* W. S. Var. *intercedens* Grun., $280 \times 8 \text{ to } 295 \times 15$. Striæ about 6. Not uncommon.
53. *Nitzschia Closterium* W. S., 120×6 . Not strongly silicified.
54. *Nitzschia paradoxa* Grun., 100×5 . An interesting plankton species.
55. *Surirella Gemma* Ehr., 108×50 . Costæ 2 or 3 to 10 microns. One specimen.
56. *Campylodiscus decorus* Breb. One specimen.
57. *Campylodiscus*—————(?). Suborbicular, 50 microns in diameter. Marginal costæ against larger and smaller parts of circumference about 2 or 2.5 to 10 microns. Subcentral area 50×22 with striæ running from ends of costæ into a slightly curved and eccentric diameter line; 10 striæ to 10 microns. Approaches *C. Thuretii* Breb. and *C. Samoensis* Grun. Van Heurck's description of *C. Thuretii* applies exactly to the specimen, although the figure given in the Atlas shows something like three pseudoraphes instead of the one referred to above as the curved eccentric diameter.
57. *Chætoceros Janischianum* (?). A plankton form of which one specimen was observed in a mount from one of the collections.
58. *Melosira distans* Ag. Diameters 9 to 14. Length of joints 5 to 7.
59. *Melosira sulcata* Kg. (?).
60. *Melosira sculpta* Ehr., 21 to 24 in diameter. Joints or frustules 5 to 6.
61. *Melosira granulata* (Ehr.) Ralfs. 18 to 22 in diameter, 48 points around circumference of frustule. Frustule 18×6 . Rows of granules 9 in 10 microns.
62. *Melosira nummuloides* Ag. Diameter 12 to 27 microns. Quite abundant in the *N. corymbosa* material. Very faint, irregular and defective longitudinal wavy striations, closer than one micron when not defective, just visible on the frustules.
63. *Biddulphia aurita* (Lyngb) Breb. $(12 + 15 + 10) \times 16.5$, $(12 + 18 + 12) \times 24$, $(12 + 14 + 11) \times 27$, $(10 + 12 + 11) \times 30$. Rows of points about 10 in 10 microns, and uniform over middle segment and end segments. The type of this species in Moller's Typen-Platte, has larger granules or points on the domed end segments.
64. *Biddulphia Ropcriana* Grev. $(14 + 28 + 12) \times 37$ to $(18 + 23 + 13) \times 62$. Rows of points about 7 to 8 on cylinder, more crowded on domes. These two last species are not uncommon; and they look so much alike that it is a question if they should not be considered two varieties of the same species.
65. *Triceratium* —————(?). Specimen 12 microns in diameter.
66. *Auliscus* —————(?) One specimen seen but lost.
67. *Actinoptychus undulatus* Ehr. (?).
68. *Actinocyclus* —————(?). Diameter 45 microns.
69. *Hyalodiscus subtilis*, Bailey. Diameter 24 to 27. Dark center 8 to 10.
69. *Cyclotella operculata* Kg. (?). Diameter 12 microns.
70. *Coscinodiscus radiatus* Ehr. Rare.
71. *C. robusta* Grev. Fragment. Each alveolus 3 microns in diameter.
72. *C. excentricus* Grun. (?). Diameter 25 microns.
73. *C. concavus* Ehr. (?) 45 microns in diameter.

VI

REPORT ON THE FLORA OF CANSO, NOVA SCOTIA.

BY PROF. JAMES FOWLER, LL.D., F.R.S.C., QUEEN'S UNIVERSITY,
KINGSTON.

During the summer of 1901 the writer enjoyed the privilege of spending a part of the season (June 28 to August 26) at Canso, N.S., collecting specimens of the flora occurring in the neighbourhood. Through the kindness of Professor Ramsay Wright, assistant director, who had charge of the Biological Laboratory, he was furnished with table, room and other conveniences, and was thus enabled to make it his headquarters during his visit to the locality. The town of Canso is situated on the most eastern point of the mainland of North America south of Labrador, at the entrance to Chedabucto bay, on the sixtieth degree of longitude, and nearly due south of the town of Arichat on Isle Madame. It is consequently exposed to the cool, damp winds and frequent fogs of the Atlantic coast. The district around is composed very largely of barren rocks and bogs varied by the presence of a few huge mounds of glacial debris. Two of these, rising respectively to the height of 119 and 117 feet, furnish an imposing background to the eastern part of the town. Every visitor who wanders over these heights on a clear summer day must be impressed by the grandeur of the view. Northwards the eye wanders over a vast extent of sea and islands across the bay to Isle Madame in Cape Breton; on the west and south the expanse of rock and bog and hill stretches away to the distant horizon, and on the east a few islands lie near the shore, and the great ocean stretches away beyond. The large number of fishing vessels and boats in the harbour at all times give it a very lively and pleasing appearance.

PECULIARITIES OF THE VEGETATION.

1. The first peculiarity that attracts the attention of the visitor, especially if he is interested in botanical pursuits, is the almost total absence of trees as far as the eye can see. No shade trees are planted, their absence being abundantly compensated for by the cool sea breezes and fogs. Two species of European Willows (*Salix viminalis*, L., and *S. fragilis*, L.) are common near dwelling houses and seem to have been introduced by the early settlers. The ancient forest has been all cleared away by the axe and the fires of previous generations, and over a large area only bare rocks and intervening bogs greet the eye. The glacial mounds, mentioned above, constitute nearly the whole of the cultivated land and have been partially transformed into grass fields. At Hazel Hill, about a mile and a half distant, the prospect is much more cheerful. The beautiful houses erected by the Commercial Cable Company for their employees, are situated on the side of a hill, and command an extensive view of hills and lakes and barren plains and bogs.

2. Another notable characteristic is the prevalence of low, stunted forms of vegetation, not only on the rocks, but on the shores and the hillsides. Herbaceous species which should attain a height of two or three feet are dwarfed to a few inches, except in specially sheltered positions. The most common species of pine (*Pinus divaricata*, Ait., *P. Banksiana*, Lambert) sends down its roots into the clefts of the rocks and spreads over the surface, producing abundance of flowers and cones before it attains

a height of three feet above the ground. Spruce and fir trees, only a few feet in height, produce thick, strong trunks to resist the winter gales to which they are exposed, and furnish a suitable shelter around their base for a few lowly forms such as the Twin-flower (*Linnæa borealis*, L.) and the little wintergreen (*Pyrola secunda pumila*, Gray.) The prostrate form of the Juniper (*Juniperus nana*, Willd), the Crowberry (*Empetrum nigrum*, L.) and two species of cranberries are exceedingly abundant, where suitable ecological conditions prevail. In exposed situations, where other plants are often wanting, the three-toothed cinque-foil (*Potentilla tridentata*, Ait.) often covers the surface and continues flowering during the whole summer. Portions of many of the bogs are brilliant with the pitcher plant (*Sarracenia purpurea*, L.) or with the two beautiful orchids *Limodorum tuberosum*, L., and *Arethusa bulbosa*, L. The Baked-Apple Berry (*Rubus Chamæmorus*, L.) is also exceedingly abundant. The bogs are covered with various species of Sphagnum, whilst a few native grasses, intermingled with imported species, form a thick sward, wherever sufficient soil exists to secure a foothold.

3. The exceedingly small number of introduced weeds in the town and the neighbouring districts is another striking peculiarity. No large areas occur covered with buttercups (*Ranunculus acris*, L.) or Dandelions, as in many districts in the Dominion. Even thistles are confined to a very few exceedingly limited spots. Only a single specimen of *Senecio Jacobæa*, L. (the stinking Willie of Pictou), which is such a pest to the farmers in some other localities, especially in the county of Pictou, was seen during the whole season. The sheep sorrel (*Rumex Acetosella*, L.) so abundant elsewhere was difficult to find. In a small patch of wheat near Hazel Hill—the only patch seen in the neighbourhood, the common Corn Spurrey (*Spergula arvensis*, L.) had found a temporary foothold, having been sown, no doubt, with the grain. The Ox-eye Daisy (*Chrysanthemum Leucanthemum* L.) and the Plantain (*Plantago major*, L.) were probably the most abundant of the introduced weeds. The field mustard (*Brassica arvensis*, L.) which has taken possession of many farms in Ontario, was only conspicuous by its almost complete absence.

CAUSES OF THE SMALL NUMBER OF SPECIES.

The existence of these peculiarities naturally suggests inquiry into the causes to which they owe their existence. The following seem to be the most influential factors producing the present condition of the vegetation:—

1. 'A very high authority on the natural sources of our Dominion once explained to Lord Lansdowne, in answer to an inquiry, that the chief industry of Canadians was the destruction of forests.*' The early settlers were compelled by force of circumstances to fell the forests to procure materials for buildings, and also for fuel. Fires are always necessary for the clearing of land, and generally spread over the whole area where brush or fallen trees furnish combustible supplies. Where the soil is thin, or consists of humus produced by decaying vegetation, the whole surface may be destroyed, and only bare rock remain where a dense forest growth had previously existed. At the present time, whenever a young tree attains sufficient size to be of any service for any purpose it is immediately cut down and removed. The destruction of the trees necessarily involves the destruction of all the species of plants that grow under their shade, and of all the mosses, lichens and fungi that find a congenial home on their trunks and roots. The exposure of the rocky surfaces to the fierce winds of winter prevent the growth of even the lowest forms of vegetation, except in sheltered situations. These facts account for the small number of native species occurring in the neighbourhood.

2. Very little cultivated land exists in the neighbourhood of the town. A few grass fields on the glacial mounds, and a very limited number of gardens, constitute

* W. H. Muldrew, *Sylvan, Ontario*, p. 3.

SESSIONAL PAPER No. 22a

the whole area subject to cultivation. As a consequence, no importation of foreign grains with their accompanying weeds takes place. The lack of railway communication also prevents the introduction of the many species of weeds which travel by train, and accounts in a large measure for the fact that so few foreign plants have reached the locality.

3. The domestic animals enjoy the liberty of the streets and wander over the uncultivated lands at will, appropriating every vegetable product suited to their taste. The species of plants fitted for their food are consequently subjected to a severe struggle for existence, and only a few are successful in finding defensive retreats among the rocks, thus securing a precarious tenure of life.

4. The most important ecological factors are the chill sea breezes and the Atlantic fogs. These prevent the growth of many species of plants found in other parts of the province where the average temperature and the amount of sunshine during the summer months are much greater. The ice floes, brought down by the current from the north in spring, lower the temperature of the sea waters and of the atmosphere above them, whilst the heated plains and fields of the interior attract the cool breezes to fill the vacancy produced by the ascending aerial currents. The situation of Canso exposes it to the full influences of the winds from the Atlantic, and renders it a pleasant retreat for those who flee from the heated towns of the interior or of the south.

LIST OF PLANTS COLLECTED AT CANSO, NOVA SCOTIA, JUNE 29 TO
AUGUST 24, 1901.

BY PROF. JAMES FOWLER.

NOTE.—The nomenclature is that of Brown and Britton, Illustrated Flora.

I. Ranunculaceæ.

1. *Coptis trifolia* (L.) Salisb.
2. *Oxygraphis Cymbalaria*, Prantl.
3. *Ranunculus acris*, L.
4. *Ranunculus repens*, L.
5. *Thalictrum polygamum*, Muhl.

II. Nymphaeaceæ.

6. *Castalia odorata*, Woodv.
7. *Nymphaea advena*, Soland.

III. Sarraceniaceæ.

8. *Sarracenia purpurea*, L.

IV. Cruciferæ.

9. *Brassica arvensis* (L.), B.S.P.
10. *Bursa Bursa-pastoris*, Britton.
11. *Cakile edentula* (Bigel.), Hook.

V. Violaceæ.

12. *Viola blanda*, Willd.

VI. Caryophyllaceæ.

13. *Alsine graminea*, (L.) Britton.
14. *Alsine media*, L.
15. *Ammadenia peploides*.
16. *Cerastium vulgatum*, L.
17. *Moehringia lateriflora*, L.
18. *Sagina nodosa*, (L.) Fenzl.
19. *Sagina procumbens*, L.
20. *Spergula arvensis*, L.
21. *Tissa marina*, (L.) Britton.
22. *Tissa rubra*, (L.) Britton.

VII. Hypericaceæ.

23. *Hypericum Canadense*, L.
24. *Triadenum Virginicum*, (L.) Raf.

VIII. Geraniaceæ.

25. *Oxalis Acetosella*, L.

IX. Ilicineæ.

26. *Ilex verticillata*, (L.) Gray.
27. *Ilicioides mucronata*, (L.) Britton.

X. Sapindaceæ.

28. *Acer rubrum*, L.

XI. Leguminosæ.

29. *Lathyrus palustris*, L.
30. *Trifolium pratense*, L.
31. *Trifolium repens*, L.
32. *Vicia Cracca*, L.

XII. Rosaceæ.

33. *Amelanchier alnifolia*, Nutt.
34. *Amelanchier Canadensis*, L.
35. *Aronia nigra*, Britton.
36. *Crataegus oxyacantha*, L.
37. *Fragaria Virginiana*, Mill.
38. *Potentilla Anserina*, L.
39. *P. Canadensis*, L.
40. *P. Monspeliensis*, L.
41. *P. tridentata*, Soland.
42. *Prunus Pennsylvanica*, L.
43. *Rosa humilis lucida*, Best.
44. *Rubus Americanus*, (Pers.) Britton.
45. *R. Canadensis*, L.
46. *R. Chamaemorus*, L.
47. *R. hispidus*, L.
48. *R. strigosus*, Michx.
49. *R. villosus*, Ait.
50. *R. villosus frondosus*, Bigel.
51. *Sorbus Americana*, Marsh.
52. *S. sambucifolia*, Roem.

SESSIONAL PAPER No. 22a

XIII. Saxifragaceæ.

53. *Ribes oxyacanthoides*, L.
54. *R. prostratum*, L'Her.

XIV. Crassulaceæ.

55. *Sedum roseum*, (L.) Scop.

XV.. Droseraceæ.

56. *Drosera intermedia*, Hayne.
57. *D. rotundifolia*, L.

XVI. Onagraceæ.

58. *Chamaenerion angustifolium*, Scop.
59. *Circæa alpina*, L.
60. *Epilobium lineare*, Muhl.

XVII. Umbelliferæ.

61. *Ligusticum Scoticum*, L.

XVIII. Araliaceæ.

62. *Aralia hispida*, Vent.
63. *A. nudicaulis*, L.

XIX. Cornaceæ.

64. *Cornus Canadensis*, L.

XX. Caprifoliaceæ.

65. *Diervilla Diervilla*, (L.) McM.
66. *Linnæa borealis*, L.
67. *Viburnum cassinoides*, L.

XXI. Rubiaceæ.

68. *Galium tinctorium Labradoricum*, Weigand.
69. *Mitchella repens*, L.

XXII. Compositæ.

70. *Achillea Millefolium*, L.
71. *A. Ptarmica*, L.
72. *Ambrosia artemisiæfolia*, L.
73. *Anaphalis margaritacea*, Benth. and Hook.
74. *Anthemis Cotula*, L.
75. *Aster acuminatus*, Michx.
76. *A. nemoralis*, Ait.
77. *A. Radula*, Ait.
78. *Carduus arvensis*, (L.) Rob.
79. *C. lanceolatus*, L.
80. *Chrysanthemum Leucanthemum*, L.
81. *Doellingeria umbellata*, Nees.
82. *Euthamia graminifolia*, Nutt.
83. *Gnaphalium uliginosum*, L.
84. *Leontodon autumnale*, L.
85. *Nabalus albus*, (L.) Hook.
86. *N. trifoliolatus*, Cass.

XXII. Compositæ—Concluded.

- 87. *Senecio Jacobæa*, L.
- 88. *S. vulgaris*, L.
- 89. *Solidago juncea*, Ait.
- 90. *S. neglecta*, Torr. and Gray.
- 91. *S. puberula*, Nutt.

VII

THE SEAWEEDS OF CANSO.

BEING A CONTRIBUTION TO THE STUDY OF EASTERN NOVA SCOTIA ALGÆ'

BY C. B. ROBINSON, B.A., PICTOU ACADEMY.

The month of August spent by me at the Marine Biological Station during its second season at Canso (1902) was almost entirely devoted to the determination of the Marine Algæ.

The region was such as to permit the gathering of species having the most varied habitat, deep-water forms being occasionally dredged in great abundance, while *Laminariæ* and *Fuci*, with their associates, grew nearly everywhere below and between tide marks. Tide pools of varying range and size were also easily accessible, and the quieter coves and the wharves yielded other forms. My available time, indeed, proved quite too short for a complete investigation of this portion of the flora of the district.

The clear water frequently made it possible to see large patches of algæ growing upon the bottom at depths of about ten fathoms. The results obtained by dredging in these and somewhat deeper places indicated that the bulk of this was composed of *Ptilota pectinata*, acting as host, however, to many hydroids and other small animals, besides several species of red algæ. Of the latter, *Delesseria alata* was much the most frequent, though the plant seen thus in greatest quantity upon any single occasion was *Euthora cristata angustata*. *Rhodophyllis dichotoma* was also obtained several times, and four species of *Callithamnion* occurred, of which *C. Pylaisæi* and *C. Americanum* were the most plentiful. A small form of this genus, also one each of *Ceramium* and *Polysiphonia*, were often found upon the larger algæ and upon hydroids. These were always sterile, and could not be identified. On the stouter portions of *Polysiphonia* two microscopic encrusting species also grew, one *Erythrotrichia ceramicola*, the other may be the European *Actinococcus*.

Odonthalia dentata and *Rhodomela subfusca* were each dredged on a single occasion only.

In deep places under wharves beautiful specimens of *Delesseria sinuosa* could be gathered, and it also was frequently found in the dredge. The corallines were also abundant, and six species of *Polysiphonia* were collected, of which *P. urceolata*, often fruiting, was the most plentiful. The determination of *P. Olneyi* rests upon a few sterile filaments, and may be inaccurate.

But perhaps the most striking fact regarding the red algæ was the comparative scarcity of some of the best known and most widely distributed genera. *Ceramium* was represented by a few filaments; *Chondrus* and *Rhodymenia* were seen but rarely, *Gigartina* only once.

The *Phæophyceæ* constitute much the greater part of the littoral flora, and while not quite equalling the *Florideæ* in the total number of species found, far surpass them in individuals.

Among the *Fuci* were *F. evanescens* and *F. filiformis*, the former washed ashore near the laboratory, the latter gathered in tide pools on Cranberry. *F. serratus*, which rivals *F. vesiculosus* in abundance at Pictou, and which has recently been found on the Cape Breton coast, was carefully watched for, and apparently does not occur.

Chorda filum, everywhere plentiful, grew in great luxuriance in Grassy Cove, the fronds usually exceeding twenty feet in length. *Agarum Turneri* was found in several

localities, *Alaria esculenta* on Cranberry rock only. *Desmarestia viridis* was common both in dredged material and cast up on the shore, *Chordaria flagelliformis* somewhat less so, while *Desmarestia aculeata* was rather rare. *Castagnea virescens* was but once obtained, but the filaments, when examined microscopically, were found to be densely crowded with spores, and very beautiful.

Elachista fucicola was extremely common throughout the month; *Leathesia difformis*, always scarcer, became rare after the first fortnight. A single imperfect specimen of *Chætopteris plumosa* occurred in plankton.

Ectocarpus was represented by six species and varieties, including *E. Chordariæ* and *E. reptans*, the former growing upon *Obelia*, the latter upon *Chorda*. The organism, however, which usually composed the brownish tufts upon the piles of the wharves, was not one of these, but a diatom, *Navicula mollis*, numerous individuals of which were inclosed within tubes of mucilage, thus forming a false filament.

The *Chlorophyceæ* were less carefully studied, and the list is believed to be somewhat incomplete. Six species of *Cladophora* were determined, obtained chiefly from tide pools. A few filaments only were seen of *Chætomorpha Picquotiana*, though upon one occasion a considerable quantity was found of a plant, which, rather resembling *Cladophora* in general appearance, seemed never to branch, and answered well to the description of *Chætomorpha longiarticulata*. The filaments were much more slender and less wiry than those of the other species of this genus, and it was probably a *Rhizoclonium*.

The blue-green algæ listed were found as detached filaments, while examining higher forms, no special effort being made to collect them.

It will be noticed that while *Ptilota*, *Euthora*, and *Delesseria sinuosa*, usually considered amongst the most beautiful red algæ of north-eastern America, are common, *Chondrus* and *Rhodomenia*, the more useful genera of this group, are unusually scarce. On the other hand, nearly all the brown algæ of commercial importance may be had in considerable quantities.

Prof. Farlow very kindly named for me some species about which I was in doubt, and to him and to all of the gentlemen with whom I had the privilege of working at the station, my most grateful thanks are due for assistance and helpful suggestions.

The following is a detailed list of the species observed:—

SCHIZOPHYTA.

SCHIZOPHYCEÆ (CYANOPHYCEÆ).

Hormogoneæ.

 Phymatolithon sp.

VIII

REPORT ON THE MARINE POLYZOA OF CANSO, N.S.

By GEORGE A. CORNISH, B.A., TORONTO.

Science Master in the Collegiate Institute, Lindsay, Ont.

The following report embodies the results of about seven weeks' work done at the Marine Biological Station of Canada during July and August, 1902. I collected along the beaches, under wharfs, and on kelp washed on the shore. Some dredging was done in the neighbourhood in from 10-25 fathoms, and one of my best sources was stones, tunicates, sponges, &c., brought up on the trawl of the steamer *Active*, which went out a few miles daily to fish for cod and haddock in 20 to 25 fathoms.

My identification depends almost entirely on Hincks' British Marine Polyzoa, as it, the Challenger Reports and Verrill's Report on Invertebrate Fauna of Vineyard Sound were all the accessible literature at the station on this subject.

FAMILY: ÆTEIDÆ.

Aetea truncata (Landsborough).—A colony intermingled with *Obelia commissuralis* growing on a mussel shell (*Mytilus edulis*) was found under a wharf. It is the branched variety, and is exactly like Hincks' illustration, Plate II., fig. 3, except that the tubular appendage is absent in every case and that it is considerably more branched.

FAMILY: EUCRATIIDÆ.

Gemellaria loricata (Linnæus).—A beautiful, bushy, white tuft, two and one-half inches high, attached to a stone, was taken by the trawler *Active*. There is a tinge of brown on the larger branches, but the greater part is pure white; the pits on the wall are extremely small. I have also seen the brown form in about 20 fathoms. In the form and proportion of parts it answers completely to *G. willisii*, Dawson, as described in Hincks' British Marine Polyzoa, p. 21.

Scruparia clavata, Hincks.—Branches on mussel shells (*Mytilus edulis*) were found under wharfs. Some in single file, some back to back, are found in the same branch.

FAMILY: CELLULARIIDÆ.

Menipea ternata (Ellis and Solander).—The following are my notes on this species: July 20, a small patch found on an ascidian taken at Canso. I find no trace of anterior avicularia; lateral avicularia are very distinct, and there is always a large spine on the peristome just inside this avicularium. The operculum varies a good deal in size and shape, and in many is crenate on the free margin, having two or three rounded teeth; it has a thickened border surrounding a deep, flat centre; the tendrils are very long. August 1, specimens were taken from a stone taken by the trawler *Active* in Chedabucto Bay, in about 12-20 fathoms. There is no grouping in triplets, but about seven zoœcia occupy each internode; the anterior avicularium is quite distinct on the upper zoœcium of each internode, and also on some others. The lateral avicularia are not so prominent as in Hincks' illustrations. The operculum covers the greater part of the orifice, and is marked on the front surface. August 19, a tangle of this species mixed with an

6-7 EDWARD VII., A. 1907

hydroid was dredged in 20 fathoms. It answers in every respect to the one of August the first. The median avicularium is present on most of the cells, and some of them are of good size. Spines vary from one to three, and toward the upper part of the colony they are very long.

Scrupocellaria elliptica (Reuss).—A branch of this species about two centimetres high was taken from a stone brought up by a trawl from 30 to 50 fathoms. It is twice dichotomously branched; the vibracula are very long and serrated on one margin; the spines above the orifice vary greatly in length, and many are very long.

Caberea ellisii (Fleming).—This species is common. It was dredged in 30 to 50 fathoms, attached to a sponge and to *Terebratulina septentrionalis*; considerable quantities of it were also dredged in 20 fathoms attached to *Balanus*, stones, &c.

FAMILY: BICELLARIIDÆ.

Bugula sp.—One specimen about one inch in length was found on a mussel shell (*Mytilus edulis*) taken just below low water under a wharf at Canso. The zoarium is ascending, racemose, regularly dichotomously branched, the branches being rather narrow, and composed regularly of two series of zoœcia alternate with each other. The zoœcia are long, slightly tapering toward the base, and have at the upper part of the orifice five spines. The largest spine is at the upper outer corner; right in front of the larger spine is another one; a pair of spines, one on each side of the peristome, arise just below the other spines and almost or quite overlap each other; the lower inner spine sometimes absent; the orifice is very large, occupying almost the whole front of the zoœcium. Avicularia are entirely marginal in the form of bird's heads. They are pedunculated, and one is attached to the outer margin of each zoœcium considerably above the middle; they are stout, being about two-thirds as broad as long, and have both beaks hooked; they are attached by a disk-like base; the oœcia are almost globular, flattish at the lower end; they are raised, and attached by a narrow neck to the zoœcium below. On one polypide I counted twelve tentacles, on another thirteen. This species differs from *B. avicularia* in the form of the zoarium, the number of spines, in the fact that the avicularia are not elongated but quite stout, and in the number of tentacles.

FAMILY: MEMBRANIPORIDÆ.

Membranipora pilosa (Linnæus).—This is found very commonly about Canso in depths of 10-15 fathoms. I found it on fronds of *Rhodymenia palmata*, *Ptilota plumosa*, and on the stipes of *Laminaria longicuris* washed up on the beach. It sometimes forms narrow patches one inch long and two to four cells wide on *Rhodymenia*, and in this case the basal spine is aborted, but the peristome is surrounded by about five rather short spines directed toward the centre of the peristome. Another peculiarity of this specimen is that on each side of the peristome there is an elliptical, transparent patch about one-fourth the diameter of the peristome. On *Laminaria* it forms encrusting masses, covering frequently the whole stipe. In these the basal spine is present but very short, and the marginal spines are often reduced to two lateral ones near the upper edge of the peristome. The peristome is very large, about one and one-half times the length of the tube below it. Specimens got on *Rhodymenia* and *Ptilota*, near Cranberry Light, in 15 fathoms, formed white encrusting masses, and had typical structure with very long basal spines.

Membranipora lineata (Linnæus).—Small patches were found quite frequently on *Laminaria* just below tide-mark. They are quite normal, except that some have as many as fourteen spines. A beautiful lace-like colony, two inches long, was found on a mussel shell. Every cell had a very prominent avicularium just below its orifice, which is raised greatly, and has its acute mandible never pointing down but always

SESSIONAL PAPER No. 22a

obliquely upward. Generally only one pair of spines is present, and these are erect and situated near the top of the orifice.

FAMILY: CRIBRILINIDÆ

Cribrilina punctata (Hassall)?—I found two specimens, the identity of the first of which I am not sure. The first specimen was found encrusting a shell of *Litorina* which was inhabited by a hermit crab. The boundaries of the cells of the zoarium are not distinct; the whole front of the zoecium is perforated with punctures of large size, giving it a reticulated appearance; the peristome is not greatly thickened on the lower edge, and bears no mucro; it has two spines on the upper margin that are directed inwards. The avicularia are generally absent, but an occasional one is seen on the edge of the peristome. The oœcia are large, covered with punctures, and contain ova of a beautiful pink colour. The second specimen was found on a stone at low-water mark. The two lateral avicularia are present on almost every cell. The spines on the peristome are rather irregular in number, some cells having none, some two. The lower border of the peristome is very slightly thickened, but the mucro is absent.

Cribrilina annulata (Fabricius).—Several very small patches were found on a stone between tide-marks, and a small patch 5 mm. in diameter, together with several other small patches, consisting of from one to three cells, was obtained from the frond of *Rhodymenia palmata* dredged in 20 fathoms, near the entrance to Canso harbour. All the specimens are of a pure white colour. In the larger patch on *Rhodymenia* the marginal zoœcia retain a pair of transparent spots laterally, also two above the orifice.

FAMILY: MYRIOZOIDÆ.

Schizoporella sinuosa (Busk).—A very old, encrusting mass was found on a stone taken by the trawler *Active*. The individuals can be distinguished by the naked eye. The orifice is orbicular, produced into an angle below. The wall is punctured, especially near the edge, where the punctures are large.

Schizoporella hyalina (Linnæus).—This species is very common about Canso. I have found it on *Laminaria longicurris*, *Fucus vesiculosus*, *Ascophyllum nodosum* and a red alga. In all cases it was found in very shallow water or just below tide-mark. The lateral denticles vary a good deal in size, sometimes being very conspicuous when the ventral sinus is deep, or very small when the ventral sinus is shallow.

FAMILYS ESCHARIDÆ.

Lepralia pallasiana (Moll).—A colony was found on a stone taken from under a wharf. There is no umbo, avicularia nor oœcia present; the reticulation is very pronounced and beautiful, the margin of the peristome is not greatly raised and its lower margin is more strongly curved than is indicated in Hincks' drawings.

Lepralia pertusa (Esper).—Specimens were found encrusting an ascidian dredged by the trawler *Active*. As I am not at all sure of the identity of this specimen, I shall give my notes in full. July 19: Zoarium encrusting of a white colour in several small patches. Zoœcia are very distinct, separated by raised lines, and form radiating rows; they are mostly rectangular, a few having a pointed base; a very distinct line of large pores at each lateral edge border the dividing, raised lines; these pores are separated by ridges passing inward radially for a short distance; the orifice is transversely elliptical with a distinct sinus on the lower side; just below the lower lip is a raised, conical or tubular structure with an opening circular above, but prolonged into an angle below; this structure does not come out straight but runs obliquely toward the orifice, no avicularia are present. Every feature is very distinct. July 27: Another specimen taken which is younger. It has an orange appearance and the walls

are translucent; the zoëcia are rather less regular in shape but are arranged in regular lines.

Porella concinna (Busk).—One specimen was got from a stone taken by the trawler *Active*. The wall is thickly punctured, the cells are not distinctly divided, the cell-wall is much raised about the orifice; the avicularia are generally present on the lower lip.

Escharoides rosacea (Busk).—A single specimen 5.6 mm. high divided into two lobes was taken by the trawler *Active* in about 30 to 50 fathoms; it was attached to a stone.

Mucronella sp.—The specimen was found on an ascidian taken by the trawler *Active*. It resembles closely *M. coccinea*. It is an encrusting form; the zoëcia are ovoid, narrowing below, quite flat, the outline of each is very distinct, the surface plainly granular; the orifice is almost terminal, it is rounded above and widest near the base; there are two lateral denticles near the base and a median, blunt denticle on the lower lip; two avicularia are present at the sides of the orifice, their lower edge is below the edge of the lower lip of the peristome; they point upward or inward or between the two positions; there are generally three spines present just above the orifice; the zoëcium is yellowish and dim toward the base. In a second specimen got from a stone taken by trawler *Active*, each zoëcium was punctured around the border very close to the raised, separating ridge. Avicularia are constantly present, only a few having a single avicularium.

FAMILY: CRISIIDÆ.

Crisia eburnea—(Linnæus).—Specimens of this were found on the base of red algæ dredged in 20 fathoms; two small tufts, 1 cm. high from base of stem of *Boltenia*; several branches 2.5 cm. high from stone obtained in Chedabucto Bay; from a hydroid dredged in 20 fathoms at the entrance to Canso harbour; one small branch found attached to *Lafœa dumosa* dredged in 20 fathoms near Canso harbour; a magnificent branch 2.5 cm. high found growing on *Rhodymenia palmata* dredged in 20 fathoms. The joints are always horn-coloured, branches generally do not arise from lowest zoëcium of the internodes but more frequently from the second, third, fourth or fifth. In one specimen oëcia are present. They are always at the base of the branch and are very ventricose with orifice not projecting nor tubular, but transversely narrow elliptical.

FAMILY: TUBULIPORIDÆ.

Tubulipora flabellaris (Fabricius).—Colonies were found on *Laminaria* dredged in 10 to 15 fathoms. The young colonies are fan-shaped, the adult are almost orbicular; there is no sign of lobation in either young or adult.

Idmonea atlantica (E. Forbes).—One colony 2.5 cm. long was got on a muddy bottom in 25-35 fathoms. The branching is fairly regularly dichotomous. There were no oëcia present. Another colony .75 cm. high growing on *Lafœa dumosa* was got in the same locality.

Idmonea serpens, Linnæus.—Two small branches were found in an hydroid dredged in about 20 fathoms near the entrance to Canso harbour. Its colour is ivory white with no tinge of purple.

Entalophora clavata (Busk).—A small, erect colony less than 1 cm. high was found growing on an hydroid dredged at 20 fathoms. It sprang from the same base as a branch of *Idmonea*. It is unbranched but clavate at the end and resembles completely in form Hincks' illustration, Plate LXV., 8d. (Br. Mar. Polyzoa).

SESSIONAL PAPER No. 22a

FAMILY: LICHENOPORIDÆ.

Lichenopora, sp.—I was unable to identify this specimen with any species described by Hincks in 'British Marine Polyzoa.' One small colony was taken off *Rhodymenia palmata* dredged in 20 fathoms near the entrance to Canso Harbour. The specimen is not more than 2 mm. in diameter. The zoarium is stipitate widening above into a shallow cup. There is a wide bordering lamina entirely free and curved up so as to make the edges of the cup. Zoœcia are arranged irregularly with the intervening cavities, also arranged irregularly; many of the orifices have long acuminate projections, some of which are bifid. The characteristic feature of the specimen is the form of the zoarium.

Lichenopora verrucaria (Fabricius).—This is a common species at Canso. I found it on *Laminaria* fronds washed up on the beach, on a blade of dead *Zostera* that came up in the dredge from 30 to 40 fathoms and several colonies on *Ptilota plumosa* dredged from 15 fathoms.

FAMILY: FLUSTRELLIDÆ.

Flustrella hispida (Fabricius).—This is very commonly found between tide marks coating the stems of *Ascophyllum nodosum*. It is always situated at the base of the stipe.

FAMILY: VESICULARIIDÆ.

Bowerbankia, sp.—Specimens were found growing on hydroids attached to mussel shells taken under wharfs. The zoœcia are in groups attached to both sides of a jointed stolon. The polypide has eight tentacles, the stomach is quite dark coloured, the gizzard conspicuous and many cells contain rounded, dark brown bodies.

Bowerbankia imbricata (Adams).—A small mass was found growing on the surface of *Membranipora lineata* attached to a mussel shell. The majority of the polypides have a large, red, oval larva in each, and this is the only distinct organ that can be seen. One had its tentacles projecting in a long, pointed mass, they seem to be more than ten, but I could not tell the exact number. I am not at all sure of the identity of this specimen.

FAMILY: PEDICELLINIDÆ.

Pedicellina cernua (Pallas).—Both the smooth and spiny variety of this species occurred on mussel shells taken under wharfs. Variety *glabra* is the more common, only one specimen of the spiny form was found and the spines on this were long and hair-like, and were not confined to the peduncle, but also cover the polypides. I counted fourteen tentacles in several individuals.

Pedicellina nutans, Dalyell.—This was found intermingled with *Bowerbankia*, sp. on a mussel shell got from under a wharf, and also mixed with *Pedicellina nutans* growing on *Membranipora lineata* got from a mussel shell.

Pedicellina gracilis, Sars.—One specimen of this species was found spread over an encrusting mass of *Membranipora lineata* on a mussel shell, which was got under a wharf, it was intermingled with *Pedicellina nutans*, and the cells of the two were about the same size. The peduncle was very long and slender, the expanded, cylindrical part at the base being hardly one-eighth of the whole peduncle, but in a few cases as much as one-fourth. In some individuals the peduncle expands above to form a capitate head which contracts suddenly at the polypide. The polypides are plainly gibbous on the sides. The stolon is jointed.

FAMILY: LOXOSOMIDÆ.

Loxosoma singulare, Keferstein.—Two specimens were found on *Schizoporella*. Both have two buds of different sizes on each side. The stalk is about one-half the length of the body, transversely marked, but the expanded disk below is hid from sight. It only varies from Hinck's description by having eight tentacles in one specimen. The number in the other could not be counted.

Unidentified.—A specimen was found on a stone taken by the trawler *Active*. It formed a very small, white, encrusting mass; the zoœcia are arranged in very irregular order and their boundaries are not distinct; the orifice is arched above and convex below, due to a tubercle arising just below the orifice; this tubercle has two lateral wing-like outgrowths below and in this way forms a crescent-shaped body on the front surface of the zoœcium; dim radial lines pass out from this to the margin; two spines arise from the upper side of the orifice. Many have globular oœcia above, and on these the spines are absent.

Another species was found on a stone and on the shell of *Balanus* taken by trawl of the *Active*. The zoarium is encrusting and of a greenish colour; zoœcia are of average size, very plainly marked off from one another and of irregular and various shapes, the whole surface is flat and covered with very large punctures giving it a reticulated appearance. The orifice is not terminal but at the upper end, not projecting, and almost perfectly orbicular; some have two lateral denticles near the lower edge; directly below the orifice is an avicularium with pointed mandible running nearly horizontal, or obliquely upward.

IX

NOTES ON THE FISHES OF CANSO.

BY GEORGE A. CORNISH, B.A., TORONTO.

Science Master in the Collegiate Institute, Lindsay, Ontario.

The following notes refer to specimens of fishes collected and determined at the Marine Biological Station during July and August in the two seasons of 1901 and 1902. In nomenclature and classification Drs. Jordan and Evermann's 'Fishes of North and Middle America' has provided the authority followed. The specimens, it may be added, were collected mainly during the trips of the fishing steamer *Active*, operated by the Messrs. Whitman, of Canso, or were obtained along the shore, or in shallow water about the wharfs of the harbour, or in the areas thickly overgrown with eel-grass, adjacent to the laboratory. I visited several times each week the traps set for mackerel and squid in water about six fathoms in depth quite close to the land. The *Active* furnished most specimens, secured during her daily fishing trips, a few miles from the harbour, where trawls of hooks were set for cod and haddock. For about a month during 1901 the beam-trawl was used in Chedabucto Bay at a depth of 18 to 20 fathoms, with most noteworthy success. A few fish were kindly brought by some of the local fishermen from the 'Banks' and by some of the deep-sea fishermen who fish in small boats with handlines or with long lines of hooks known as 'trawls.' I cannot refrain from making special reference to the willing aid of Mr. C. H. Whitman, who most kindly compiled statistics regarding the local 'takes' of certain fishes of which I have made use, as well as for much other assistance during the whole course of the work of collecting specimens.

FAMILY: GALEIDÆ.

1. *Prionace glauca* (Linnaeus).—This species, called in the locality of Canso the 'Blue Dog,' is very common in the adjacent waters, and is reported by the cod fishermen to be extremely plentiful on the 'Banks.' Two specimens which I measured were 1,423 mm. and 1,437 mm. respectively from the tip of the snout to the concavity of the tail. In one there were three gills upon one side atrophied. They are stated to die upon the trawl hook more quickly than the cod or the picked dog-fish (*Squalus acanthias*), so that they are rarely brought on deck alive. The fishermen think that when they take the hook they are unable to close the mouth, and thus drown. I have seen one come to the surface when out fishing with the hook trawl, and after it had snapped off a cod-fish from the trawl it would circle round, with its dorsal fin exposed, and rapidly gather up the fragments, an occurrence which I am informed is very common on the fishing grounds. An examination of the stomach showed a few shrimps only, and in the longitudinal spiral valve were many specimens of a tape-worm.

FAMILY: SQUALIDÆ.

2. *Squalus acanthias*, Linnaeus.—This is an extremely common species, and often a great nuisance to the fishermen fishing with trawls of baited hooks. I have known gear with 700 hooks to have 690 of these dog-fish upon it. No use is generally made of these fish; they are difficult to release from the hooks, and they generally snap off

6-7 EDWARD VII., A. 1907

the snood; they are regarded with much disfavour. As Professor Prince pointed out in his report on the 'Dogfish Pest in Canada' (Fisheries Report, Department of Marine and Fisheries, Ottawa, 1903), this species has proved a most destructive enemy to the sea fishermen's pursuits, and his recommendations to the government favouring reduction works for converting dogfish into fertilizer, oil, glue, &c., are now being carried out.

FAMILY: RAIIDÆ.

3. *Raia ocellata*, Mitchill.—A most common species at Canso, though some of the specimens which I examined may belong to the allied species *R. erinacea*. I found it difficult to decide finally in the case of some examples. They were all taken in trap-nets set for mackerel, close along the shore. I give the following details in regard to four specimens:—

Length.	Number of Teeth.	Sex.	Ocelli.
700 mm.	78 85	Male.....	Not distinct.
689 mm.	69 77	Female.....	Absent.
715 mm.	91 90	".....	Present.
610 mm.	71 73	Male.....	Absent.

The last-named specimen exhibited several rows of spines along the tail, which would indicate that it is *R. ocellata*; but in it and in the second specimen the number of teeth present is intermediate between the diagnostic dentition of the two species. In the two male specimens the double row of erectile spines points inward to the middle line rather than backward. In none of those in which ocelli are present is there any central dark spot. Their food was found to be dollar fish (*Poronotus triacanthus*), the cunner (*Tautogolabrus adspersus*) and squid, remains of which occurred in the contents of the stomach.

4. *Raia lævis* (Mitchell).—This species is frequently captured by the cod fishermen on their deep-sea trawls of hooks. The only specimen minutely examined by me was 1,075 mm. long. In colour it was light-brown dorsally, with scattered dull black spots. There were two large ocelli surrounded by a black ring; ventrally, it exhibited small black spots; some of them were arranged in two rows.

5. *Raia radiata*, Donovan.—This skate or ray is usually called the Starry Ray, and it is the most common species taken on the local cod-trawls. Hence Drs. Jordan and Evermann are not perfectly accurate, so far as eastern Nova Scotia is concerned, in saying that this species is not common on the Atlantic coast. I have seen several dozens taken in about three hours by one dory. Nor are the American authorities accurate as to the size, as I have seen half a dozen amongst an afternoon's catch on board a dory each of which exceeded three feet in length. Two that I measured accurately were 994 mm. and 1,126 mm. long, the former being a female and the latter a male. The fishermen informed me that they secure very frequently specimens of the dimensions just specified. On two small specimens (145 mm. long) taken in the dredge the lateral spines on the tail were quite rudimentary. A large spine was present just

SESSIONAL PAPER No. 22a

behind the spiracle in the specimens examined. In one large specimen I noticed a row of transverse black lines on each side dorsally and running backward almost parallel, but on the tail approaching and becoming obscure.

Of the Teleosteans, or bony fishes, specimens embracing fifty-one species passed under my examination, and in regard to these the following notes were prepared:—

FAMILY: ANGUILLIDÆ.

1. *Anguilla chrysypa*, Rafinesque.—Specimens of the common eel are plentiful in the long eel-grass inshore and in shallow water. They are caught in traps and eel-pots. The young, less than 10 cm. in length, are also found in shallow water near the shore.

FAMILY: CLUPEIDÆ.

2. *Clupea harengus* (Linnaeus).—The common herring is not abundant and is not commercially important. A few are taken from the trap-nets, but never more than a barrel or two. They varied in length from 189 mm. to 235 mm.

3. *Pomolobus pseudoharengus* (Wilson).—This species, called locally the Alewife or Gaspereau is taken in small quantities in the trap-nets, but is commercially unimportant.

FAMILY: SALMONIDÆ.

4. *Salmo salar* (Linnaeus).—Young specimens about 230 or 250 mm. in length are commonly taken in the early summer, and adults are caught in spring and early summer.

FAMILY: ARGENTIDÆ.

5. *Osmerus mordax* (Mitchell).—The smelt is common, though not found in the vast quantities which occur in the more northern estuaries. It is caught by hook and line from the wharfs, and in the trap-nets. Owing to the limited quantities taken, none are shipped from Canso to the markets as a rule.

FAMILY: PŒCILIIDÆ.

6. *Fundulus heteroclitus* (Linnaeus).—The common killifish is plentiful in brackish ponds near the beach at Canso.

FAMILY: SCOMBRESOCIDÆ.

7. *Scombrosox saurus* (Walbaum).—Large schools of this species can often be seen skipping over the water trying to escape from the voracious pollack. A few are caught in the trap-nets, and on one occasion a specimen was washed on board the tug during one of our scientific trips in the bay.

FAMILY: GASTEROSTEIDÆ.

8. *Pygosteus pungitius* (Linnaeus).—In one pond near the seashore this small fish is very common; but, curiously enough, it is entirely absent from another pond quite similar in its physical features, and practically adjoining.

9. *Gasterosteus bispinosus* (Walbaum).—This species is abundant in tidal pools and in ponds near the beach. They seem to be of two sizes, with no intermediate links. Those of larger size are 53-60 mm. in length, and are confined to the tidal pools, while

6-7 EDWARD VII., A. 1907

the smaller specimens, 20-26 mm., are found both in the tidal pools and in the brackish water ponds, and in both sizes the genital organs were found to be mature. I made accurate measurements of seven examples, and found that, in three of them, the first dorsal spine does not reach the second, in one the tip just touches the base of the second, and in three it projected beyond the base of the second. The ratio of length to height in the seven are 4·3, 4·1, 3·8, 4·2, 4·3 and 4·9, hence the distinction which has been drawn between *G. spinosus* and *G. aculeatus* does not hold in the case of the Canso specimens. I made some endeavour to decide if other peculiarities could be correlated with the red throat and red fin membrane which many exhibited. Out of 245 specimens collected from the pond, 16 were distinctly red-throated, and 8 red-throated specimens examined were found to be males with active spermatozoa in the testes. Out of 10 with pale throat 5 were females and 5 proved to be males showing active spermatozoa.

10. *Apeltes quadracus* (Mitchell).—This species was common in a brackish pond near the beach. The head I found to be contained 4·3 times in length, and the depth 4·3-4·8 in the length. The anal spine does not come under the third dorsal ray, but under the fourth, fifth or even under the seventh. In a large number the ventral fins have orange-red membranes, and sometimes the membrane of the dorsal and the anal spines are red. All with coloured membranes I ascertained to be males, and seven specimens not so tinted were females. I could detect no external marks of difference in the colouration of males and females excepting the red membranes. The dorsal spines are bent irregularly to the right and left, and in about one-third of the examples obtained the dorsal spines were four in number.

FAMILY : SCOMBRIDÆ.

11. *Scomber scombrus* (Linnæus).—Of this valuable food-fish variable quantities are captured by gill-nets and traps. They are usually shipped fresh to the Canadian markets, the fishermen receiving two to ten cents a piece for them, and the fishing season lasts from May to November. In one season recently over 250,000 mackerel were taken by Canso fishermen.

12. *Thynnus thynnus* (Linnæus).—The mackerel traps often capture specimens of this large species about the end of July and in the month of August. They are often called by the erroneous names, mackerel shark or horse-mackerel, the former being really the porbeagle (*Lamna*) and the latter the scad (*Trachurus*). The name tunny is correct and most appropriate, and in the Mediterranean sea it is one of the principal fisheries pursued, while in Japan it is an esteemed food-fish, raw, salted, smoked and canned in oil. At Canso they are occasionally captured, but one trap in a few weeks took over forty. All were liberated, as there is no market for them. They are often seen swimming near the surface of the sea.

FAMILY : AMMODYTIIDÆ.

13. *Ammodytes americanus* (DeKay).—This species was found only at one point at Canso. On a sandy beach at the entrance of a cove connected with Canso harbour they occurred very numerously at low tide. The drag seine used at this place on being hauled in quickly captured many hundreds in a short time. They were often found stranded on the shore as the tide went out, and were also dug out of the sand at a depth of six inches. They appeared to be of two sizes, without intervening stages. Twenty-five of the larger ranged from 157 mm. to 184 mm. in length, and ninety of the smaller type were found to measure 60 mm. to 89 mm. in length. The stomach was often empty; but when filled contained small crustacea, some of which were not secured in the immediate locality, and did not appear to occur locally.

SESSIONAL PAPER No. 22a

FAMILY: XIPHIIDÆ.

14. *Xiphias gladius* (Linnæus).—This species while not one of the common species captured at Canso, is at times taken in the trap-nets. One was secured in that way in 1901, and one in 1902 came to my notice. A demand has arisen for these fish commercially, and they have a high reputation in the United States markets, and being of large size (200 to 400 pounds being a frequent range of their weight) the fishery might become a remunerative one were it developed.

FAMILY: CARANGIDÆ.

15. *Decapterus macarellus* (Cuv. and Valenciennes).—Two specimens of this species were caught in the Chedabucto Bay trap-nets. They were wholly unfamiliar to the fishermen, and are apparently rarely seen at Canso.

16. *Trachurops crumenophthalmus* (Bloch)?—Two specimens were taken in the trap-nets by local fishermen, to whom the fish was unknown before. The specimens were found to differ from the description of Drs. Jordan and Evermann in two respects,—there are no scales on the cheeks, and, along the side, a bright golden-yellow band passes longitudinally below the lateral line anteriorly; but about midway it crosses and then passes back above the lateral line.

FAMILY: CENTROLOPHIDÆ.

17. *Palinurichthys perciformis* (Mitchell).—The fishermen call this species the 'Rudder fish,' and are familiar with it, as they state that it follows their sailing vessels into port from the 'Banks.' One specimen was taken by hook at the Canso wharf.

FAMILY: STROMATEIDÆ.

18. *Poronotus triacanthus* (Peck).—This small silvery fish is fairly common, and is frequently captured in the trap-nets.

FAMILY: SERRANIDÆ.

19. *Roccus lineatus* (Bloch).—Young specimens 170 mm. long of this fine fish, which when adult may measure 3 to 5 feet in length and weigh from 20 to 100 pounds, are frequently caught by boys with hook when fishing for smelt.

FAMILY: LABRIDÆ.

20. *Tautogolabrus auspersus* (Walbaum).—An excessively abundant fish about the wharfs. It is very variable in size and colour, and is popularly known as the perch or cunner.

FAMILY: BALISTIDÆ.

21. *Balistes carolinensis* (Gmelin).—One specimen of this remarkable File-fish was brought in by the deep-set fishermen, who stated that it was 'gaffed' on Banquereau Bank, about fifty miles southeast of Canso. It was seen near the surface swimming around a floating buoy. Its captors had never seen one before, and it may be added that while the members of the family are abundant in tropical seas they become very scarce in higher latitudes.

FAMILY: MOLIDÆ.

22. *Mola mola* (Linnæus).—The sun-fish, as it is called all over the Atlantic waters of Europe and this continent, is not uncommon at Canso and out on the 'Banks.' Specimens even come close to the beach, and one was driven ashore by the fishermen with oars and gaffs, and was brought to the station. Another example was also obtained, and the measurements of each respectively were 1,480 mm. long and 1,780 mm., vertically from the tip of the dorsal to the tip of the anal fin, in the first, and 1,790 mm. long and 2,020 mm. vertical measure, in the second. The stomach of one was empty, while in the other were found two squid.

FAMILY: SCORPÆNIDÆ.

23. *Sebastes marinus* (Linnæus).—A few specimens of this fish called locally 'Red Perch' or 'Gale fish,' or more widely the 'Norway haddock,' are taken on every trawl of hooks, but no use is made of them. They frequent a soft bottom at the base of the slope from shallow to deep water at about 60 fathoms. I found that neither the pectoral nor ventral fins are long enough to reach the anus.

FAMILY: COTTIDÆ.

24. *Triglops pingeli* (Reinhardt).—A specimen swept into the beam-trawl net at 18 fathoms depths in Chedabucto Bay was 78 mm.; and in several respects it differed from the description given by Drs. Jordan and Evermann. The series of spines along the base of the dorsal fin is continued to the caudal fin; but from the middle of the second dorsal fin the spines are small and not obvious. Dorsally it is light greenish-brown, mottled with a light reddish shade of the same colour. There are four dark saddles across the back; an interrupted black line runs along the side; there is no ocellus on the anterior dorsal fin. Each of the dorsal fins exhibits three black lines, while the pectoral fin has four dark bars and the anal fin is white. A distinct dark line runs below the eye on each side of the head.

25. *Myoxocephalus grænlandicus* (Cuv. and Valenciennes).—This species is exceedingly common in shallow water, and shows great variation in colour. It ranges in length from 130 to 170 mm.

26. *Myoxocephalus octodecimspinosus* (Mitchill).—Several specimens were taken in the beam-trawl net in 18 fathoms of water on a sandy bottom in Chedabucto Bay. In one example, 201 mm. long, the soft dorsal fin had a short anterior spine; but possibly this feature was not normal, as in two smaller specimens it was absent. In the same large specimen the preopercular spine does not extend so far as the opercular spine; but this does not apply to the two smaller examples.

27. *Hemitripterus americanus* (Gmelin).—This is a very common fish at Canso, and as a rule called the 'Sculpin.' It occurs at depths of a few feet down to 50 or 60 fathoms, and varies most remarkably in colour; some are bright red, others dark brown, and there are intermediate shades. The brilliant-red specimens generally occur in deep water; but the dark-brown type occurs at all depths. Large specimens are taken, the largest being no less than 511 mm. long. They are used as bait in the lobster traps with other rejected or 'offal' fish.

FAMILY: AGONIDÆ.

28. *Aspidophoroides monoptygius* (Bloch).—The beam-trawl net secured several specimens in Chedabucto Bay at a depth of about 18 fathoms.

SESSIONAL PAPER No. 22a

FAMILY: CYCLOPTERIDÆ.

29. *Cyclopterus lumpus* (Linnæus).—This fish, generally known as the lumpfish, lumpsucker, or in Scotland the 'paidle,' is plentiful at Canso in the spring; but much scarcer in summer. I examined one specimen caught by a fisherman on his baited hook while fishing for pollack. The colour appears to fade very quickly from the slimy skin after death.

FAMILY: BLENNIIDÆ.

30. *Pholis gunnellus* (Linnæus).—This eel-like familiar fish, often called the Gunnel or Butterfish, is very common under stones at low water, and eludes capture by reason of its exceedingly slimy, slippery integument.

31. *Stichæus punctatus* (Fabricius).—One specimen of this peculiar blenny was found in the beam-trawl net when fishing in 18 fathoms of water in Chedabucto Bay on a sandy bottom. Another was obtained in a moribund condition under a wharf. The markings differ very much from the description of Drs. Jordan and Evermann. There is no tinge of scarlet; but the colour is light-brown above, whitish-yellow below, while black blotches occur dorsally, and eight or nine large irregular brownish blotches on the sides. There are twelve black spots on the anal fin. The blotches on the side are somewhat indistinct in one of the specimens.

32. *Ulvaria subbifurcata* (Strong).—Four specimens of this species were obtained. One was found under some stones on the beach, when looking for gunnel or butterfish, while two were brought up in the dredge in 6 to 10 fathoms of water, and the fourth was taken in the beam-trawl net in the bay in 30 fathoms of water. It would appear, therefore, not to be wholly a deep-water fish, and I may add that there can be no doubt as to my identification of the specimens.

FAMILY: CRYPTACANTHODIDÆ.

33. *Cryptacanthodes maculatus* (Storer).—This rather uncommon fish is taken on the hooks of the haddock-trawls at about 20 fathoms depth. It is often called the Lamper-eel, in common with *Zoarces* the viviparous blenny. All the specimens in my hands were dark in colour; the lateral line was distinct, showing about 140 pores, and the colouring is lighter along this line.

FAMILY: ANARHICHADIDÆ.

34. *Anarhichas latifrons* (Steenstrup and Hallgrímsson).—One very large specimen of the wolf-fish was taken on the trawl of the steamer *Active* in about 50 fathoms. I learned that not more than one or two specimens are secured in a season, so that it is not a common fish. Its length was 1,166 mm., or including the caudal fin to its final margin, 1,240 mm. The shape of the fish differed very much from that given by Drs. Jordan and Evermann, as the abdomen was far more prominent, the vertical depth being contained three times in the length. The mouth for so large a fish seemed small, and the vomerine teeth extended within one centimetre of the posterior palatines. The American authorities referred to are certainly in error in stating as a generic character the presence of an air-bladder. There is no sign of such an organ in this species or in the Sea-cat, *A. lupus*. The dorsal fin is continuous with the caudal fin; but becomes very much narrowed as it approaches the caudal. This fish is of a dark-brown chocolate colour, obscurely mottled. Four sea-urchins, 45 to 60 mm. in diameter, were found intact in the stomach, except that the spines were detached.

35. *Anarhichas lupus* (Linnæus).—This species is common at Canso, and almost every trawl of hooks brings up a few. The local fishermen call it 'Catfish,' as they do

in Britain, and they are loud in its praises as an edible fish, though it is treated as 'offal' fish. I took from the stomach gastropod and lamellibranch shells, hermit crabs, sea-urchins, and the much branched *Astrophyton*.

36. *Anarhichas minor* (Olafsen).—Occasional specimens, differing from the two foregoing species, are occasionally brought in by the fishermen, and appear to belong to this species. Like *A. latifrons* this is usually regarded as a purely Arctic wolf-fish.

FAMILY: ZOARCIDÆ.

37. *Zoarces anguillaris* (Beck).—This species appears to be common at about 20 fathoms depth, and is constantly caught by the trawl hooks or in the beam-trawl net. The usual name for it at Canso is Rock-eel or Lamper-eel. There are great variations in the relative dimensions of the head, pectoral fin and abdomen, and in the thickness of the lips. I noticed that the first ray of the dorsal fin is generally behind the line of the preopercle, and not above it.

38. *Lycodes*, sp.—Three specimens were taken on the trawl-hooks of the steamer *Active* at a depth of about 50 fathoms where the bottom is sandy. The fishermen declare that it is sometimes taken on the 'Banks;' but they appear to have no popular name for it. One man called it the 'Laughing Jack.' It seems to correspond with no species described by Drs. Jordan and Evermann, and I therefore give my notes on the specimens in detail:—

	Specimen No. 1.	Specimen No. 2.
Length.	662 mm.	656 mm.
Head.	166 mm.	160 mm.
Depth.	87 mm.	90 mm.
Width of eye.	22 mm.	18 mm.
Interorbital space.	26 mm.	26 mm.
Snout.	57 mm.	60 mm.
Pectoral fin.	94 mm.	94 mm.
Ventral fin.	14 mm.	15 mm.
Dorsal fin.	96 rays
Anal fin.	69 rays
Pectoral fin.	18 rays	18 rays
Upper jaw, length.	84 mm.
Lower jaw, length.	54 mm.
Base of ventral to anus.	166 mm.
Depth at anus.	75 mm.
Distance between nostrils.	30 mm.
Distance from eye to nostril.	38 mm.
Highest dorsal ray.	39 mm.
Highest anal ray.	30 mm.

The head is very wide and flat, while the body is compressed and tapers backward to a point. The jaws have very wide flaps, which on the upper jaw project very much. A fold of skin on the chin runs parallel with the edge of the lower mandible and ends in a free laterally compressed flap. The lower jaw is included. The teeth are all conical, and are found on the upper and lower jaws, palatines, and vomer. In the upper jaw there is one row supported at the front by two or three small teeth on a posterior row; the vomerine teeth form a small transverse oval patch; the palatines form a single row on each side diverging posteriorly; in the lower jaw there are three rows for a short distance anteriorly and one row follows posteriorly; the row of maxillary teeth is 35 mm. long, palatines 29 mm., vomerines 9 mm. × 4 mm., mandibular 55 mm. long. The dorsal fin commences about 2 cm. behind the pectoral; the dorsal and anal unite around the caudal; both are highest at the anterior, tapering posteriorly; the ventral fins are conical, almost teat-like. Scales are present on the sides of the body, beginning a little behind the pectoral fin, and are round, cycloid, the

SESSIONAL PAPER No. 22a

largest being about 1 mm. in diameter; they are imbedded in skin, the spaces between them being about two diameters. The dorsal and anal fin are scaly to the free margin behind, but the distal part is naked anteriorly. The head, part of the nape, sides of body for 2 cm. behind the pectorals, the abdomen, pectoral and pelvic fins are scaleless. The ground colour is a greenish-yellow except on the chin, throat and pectoral fins, which are whitish, the latter becoming dusky toward the tips. The sides and top of the head are reticulated with black, passing just in front of the top of the gill-slit; over the top of the head from side to side is a light, conspicuous band of the ground colour bounded at the edges by a wavy, black line; about nine wide, black, transverse bands pass across the sides, and are extended into the dorsal fin, where they are lost; these black bands become less distinct posteriorly, and do not extend to the ventral surface; each band consists of a reticulation of black on a green back-ground. It is quite unlike the reticulations of *L. reticulatus*, as the black is not in narrow lines but in bands of 5 to 10 mm. in width. The dorsal fin is edged with darker, the anal fin has scattered shades of dusky most marked posteriorly. There are indications of the median lateral line on the last 150 mm. of the tail.

FAMILY: GADIDÆ.

39. *Pollachius virens* (Linnæus).—This is one of the most abundant food-fishes at Canso, 500,000 pounds being the annual catch. It is captured usually with hook and line in the surface waters from June to December. A few, however, are brought up on the hooks of cod-trawls from 30 to 50 fathoms. On being brought to the wharf, the head is removed and the backbone excised. They are then salted and shipped to the West Indies. The fishermen receive from one-half to one cent per pound for their pollack.

40. *Urophycis tenuis* (Mitchill).—This species of hake, commonly called 'Squirrel hake' by the fishermen, is captured occasionally on the cod-trawl hooks on muddy bottoms. One specimen carefully examined by me varied considerably from the description of Drs. Jordan and Evermann, and I therefore detail the measurements: Length, 865 mm.; depth, 215 mm.; orbit, 36 mm.; snout, 63 mm.; inter-orbital space, 58 mm.; length of pectoral fin, 144 mm.; head, 235 mm.; length of filamentous dorsal ray filament, 85 mm.; rays of dorsal fin numbered 11, 54, the rays of the anal fin 50, of the pectoral fin 15, of the ventral fin 4. Twelve rows of scales occurred between the lateral line and the anterior dorsal fin; the number of scales along the lateral line is 130. The head as shown by the examination of several other specimens was found to be contained less than four times in the length, and the depth to be contained less than five times in the length. I may add that the term 'Squirrel hake' may be applied to any small hake.

41. *Enchelyopus cimbrius* (Linnæus).—Two specimens were secured by the beam-trawl in 30 fathoms of water in Chedabucto Bay.

42. *Gadus callarias* (Linnæus).—The cod is of course a supremely important fish of Canada. The fishing season extends throughout the year, and about 3,566,000 pounds of this fine food-fish, for which the fishermen receive from $\frac{3}{4}$ to 2 cents per pound, are taken annually. 1,000,000 pounds are salted and dried, 1,000,000 are salted, 1,000,000 pounds are shipped fresh packed in ice, and 500,000 pounds are shipped fresh frozen. The fresh fish supplies the market for Canada, and the salted is disposed of in Canada and the West Indies.

43. *Melanogrammus æglefinus* (Linnæus).—About 3,000,000 pounds of this fish are taken annually at Canso. 400,000 pounds are smoked and 25,000 pounds are salted; 25,000 pounds are salted and dried, 2,000,000 pounds are shipped fresh packed in ice, and 550,000 pounds are shipped fresh frozen. The fresh and smoked are consumed in Canada, the salted in Canada and the West Indies and the dried in the West Indies.

6-7 EDWARD VII., A. 1907

Fishermen receive one-half to two and a half cents per pound. They are caught throughout the year.

FAMILY: PLEURONECTIDÆ.

44. *Hippoglossus hippoglossus* (Linnæus).—This is a very important food-fish. The size varies from a few pounds to two hundred or even more dressed. They are caught with hook and line and on the trawls. Those with the lower surface white are considered much better than those with a duller colour, and bring a much better price. 300,000 pounds are caught annually, which is shipped fresh to the Canadian market. Fishermen receive from 1 to 10 cents a pound. They are caught throughout the year.

45. *Reinhardtius hippoglossoides* (Walbaum).—This fish is not uncommon at Canso. It is taken on the trawl on muddy bottom in about 50 fathoms or deeper. It is here called the 'Turbot,' and is considered good eating. The anal and dorsal fins are scaled, and the number of canines in upper jaw varies, one having two on right side and three on left; another has two on right side and one on left side.

46. *Hippoglossoides platessoides* (Fabricius).—This is a very common fish on the trawls, and is only occasionally marketed. Very many young specimens from 4 or 5 cm. to 25 cm. long were taken in the beam-trawl at 20 fathoms in Chedabucto Bay. The young specimens have characteristic markings; along the dorsal margin are three distinct large, black, round ocelli, and on the ventral margin are four ocelli; other smaller fainter spots are also seen on the margins.

47. *Limanda ferruginea* (Storer).—A few specimens were got in the beam-trawls from 20 fathoms in Chedabucto Bay.

48. *Pseudopleuronectes americanus* (Walbaum).—This is the common flat fish of shallow water. It is seen under wharfs, in eel-grass, and a few were captured every day in the trap-nets. Many were taken by beam-trawl in 20 fathoms.

49. *Glyptocephalus cynoglossus* (Linnæus).—A few of these were got by the beam-trawl in Chedabucto Bay. The fishermen call it the 'Lemon Sole' or the 'Fluke.'

50. *Lophopsetta maculata* (Mitchell).—One specimen 230 mm. long was got from a thap-net and two or three were got by the beam-trawl in Chedabucto Bay.

FAMILY: LOPHIIDÆ.

51. *Lophius piscatorius* (Linnæus).—This fish is obtained very commonly on the hooks of the long trawls in deep water and at moderate depths.

X

PRELIMINARY REPORT ON THE TREMATODES OF CANADIAN
MARINE FISHES.

BY J. STAFFORD, M.A., PH. D.

(McGill University, Montreal.)

The worms that live parasitically upon the surfaces or in the cavities or tissues of our fishes may be distributed into six groups :—

1. Turbellaria.
2. Trematoda (Sucker worms).
3. Cestoda (Tape worms).
4. Nematoda (Thread worms).
5. Acanthocephala (Hook-headed worms).
6. Hirudinea (Leeches).

Excepting the first, each of these groups is represented by numerous different kinds as will be indicated in this brief account by the enumeration of the species of Trematodes hitherto observed at the biological station, with an appended list of their hosts. The Trematodes are commonly divided into (1) Ectoparasitic Trematodes, or those that live on the skin or gills, and (2) Endoparasitic Trematodes, or those that occupy some internal organ. The first are generally the more active, often possessing such special sense organs as eyes; are well adapted, by flatness of form in the larger species, and especially by the presence of suckers or hooks, to their habit of clinging to the surfaces of their hosts; are most closely affiliated by organization with their nearest relatives among free-living worms; and develop from eggs by a direct and gradual process of growth. The second are generally more quiescent, having no special sense organs; are more completely adapted to life in an internal organ; possess typically two suckers (sometime only one) and no hooks; and develop primarily from eggs, but by a long, often complex series of transformations. The parasite during these transformations lives at one stage in such an animal as a snail (intermediate host), and at a later stage in a fish (final host) which has eaten the snail and in which the worm now comes to full development and produces eggs.

The life-histories of the species catalogued below are not known to me and are matters for future research, but from what is known of others we may anticipate that the eggs of an ectoparasitic Trematode are deposited where it lives, on the gills or skin of a fish. The embryos develop in the egg-shells or capsules which finally burst, and then the young animals either remain on the same host or swim about for a short time. In the latter case they may spread to new hosts, especially if a school of fishes is in proximity, and settle down to the mode of life of their ancestors.

With the endoparasitic Trematodes it is different. Each worm retains in its long uterus an enormous number of eggs, only the first-formed or oldest of which are from time to time deposited in the organ of the host occupied by the worm (intestine, gall-bladder, urinary-bladder, &c., of a fish) and make their way out with the excrements. When the eggs reach the sea water their contained embryos are already advanced in organization, being provided with locomotory cilia and eye-spots; and, upon bursting the shells, are capable of spending a brief existence as free-swimming larvæ (Mir-

6-7 EDWARD VII., A. 1907

acidia). During this time they must find suitable hosts (snails, annelids, crabs, &c.), into the soft parts of which they penetrate. Here they remain immature, but their locomotory and sense organs degenerate, and they become so far transformed and so entirely different from either the free-living miracidium or the mature adult as to be completely unrecognizable, in which case the specific identity can only be made out by finding intermediate stages. It may also happen that the larva in the snail (called a sporocyst) does not transform directly or slowly into the adult form, but by a kind of internal budding produces clusters of cells that develop into new individuals, the old individuals becoming disintegrated and destroyed. The primary intermediate host may, in some cases, serve as food to a secondary intermediate host, which in its turn falls prey to the final host, in each case the parasite suffering a change of environment. Sooner or later—but always in the definitive host (a fish)—the parasite reaches its final development, becoming sexually mature and producing eggs.

The list of species studied at the Marine Biological Station in the course of my investigations is as follows—

I. TURBELLARIA.

1. *Micropharynx parasitica* Jägerskiöld.
(=*Pseudocotyle fragile* Olsson). On the skin of the barn-door skate, *Raja laevis* Mit.

II. ECTOPARASITIC TREMATODES.

1. *Tristomum mola*, Blanchard. On the skin of the sun-fish (*Mola mola* L.).
2. *Tristomum coccineum*, Cuvier. On the gills of the sword-fish (*Xiphias gladius* L.).
3. *Epibdella hippoglossi*, O. F. Müller. Skin of halibut (*Hippoglossus hippoglossus* L.).
4. *Acanthocotyle verrilli*, Goto. Skin of starry-ray (*Raja radiata* Don.).
5. *Pseudocotyle apiculatum*, Olsson. Skin of dog-fish (*Squalus acanthias*, L.).
6. *Udonella caligorum*, Johnston. Attached to tails of specimens of *Caligus* which are themselves parasitic crustacea on the skin of the cod-fish (*Gadus callarias* L.).
7. *Octocotyle scombri*, Kuhn. Gills of mackerel (*Scomber scombrus* L.).
8. *Dactylocotyle denticulatum*, Olsson. Gills of pollack (*Pollachius virens*, L.).
9. *Dactylocotyle phycidis*, Parona et Perugia. Gills of hake (*Phycis chuss* Walb.).
10. *Anthocotyle merlucii*, van Beneden et Hesse. Gills of silver hake (*Merluccius bilinearis* Mit.).
11. *Onchocotyle abbreviata*, Olsson. Gills of dog-fish (*Squalus acanthias*, L.).

III. ENDOPARASITIC TREMATODES.

1. *Distomum veliporum*, Creplin. In the oesophagus, stomach, and intestine of the barn-door skate (*Raja laevis* Mit.).
2. *Derogenes varicus*, O. F. Müller. Mouth, oesophagus, stomach of—
Salmon (*Salmo salar* L.).
Cod (*Gadus callarias* L.).
Haddock (*Melanogrammus aeglefinus* L.).
Pollack (*Pollachius virens* L.).
Herring (*Clupea harengus* L.).
Smelt (*Osmerus mordax*, Mit.).
Rose-fish (*Sebastes marinus* L.).

SESSIONAL PAPER No. 22a

- Eel (*Anguilla anguilla* L.).
 Wry-mouth (*Cryptacanthodes maculatus* Storer).
 Sculpin (*Acanthocottus scorpius*, L.).
 Sea raven (*Hemitripteris Americanus* Gmelin).
 Angler (*Lophius piscatorius*, L.).
 Halibut (*Hippoglossus hippoglossus* L.).
 Sand dab (*Limanda ferruginea* Storer).
 Greenland turbot (*Platysomatichthys hippoglossoides* Walb.)
 Rough dab (*Hippoglossoides platessoides* Fab.).
3. *Hemiurus appendiculatus*, Rudolphi. Oesophagus and stomach of—
 Salmon (*Salmo salar* L.).
 Smelt (*Osmerus mordax*, Mit.).
 Herring (*Clupea harengus* L.).
 Cod (*Gadus callarias* L.).
 Pollack (*Pollachius virens*, L.).
 Sand lance (*Ammodytes tobianus* L.).
 Eel (*Anguilla anguilla* L.).
 Sculpin (*Acanthocottus scorpius*, L.).
 Halibut (*Hippoglossus hippoglossus* L.).
 Greenland turbot (*Platysomatichthys hippoglossoides* Walb.)
4. *Lecithaster bothryophorus*, Olsson. (= *Apoblema mollissimum* Levinson).
 Intestine of—
 Salmon (*Salmo salar* L.).
 Herring (*Clupea harengus* L.).
5. *Distomum simplex*, Rudolphi. Intestine of—
 Salmon (*Salmo salar* L.).
 Rose-fish (*Sebastes marinus* L.).
 Stickleback (*Gasterosteus aculeatus* L.).
 Hake (*Phycis chuss* Walb.).
 Mackerel (*Scomber scombrus* L.).
 Sculpin (*Acanthocottus scorpius*, L.).
6. *Stephanochasmus sobrinus*, Levinsen. Rectum of—
 Sea raven (*Hemitripteris Americanus* Gmelin).
 Wry-mouth (*Cryptacanthodes maculatus* Storer).
 Lycodes sp.
7. *Stephanochasmus hystrix*, Desjardins. Encysted on fins of Winter flounder (*Pseudopleuronectes americanus*, Walb.).
8. *Deropristi inflata*, Molin. Small intestine of Eel (*Anguilla, anguilla* L.).
9. *Distomum rachion*, Cobbold. Intestine of Haddock (*Melanogrammus aeglefinus*, L.).
10. *Distomum furcigerum*, Olsson. Stomach and intestine of—
 Winter flounder (*Pseudopleuronectes americanus*, Walb.).
 Greenland turbot (*Platysomatichthys hippoglossoides*, Walb.).
 Rough dab (*Hippoglossoides platessoides*, Fabr.).
 Wry-mouth (*Cryptacanthodes maculatus*, Storer).
11. *Lepidophyllum steenstrupi*, Odhner. Urinary bladder of—
 Wolf-fish (*Anarrhicus lupus*, L.).
 Eel-pout (*Zoarces anguillaris*, Peck).
12. *Distomum incisum*, Rudolphi (= *Distomum fellis*, Olsson). Gall-bladder of—
 Wolf-fish (*Anarrhicus lupus*, L.).
13. *Distomum fragile*, Linton. Intestine of Sun-fish (*Mola mola*, L.).
14. *Accacoelium contortum*, Rud. Gills of Sun-fish (*Mola mola*, L.).
15. *Accacoelium macrocotyle*, Diesing?. Intestine of Sun-fish (*Mola mola*, L.).

16. *Gasterostomum armatum*, Molin. Cæca and duodenum of—
 Sculpin (*Acanthocottus scorpius*, L.).
 Sea-raven (*Hemitripterus americanus*, Storer).
 Cusk (*Brosmius brosme*, Müller).
 Halibut (*Hippoglossus hippoglossus*, L.).
17. *Distomum* sp. (Linton, 1901, Plate XXXII., f. 359.) Intestine of—
 Halibut (*Hippoglossus hippoglossus*, L.).
 Sea-raven (*Hemitripterus americanus*, Storer).
18. *Distomum* sp. (Linton, 1901, Plate XXXII., f. 354.) Stomach and intestine of Killifish (*Fundulus heteroclitus*, L.).
19. *Distomum*, sp., an undescribed species. Intestine and cæca of Halibut (*Hippoglossus hippoglossus*, L.).
20. *Distomum*, sp., an undescribed species. Urinary bladder of Wolf-fish (*Anarrhicas lupus*, L.).
21. *Distomum*, sp., an undescribed species. Intestine of Wolf-fish (*Anarrhicas lupus*, L.).
22. *Distomum*, sp. (appendiculate). Intestine of Angler (*Lophius piscatorius*, L.).
23. *Distomum*, sp. (immature).—In black, fibrous cysts in stomach-wall of Angler (*Lophius piscatorius*, L.).
24. *Distomum*, sp. (immature). Encysted in skin of Cunner (*Ctenolabrus adersus*, Walb.).
- To this list may be appended:—
Distomum, sp. (immature). Intestine of the Squid (*Ommastrephes illecebrosa*).
Distomum, sp. (immature). In the parapodia of an Annelid, *Nereis virens*.

MONTREAL, February, 1903.

XI

THE EGGS AND EARLY LIFE-HISTORY OF THE HERRING, GASPÉREAU, SHAD AND OTHER CLUPEIDS.

BY PROFESSOR EDWARD E. PRINCE, DOMINION COMMISSIONER AND
GENERAL INSPECTOR OF FISHERIES FOR THE
DOMINION OF CANADA.

(WITH THREE PLATES.)

In view of the economic importance of the herring family (the Clupeidæ), of which some species, such as the sea-herring, the shad, sardine, &c., have a high commercial value, it is a matter of surprise that accurate information regarding the habits and life history of most clupeoids is not available, or, at any rate, not generally accessible. For a long period the most absurd opinions prevailed respecting the migrations and spawning of so familiar a member of the family Clupeidæ as the common herring of the Atlantic ocean and the North Sea. Pennant's version of the theory, universally accepted a century and a half ago, is so often referred to in works on fishing industries, that I quote somewhat fully from his 'British Zoology,' vol. III., London, 1769. 'The herring,' he says, 'are met with in vast shoals on the coast of America as low as Carolina, and in Chesapeake bay there is an annual inundation of those fish, which cover the shores in such quantities as to become a nuisance. We find them again in the seas of Kamtchatka, and possibly they reach Japan,* for Koempfer mentions, in his account of the fish of that country, some that are congenerous. The great winter rendezvous of the herring is within the Arctic circle; there they continue for many months, in order to recruit themselves after the fatigue of spawning, the seas within that space swarming with insect food, in a degree far greater than in our warmer latitudes. This mighty army puts itself in motion in spring. we distinguish this body by that name, for the word "herring" is derived from the German "Heer," an army, to express their numbers. They begin to appear off the Shetland isles in April and May; these are only forerunners of the grand shoal which comes in June, and their appearance is marked by certain signs, by the numbers of birds, such as gannets, and others which follow to prey upon them; but when the main body approaches, its breadth and depth are such as to alter the appearance of the ocean. It is divided into two distinct columns 5 or 6 miles in length and 3 or 4 in breadth, and they drive the water before them with a kind of rippling, sometimes they sink for the space of 10 or 15 minutes, then rise again to the surface, and in bright weather reflect a variety of splendid colours, like a field of the most precious gems. . . . The first check this army meets it divides into two parts, one wing takes to the east, the other to the western shores of Great Britain, and fill every bay and creek with their numbers; others pass on towards Yarmouth, the great and ancient mart of herrings; they then pass through the British channel, and after that in a manner disappear. Those which take to the west, after offering themselves to the Hebrides, where the great stationary fishery is, proceed towards the north of Ireland, where they meet with a second inter-

* There is an important herring fishery in Japan to which I refer on a subsequent page.

ruption, and are obliged to make a second division; the one takes to the western side, and is scarcely perceived, being soon lost in the immensity of the Atlantic; but the other, which passes into the Irish sea, rejoices and feeds the inhabitants of most of the coasts that border on it. These brigades, as we may call them, which are thus separated from the greater columns, are often capricious in their motions, and do not show an invariable attachment to their haunts. . . . Though we have no particular authority for it, yet as very few young herrings are found in our seas during winter, it seems almost certain that they must return to their parental haunts, beneath the ice, to repair the vast destruction of their race during the summer by men, fowl and fish. Some of the old herring continue on our coasts the whole year; the Scarborough fishermen never put down their nets but they catch a few; but the numbers that remain are not worth mention in comparison to the numbers that return.'

Dr. John Johnston, in his famous *Historia Naturalis, De Piscibus et Cetus*, lib. V., Amsterdam, 1657, ventured to give a more detailed account of the herring migrations off the British islands. His quaint Latin narrative may be thus rendered: 'Wonderful indeed are the particulars of the migrations of the herring. In former days they lingered in Norwegian waters as their home; but in our time they swim all round Britain in immense armies. About midsummer they seek the Scottish shores from the deeps, and they descend upon the English coast, being taken from Scarborough Castle to the Thames from the middle of August. Afterwards some are carried by currents into the English channel and there offer themselves to the fishermen until Christmas. Thence they swim along both sides of Ireland to the north ocean, as if circumnavigating Britain, and then disappear until June. Later they return as soon as winter is over.'

It is due to Mr. John Cleghorn, of Wick, Scotland, that this marvellous story of the herring's movements from northern waters was first discredited. In a paper read before the British Association, at Liverpool, in 1854, he set forth the following considerations unfavourable to the generally accepted theory:—

(1) Herring remain within narrow limits as local races, distinct in size, quality, time of spawning, &c., and do not migrate over immense distances. (2) Increased netting has not increased the total yield as compared with the previous twenty-five years, owing to the depletion of the local schools. (3) Catches at particular stations may be vastly increased; but the fish in restricted areas may be exterminated.* (4) On extensive open shores herring survive in numbers longer than in circumscribed areas, especially near large cities, where the fish always decline and disappear first.

There is now a general consensus of scientific opinion that all the important species of food fishes are local in their distribution and migration, the herring being no exception to this general rule. Not only are local varieties of herring distinguishable, but even on the same parts of a coast the herring schools have been separated into littoral and deep-water varieties. Thus, in Norway, a shore herring has been recognized, while a deep-water herring, which comes inshore at the spawning time only, has been similarly distinguished. Such littoral and deep-water schools of other marine creatures may exist, so that the fishermen of Nova Scotia who speak of the deep-water lobsters are no doubt right in regarding them as distinct from those habitually haunting the areas close inshore. The herring, on most shores where attention has been directed to the matter, appear to move off into open or deep water after spawning, the schools which continue to linger near shore being small and unimportant. It is, indeed, this existence of local schools of all kinds of fishes, which ensures most effectively the continuance of the fisheries as a commercial resource. Were the herring of a sea, like the North sea or German ocean, to move annually in one great body, it might be possible by effective and vastly increased methods of destruction to imperil them with

*Amongst the statements of the Royal Commission on Scottish Herring Fisheries, 1879, this occurs: 'Either from the operations of man, or from some other cause, the herrings have been deterred from entering firths and sea-locks in the same numbers as formerly.'

SESSIONAL PAPER No. 22a

total extermination, but the onslaught made by man and by the natural enemies of the funny tribes cannot destroy utterly all these local schools, to which reference has been made, and the recuperation of even depleted areas from more populous areas is no doubt Nature's method of constant restoration.

On the shores of Britain, excepting perhaps the southern shore, there are two spawning seasons annually for herring. Professor Huxley, in 1862, distinguished the spring and autumn spawning schools. Their periods of spawning are January to March, and from the end of August to the end of September,* the earlier spawning schools vastly surpassing in numbers the later or autumn schools. The migration in-shore of the fish about to spawn reveals a remarkable serial succession as the fishermen move from their northern fishing grounds to the south with the progress of the season. The following table shows the dates, from May to December, at which the herring fleet operates on the coasts of the British isles:—

* This is clearly shown by the Scottish Fishery Board's Reports, as the 'Crown' brand for 'full' herrings is affixed during the two periods, viz., February and March and again in July and August.

6-7 EDWARD VII., A. 1907

In Canada there is a spring and fall migration of the herring, the earliest fish coming inshore as early as the month of March, or as soon as the ice disappears; but they are of small size, poor in condition, and used chiefly for bait in cod fishing. Later the fine fat bank herring move easterly from the west, and are taken some distance off shore, but in June and July the best herring for market purposes are generally taken. The spring spawners deposit their ova in shallow water in May, while the fall spawners come in in the months of September and October, and besides containing large roes or milts are of much larger size than the earlier runs. On the Labrador coast very large herrings are taken, the season commencing as a rule at the end of August, and being carried on in September and October. They are regarded as of very superior quality.

Owing to its vast commercial importance, it is not surprising that the herring has formed the subject of many reports and disquisitions. In 1864 the well-known work treating solely of the herring, by Mr. J. M. Mitchell, appeared. It was entitled 'The Herring, its Natural History and National Importance,' and in that work the Arctic migration theory was finally demolished. Accurate information upon the eggs of the herring and the spawning grounds was long wanting, but the eminent Professor G. J. Allman, on March 1, 1864, assisted by Dr. Bain, obtained off the Isle of May, on the coast of Fife, a quantity of herring spawn which was found attached to the rocky bottom at $14\frac{1}{2}$ to 20 fathoms depth. In February and March, spawning, or 'full' herring were known to occur there in quantity, and dredges were used and divers were sent down in order to secure the eggs deposited under natural and normal conditions. The nature of the eggs and their mode of attachment to the sea bottom was thus finally settled. In 1874, some interesting experiments were carried out at Kiel, in Germany, the herrings' eggs being artificially fertilized and incubated under the supervision of a special commission in May, and the young fry, after hatching, were kept until the yolk bag was exhausted in the sixth day. Other eggs were obtained, later in the same year, and carefully studied, viz., in October. The United States Fish Commission, four years later, hatched herring at Gloucester, Mass., and in 1883, Professor Ewart, Mr. J. T. Cunningham, and Dr. J. Gibson, carried out further hatching experiments in Edinburgh. An exceedingly able naturalist, the late Mr. Geo. Sim, of Aberdeen, treated fully the spawning and feeding habits of the herring, in certain original papers, notably one included in the Edinburgh Fisheries Exhibition Essays, 1882, while authorities such as Meyer, Heineke, Dr. F. Day, Duncan Matthews, George Brook, Prof. J. A. Ryder, Mr. E. W. L. Holt, and Drs. McIntosh and Masterman, have added greatly to our knowledge of the herring and allied species. More recently Ehrenbaum, P. P. C. Hoeck and others have published fine memoirs upon the subject, and references to these will be found on subsequent pages.

A valuable series of young Clupeoids was recently obtained by me in certain rivers and harbours in Nova Scotia and New Brunswick, and formed the subject of my study at the Canadian Marine Biological Station, and I am able to add to our knowledge of these fishes, especially the anadromous alewife, kyack or gaspereau (*Pomolobus pseudoharengus*, Wilson, and *P. aestivalis*, Mitchell), and to present in succinct form my researches, along with the results of various other scientific workers, I also include some notes made on the gaspereau spawning grounds on the Washade-moak lake, St. John river, New Brunswick.

My first acquaintance with Clupeoid ova dates from April, 1885, when a batch of herring eggs, handed to me by Professor McIntosh, of the University of St. Andrews, occupied my attention, and I made drawings of the ova and of the young fry when they hatched out. These eggs, picked off the cart of a fish 'cadger' or pedlar in St. Andrews, Scotland, were placed in the tanks of the Marine (now the Gatty) Laboratory, where they were duly incubated. The eggs had been squeezed out of the ripe herring by the pressure of the fish heaped up in the cart, and in the mixed mass the sperms from the ripe males mingled with and fertilized the ova. The sun's rays had dried the outside of the spongy masses, and the inner eggs survived as clear glassy globes about $\frac{1}{20}$ of an inch in diameter, thus convincingly

SESSIONAL PAPER No. 22a

demonstrating the hardy nature of the herring's eggs, a feature to which Professor McIntosh drew attention as a fact of vast importance from a fishery point of view. Indeed sufficient attention has not been directed to this fact, emphasized by Professor McIntosh, for there can be no doubt that the continued plenitude of the herring in waters, where immense fisheries have been carried on for centuries, is largely due to this hardness to which that eminent authority drew attention.

Man is but one of a multitude of destructive agencies making war upon the herring; whales, porpoises, seals, &c., storms, high tides and other physical causes, all add to the destruction. In Gloucester, Kent, and Northumberland counties, New Brunswick, herring spawn is heaped up knee-deep for many miles, after severe gales, in some seasons, and is then carried on to the fields for manure. 'It is impossible,' wrote Dr. Pierre Fortin, a Canadian inspector, more than forty years ago, 'to form a correct idea without seeing it, of the immense abundance of ova of the herring deposited on the Canadian coast, where the herring spawns. I have seen the shore at Pleasant bay, Magdalen islands, covered 2 or 3 feet deep with them for several miles, and oftentimes on returning to my vessel I have seen the sea white with milt for several acres round, though when I passed the same spot two hours before the water was of the usual colour.' On the Pacific coast of Canada the herring schools are no less abundant, indeed they are even more plenteous. From the Straits of Georgia to Queen Charlotte islands, and still further north along the Alaska shores belonging to the United States, the herring are incredibly abundant. Near Nanaimo, Vancouver island, the harbours and bays appear to be filled with solid masses of moving herring, and I myself in February, 1902, passed through a floating mass of dead herring extending for over two miles as I travelled on the mail steamer from Vancouver to Nanaimo. Whether these fish, which floated in a mass two or three feet deep, die from suffocation, being crowded in narrow inlets and bays, or from submarine explosions or poisonous volcanic influences, has not been determined. In 1883, Burrard Inlet, near Vancouver City, was filled with herring, and by seining on a very small scale over 1,700 barrels of herring were secured, with little labour, which were salted and shipped to Australia, where there was an eager demand for them. Herring oil extracted by cooking and pressure was valued years ago at 40 cents per gallon, and the refuse remaining was converted into fertilizer material. The Alaska Oil and Guano Company, the principal United States producers of herring products on the Pacific coast, sent in 1900 into the markets no less than 172,000 gallons of herring oil, extracted from about 60,000 barrels of herring, besides 1,200 tons of guano (valued at \$26,400), and 192 barrels of salted herring, valued at \$960, the oil alone bringing \$34,000. Other United States companies put up in the same season 3,000 barrels of salt herring, valued at \$14,000. The British parts of the Pacific coast are regarded as even more productive, and a great herring industry lies open for development. Certain bays along the Tsimpsian peninsula and at the northern end of the Queen Charlotte group, are crowded with fine herring in the spring.

On the western Pacific shores the herring are plentiful, and there is a very important fishery on the coast of Japan, where they come in in immense schools from the outside sea to spawn at the end of spring and in the early summer. The west shores of Hokkaido are famous herring resorts; but the schools are generally distributed where there is a cold under-current in spring.

It may be added that over 40,000 barrels of herring are used annually on the Atlantic coast in the lobster fishery of Canada, the value at \$1 a barrel thus amounting to \$40,000.

Other Clupeoids, such as sprats, pilchards, shad, gaspereau, &c., appear in similar stupendous quantities when moving to their spawning grounds, or schooling for other purposes. 'I have seen,' said Dr. Matthias Dunn, the Cornwall fishery authority, 'a single porpoise drive tens of thousands of pilchards at will, as easily as a dog could drive a flock of sheep.'

The Basque sardine fishermen take advantage of this habit of the porpoise (mar-souin), and surround sardines and porpoises with their seine, permitting the porpoises

6-7 EDWARD VII., A. 1907

later to escape, as M. J. Kunstler describes (*La Question Sardinière*, Bordeaux, 1904): 'Pour pêcher, on recherche une bande de marsouins quel 'on suit jusqu'à ce qu'elle ait réussi à former un banc compact de sardines. Puis la senne est mise à l'eau, en même temps que les rameurs impriment au bateau un assez rapide mouvement en cercle. On entoure ainsi les marsouins aussi bien que les sardines.'

The eggs of the herring family have as a rule the form of small translucent glassy spheres, possessing a strong hard shell like thin transparent horn. They may cling together in spongy masses as bunches, or form a film of transparent pellets, on stones, algae, shells, &c., and leaving interspaces through which the water can flow freely, and thus aerate the eggs, or they may have the buoyancy of pelagic eggs and float freely at the surface (like the pilchard's and sprat's eggs), or lie loosely on the bottom, as is the case with the ova of the shad. Eggs which cling together like those of the herring are coated with a tenacious mucus, and as they fall through the water they are fertilized by the milt of the male, which beclouds the water, and on reaching the bottom the external cement hardens so that they bunch together, or cling firmly to foreign objects. Mr. Joel Ingersoll stated to the New Brunswick Herring Fishery Commission, in 1836, 'At Seal cove and Whale cove, at Seal cove particularly, (on Grand Manan island) I have seen the net warp become as thick as my arm with the herring spawn, and the nets and anchors covered also,' while Mr. Samuel Chaney, of Grand Manan, said, 'I have seen it on anchors and warps and on the nets in great quantities.'

In British Columbia the Indians lay twigs and tree branches on the shallow herring spawning grounds, and after they are coated with the eggs, they take the twigs out and either eat them, raw or dried, by nibbling the branches between their teeth, devouring the eggs as a great dainty.

All the Clupeidæ have not dense heavy eggs, as already pointed out. There are, indeed, three types of ova:—

(1) The demersal or non-buoyant eggs which cling together and are attached to adjacent objects at the bottom, of which the sea-herring is an example. The alewife, kyack, or gaspereau, produces non-floating eggs, not so dense as the herring's but much heavier than those of the shad and less than one-half the diameter of the shad's eggs. They adhere to each other and to stakes, stones, &c., under water, and measure about $\frac{1}{20}$ of an inch in diameter (1.27 mm.). They are fairly hardy, and survive conditions that would be fatal to the eggs of the shad.

(2) The semi-buoyant eggs like the delicate spherical ova of the shad, $\frac{1}{8}$ or $\frac{1}{7}$ of an inch in diameter (3.29 mm.), and very pale amber in colour (Plate IX., fig. 22). The ball of yolk (*a*), which only fills about one-sixth of the chamber of the egg capsule, is very granular but contains no large oil-globule. The eggs are tenacious when laid, but harden under water, and do not cling to adjacent objects. They simply roll loosely on the rock, sand, or shelving flats in the non-tidal parts of rivers, where the shad spawns. The Twaite Shad (*Clupea finta* Cuv.) occurs in Britain and in European waters, but has not been recognized on this continent, though it is possible that it inhabits our coasts; indeed as Mr. Thomas F. Knight, in 'The River Fisheries of Nova Scotia' (Halifax, N.S., 1867), says, 'It is said by the fishermen of the Bay of Fundy that there are two species or varieties This opinion is not confirmed by any description of the shad by naturalists; they know of but one species.' It produces an egg (Plate IX., fig. 21) quite different in size and other features from the common shad or Allis shad, as it is called in England. It is a much larger ovum than that of *Clupea alosa*, being $\frac{17}{100}$ of an inch in diameter (4.25 mm.). Dr. Ernst Ehrenbaum has studied very carefully the egg of this species at the Biological Station, Heligoland, and he refers to a peculiar reticulated character possessed by the shell or egg capsule: thread-like thickenings forming a rectangular network, like a fine basket-work pattern, so that the shell externally appears as if divided into minute squares, some being incomplete (Plate IX., fig. 25). Ehrenbaum describes the egg in detail (*Beiträge zur Naturgesch. einig. Elbfische*, Wissensch. Meeresuntersuch, Bd. 1), as well as the larval, post-larval and adult life-history, and on a later page I refer to his elaborate account.

SESSIONAL PAPER No. 22a

(3) Finally, there is the typical pelagic or floating egg of some Clupeoids. All pelagic eggs are marked by translucency, buoyancy and extreme delicacy of structure; but the eggs of the sprat (*Clupea sprattus*, L.) and the pilchard or sardine (*Clupea pilchardus*, Walb.) are of unusual delicacy and buoyancy. The ova named are practically spherical; but one clupeoid ovum of the pelagic type is quite ellipsoidal, viz., that of the anchovy (*Engraulis encrasicolus*, L.). The eggs of the sprat were first discovered by Hensen in the Baltic, and were studied in detail by Professor Pouchet in Brittany, and Mr. J. T. Cunningham, who obtained them in the Firth of Forth. They are about $\frac{1}{25}$ of an inch (1.016 mm.) in diameter; some, not perfectly spherical, measuring $\frac{1}{20} \times \frac{1}{25}$ of an inch ($1.01 \times .99$ mm.), and the capsule is extremely tenuous, while the clear colourless yolk, which almost completely fills up the capsule, shows delicate interlacing lines or reticulations as though the yolk were incompletely divided into spheres. The pilchard's egg is similar, about $\frac{1}{3}$ inch (3.8 mm.) in diameter, of extreme translucency, but the yolk occupies only a portion of the chamber of the capsule. The yolk substance is divided into spheres, and in its midst is seated a large oil-globule.

The spawning season, breeding habits, number of eggs produced, and the time occupied in incubation, show great variation in the Clupeidae. We have seen that the sea-herring spawns at two different seasons in the year, and that special areas are selected year after year, where the sea-bottom presents suitable features for the deposition of the eggs, a hard bottom being a necessity, and usually of a rough shingly or rocky nature. They spawn in 10 to 20 fathoms of water, the eggs, deposited by the ripe female, being fertilized before reaching the bottom, where they adhere to zoophytes, stones, &c. The number produced by one herring is found to range from 10,000 to 30,000 or 40,000, or even 60,000, and at 53° F. they hatch out in six to eight days, while at 33° or 34° F. they take thirty to forty days. Some recent observations by Dr. Jenkins embody many interesting results both as to the comparative productiveness of different varieties of the sea-herring, and the proportions of male and female found in certain captures of the fish carefully examined. He ascertained that eight autumn herrings had in different cases from 13,000 to 65,000 eggs, while five spring herrings had from 25,264 to 45,543, the mean number for the lot being 30,000. Dr. Fulton found that sixteen spring herrings had a mean of 31,768 eggs, the numbers in different fishes varying between 21,500 to 47,466. Jenkins shows that the number varies with the size and age of the fish, the smaller and younger having fewer. With regard to the proportion of the sexes authors are not quite agreed. Fulton found that among 3,457 examined 1,724 were males and 1,733 females, while Heincke found 822 females and 606 males among 1,488, and Jenkins 148 females and 155 males among 303.

On a lake near Kiel where the water is brackish, and communication with the sea has been cut off, ripe herrings were found to be considerably smaller than those got in the Baltic, and to have a lower fecundity. Five, for example, contained only from 4,245 to 7,950 eggs, the average being 5,615, and the earbones showed that the herrings were three years old, while their average length was $5\frac{3}{8}$ inches, and their average weight 16.1 grammes, or a little over $\frac{1}{2}$ ounce. The average length of the autumn Baltic herring of similar age was 7 inches, its weight 39.5 grammes ($1\frac{1}{2}$ ounces), and the number of its eggs 15,709.

The sprat and pilchard, having pelagic or floating eggs, scatter them freely in the sea, and although certain spawning areas seem to be selected by these fish each year, the eggs they produce must be widely scattered in the water. The former spawns very early in the year, viz., January to May,* while the pilchard is later, probably May and June, or even subsequently, while in more southerly waters the period is in winter and early spring. Mr. J. T. Cunningham hatched out pilchard eggs in three days and the sprat take about the same short time, indeed the Clupeoids appear generally to develop rapidly, and whereas the salmon, trout and similar fishes, with large, heavy eggs, take from 90 to 160 days, normally rather less than the latter period, and even cod, had-

* Professor McIntosh obtained specimens abundantly early in May at St. Andrews, Scotland.

dock, flounder, and species which deposit small floating eggs in the sea, take from 15 to 30 or 40 days unless the temperature be high, when 9 to 10 days may be the time occupied in incubation, all the Clupeoid eggs hitherto studied appear to pass through the stages of embryonic development far more rapidly than the fishes above referred to. With the shad, and gaspereau or alewife, the conditions of spawning are wholly different, for both these fish leave the sea, which is their habitat, to spend a few weeks in rivers up which they ascend to spawn in fresh water at no great distance above tide limits. When the water temperature is 56° to 60° F., in late May or in June, the shad pass into their customary rivers, the males preceding the females. They ascend with considerable rapidity, and within 12 to 14 days are found crowded on the shallow sandy or pebbly areas, generally some tributaries of a large river, and deposit their minute semi-buoyant spawn. The number each fish produces is about 30,000, though large examples have been known to yield 60,000 eggs, or even double that quantity. They hatch out in 7 to 10 days, when the clear shallows are found to be alive with the wriggling jelly-like little larvæ. The alewife or gaspereau is usually somewhat earlier, and enters the rivers about the last of April or the early part of May, when the waters are in flood. They often mingle with the shad which follow them, so that the nets set for shad capture gaspereaux in great quantities. They are able to surmount falls and dams, if not more than 2 to 2½ feet high, throwing themselves spasmodically forward and flapping the tail vigorously. The strongly serrated abdomen is said to aid in surmounting difficulties, but this is probably not so. Having gained the calm upper waters some distance above the reach of the tide, the spawning immediately commences. On moonlight nights the shallow waters present a much-disturbed appearance owing to the energetic movements of the mating fish, whose tails and fins project above the water as they rush hither and thither. In a few nights the process is over, and the fish within three weeks of their ascent are found descending in a very thin emaciated condition. Some remain until July, but as the eggs take a very short time in hatching out, the young fry are found abundantly before the end of June, as transparent worm-like creatures less than one-fifth of an inch long (4.84 mm.). The ova are smaller than those of the shad, viz., about 1/20 of an inch (1.86 mm.), and they cling together by means of their adhesive capsules in masses, becoming attached to stakes, submerged roots, stones, &c. The yolk fills up the capsule, as in the sea herring and sprat, not leaving a large perivitelline space, as is the case with the eggs of the pilchard and shad.

It is an interesting circumstance that young larvæ of the Clupeidæ are not only distinguished by their exceptionally delicate structure and appearance, but by the absence or very sparse presence of colour spots or pigment. There is usually a linear series of black stars or minute spots along the straight elongated digestive canal and intestine (Plate VIII., figs. 2, 3, and Plate IX., figs. 14 to 16); but not scattered, as in so many young larval fishes, over the body, cranium, and embryonic fin-membranes, or even over the yolk-sac hanging below the body of the fish. But the most distinctive feature is the position of the anal opening or termination of the intestine—this aperture being in most fishes at a point distant about one-third of the body's length from the snout, more or less, some species having the anus midway along the ventral margin of the body; but in the case of herring, sprat, shad, pilchard and clupeoids generally, it is at a point about four-fifths distance along the under side of the body, and very near, therefore, the basal portion of the tail. The position is slightly nearer or further from the tail in different species, but in all it is so far posterior in position that a clupeoid larva can be immediately determined by that feature. Even in a non-clupeoid like the sand-eel (*Ammodytes*), with the anal opening apparently far back (*vide* McIntosh and Prince, *Life Histories of Food Fishes*, Roy. Soc., Edin., Vol. XXXV., 1890, Pl. XIII., figs. 6 and 7), it is nevertheless about semi-distant along the ventral line; and in the smelt its position is fully three-quarters of the body-length from the snout. Further, the notochord is in a number of cases quite diagnostic in appearance. This cartilaginous rod or primitive backbone is divided up into a series of seg-

SESSIONAL PAPER No. 22a

ments, like a horizontal column of draughts or disks in the herring, sprat and pilchard (Plate VIII., figs. 1, 2, 6, 7, 8 and 9), but in the shad and gaspereau (Plate VIII., figs. 10 and 11), its structure is that of an irregular network, or complex meshwork, as in most cases not belonging to the herring family. This peculiar regular arrangement of the notochordal cells is a striking feature and facilitates the recognition of many newly-hatched Clupeoids, when mingled with other fish-larvæ; but the extremely posterior position of the anus, usually with a little bay or indentation in the ventral marginal fin (Plate VIII., fig. 11, and Plate IX., figs. 17, 18, 19), and the regular series of stellate black spots, either in a single or double line, along the upper or the lower contour of the digestive canal, are, as far as at present known, characteristic of all the herring family. Other stellate spots of a black colour, few in number, may occur on the head around the cylindrical kidney tubes or on the caudal fin-expansion at the posterior termination of the notochord. These fishes, therefore, present a great contrast to the young stages of the majority of species of other families, in which elaborate arrangements of colour, yellow, reddish brown, orange, ochre, black, purple, blueish and greenish spots may occur, massed in many species as bars or patches along the body. The surface of the protruding yolk-sac may also be brilliantly diversified as well as the wide marginal fin-membrane. As the yolk and fin-membranes and the body generally in the herring, shad and clupeoids are usually colourless, their delicacy of structure and glassy transparency are thereby increased. Some, as the sprat, show absolutely no pigment at all when they emerge from the ovum (Plate VIII., fig. 8). The yolk, moreover, in most species, is comparatively small compared with the length of the elongated eel-like body, and does not form the exaggerated protruberance seen in so many fishes, *e.g.*, salmon, trout, cod, &c. On comparing the newly-hatched larvæ of various species of clupeoids a considerable variation in their length is observable, the length of the sprat (*Clupea sprattus*) from the tip of the snout to tip of the tail is 3.6 mm. ($\frac{1}{4}$ inch), the pilchard (*C. pilchardus*), 3.8 mm. ($\frac{1}{2}$ inch); the alewife or gaspereau (*Pomolobus pseudoharengus*, Wilson), 5 mm. ($\frac{1}{2}$ inch); the sea-herring (*C. harengus*, L.), 5 to 7 mm. ($\frac{3}{4}$ inch); the Twaite shad (*Clupea* or *Alosa finta*, Cuv.), 4.25 mm. (less than $\frac{1}{2}$ inch, *i.e.*, $\frac{1}{24}$), and the common shad (*Alosa sapidissima*, Wilson), 9.29 mm. ($\frac{3}{4}$ inch). Thus, the pilchard would appear to be rather more than one-third of the length of the shad, the gaspereau rather more than half, the Twaite shad less than half, and the sea-herring considerably more than half the size, while the sprat is about the same length as the pilchard on hatching. This variation is a most striking one, but it is no key to subsequent growth during the larval and post-larval stages of the species referred to.

By the sixth day after hatching, the Twaite shad (Plate IX., fig. 13), according to Ehrenbaum, doubles its length, being 8.7 mm., or rather more than $\frac{1}{2}$ inch: a length which the sea-herring does not attain until about the tenth day, though the herring, as above noted, is a much larger larva when it issues from the egg. The shad, like the sea-herring, almost doubles its length in ten days, measuring 15.73 mm. ($\frac{15}{16}$ inch), while the pilchard is stated to be 24 mm. ($2\frac{1}{25}$ inch) at that age, a measurement which no doubt needs confirmation by further observation. By the twentieth day the herring (Plate VIII., fig. 2) exceeds 10 mm. in length ($\frac{2}{5}$ inch), the Twaite shad (Plate IX., 14) is $\frac{28}{50}$ of an inch, and the common shad (Plate IX., fig. 19) $\frac{36}{50}$ inch, or about 19 mm. When double the age just mentioned, *i.e.*, on the fortieth day, the herring is a little over half an inch long (2.69 mm.), the gaspereau is about the same length, 14 to 15 mm. (Plate VIII., fig. 10), but the shad still exhibits remarkable growth, being on the thirty-fifth day 56.95 mm. long, *i.e.*, 2 to $2\frac{1}{4}$ inches long (Plate IX., fig. 20), while the Twaite shad, on Ehrenbaum's authority, is barely $\frac{4}{5}$ inch (20 mm.) (Plate IX., fig. 15), and reaching on the forty-third day a length of nearly an inch, 24 mm. (Plate IX., fig. 16). At the age of two months, or, to be more accurate, on the seventyeth day, the herring exceed $\frac{72}{100}$ inch (18.9 mm.), whereas the shad is now 3 or 4 inches long (75 to 100 mm.), while by the fourth month the shad is stated to have doubled its length, being 5 to 7 inches long (125 to 175 mm.), as compared with the

6-7 EDWARD VII., A. 1907

sea-herring of the same age, which is 29 mm., or about $1\frac{1}{4}$ inches long. The gaspereau, from an experiment reported to have been carried out in Maine, U.S., by Messrs. Treat & Son, reaches a length only half that of the shad at the age when the shad is 3 to 5 in. long (4 months old). Of course, such fishes, when confined in rearing ponds, are probably dwarfed in their growth, and may not afford a certain clue to the determination of the age of specimens captured in their native waters. Shad have, for instance, been taken 3 to 4 inches in length in February, while specimens of the same length have been secured in great numbers in September; and in the Potomac river examples 3 inches long are abundant in November, while about the first of that month shad 5 to 7 inches long are plentiful in the Maine rivers. According to my observations, the first-named specimens (3 to 4 inches long) must have been hatched out in November or December, a supposition which raises a difficulty, as shad enter rivers, in December and January, on the Atlantic coast, only as far south as Georgia and Florida, while the small shad of the size named, captured in September, as in the Potomac river, must have been hatched in June, though the main ascent is as early as April in that river. Shad 9 to $13\frac{1}{2}$ inches long are frequently taken in Canadian waters in October, and as these fish cannot possibly be only four months old, and must be the young of the year preceding, especially as shad 3 or 4 inches long are also captured about the end of October, and schools of fish 4 to 5 inches long are observed in December. We know that shad are apt to migrate along long distances of sea shore, as on the Pacific coast, where they have spread far from the rivers where they were originally planted, so that they are not so true to their native rivers as the salmon, and this may explain the very discrepant nature of the facts alluded to. In Florida shad ascend rivers in December, as already stated, while in the Savannah and Edisto rivers of Georgia they are found in January, in the Potomac in April, Delaware river in May, and in the Canadian rivers from the middle of May (in St. John river, N.B.) to the end of June, especially in the more northerly rivers, as the Miramichi. A month later, in July or August, the spawned fish descend to the sea again in very poor emaciated condition, and the young fry begin to descend about the same time, but go down more slowly.

It is, of course, a matter of much difficulty to trace the later history of the various species now under review, but some principal facts may be determined. Thus the small sea-herring 62 mm. ($2\frac{1}{2}$ inches) long taken in September cannot possibly be the fry of the July spawning schools, as such fry could not be more than about 1 inch long according to the foregoing account, nor is it possible for the fry hatched in April, May or June to be more than $1\frac{1}{2}$ to $1\frac{3}{4}$ inches long, making all allowance for great variations in growth. The herring $1\frac{3}{4}$ to 2 inches long found in January off the east coast of Scotland must be five months old, if they are, as Mr. Geo. Sim held, the fry of the August preceding, while similar young fish in June and July must be March fry. In its second year a sea-herring is 60 to 80 mm. long ($2\frac{1}{2}$ to $2\frac{3}{4}$ inches), though Hjort states his views that a length of $2\frac{1}{2}$ inches (50 to 60 mm.) may be reached in six months. The specimens of herring $3\frac{1}{4}$ to $4\frac{1}{2}$ inches frequenting St. John harbour in August (Plate I., fig. 5) are not likely to be the fry of the preceding spring and only four or five months old, nor of the previous fall (August or September), but of the spring or fall prior to that. A year later, when barely 3 years old, the fish are $4\frac{1}{2}$ to 6 inches long (114 to 150 mm.), though Hjort again holds that in $2\frac{1}{2}$ years a herring reaches 160 to 165 mm. ($6\frac{1}{4}$ to 7 inches) in length.* Herring 8 to 11 inches long cannot be less than 3 years old, and may be in their fourth year. Dr. Meyer decided after his studies upon the herring (30 years ago) that herring $6\frac{1}{2}$ to 7 inches long are only 2 years old, and that within one year after hatching they are 5 to $5\frac{1}{2}$ inches long, an opinion not confirmed by more recent researches. Sars, Nilsson, Sundevall and others do not support Meyer's views. Dr. Jenkins in his recent studies at Kiel states that the Baltic herring show the following growth: 1st year, $4\frac{1}{2}$ to $4\frac{3}{4}$ inches; 2nd year, $6\frac{1}{2}$ to $6\frac{1}{2}$ inches; 3rd year, $7\frac{1}{2}$ to $7\frac{3}{4}$ inches; 4th year, $8\frac{1}{2}$ to $8\frac{3}{4}$ inches; 5th year, $9\frac{1}{4}$ to $9\frac{3}{4}$

* The common opinion that the 'matie full' herring, 9 to $9\frac{1}{2}$ inches long, in Scotland is only 2 years old can hardly be correct.

SESSIONAL PAPER No. 22a

inches. The sprat, which on hatching out is only about half the size of the herring and one-third the size of the shad, is believed to reach a length of 3 inches in one year, in its second year it is said to be $4\frac{3}{4}$ inches and in its third year $5\frac{1}{2}$ inches long, while the pilchard, which resembles the sprat in so many points in its embryonic and larval life-history, is believed to grow much faster during its post-larval life. Professor A. F. Marion declared that the rate of growth is half an inch (1cm.) per month, so that the translucent larva $\frac{1}{2}$ inch long on hatching becomes a post-larval fish 1 to $1\frac{3}{4}$ inches long (20 to 40 mm.) when between one and two months old—a view very difficult to favour. The famous French authority holds that when 140 to 150 mm. they are ready to spawn and are not more than one year old. As compared with other Clupeoids a growth of a centimetre a month is of course unusually rapid. Mr. J. T. Cunningham obtained specimens which were only 8.5 mm. long ($\frac{1}{2}$ inch), and according to Marion's calculations these were less than one month old, while his other specimens (Mar. Biol. Assoc. Journal, Vol. II., p. 161, Pl. X., fig. 3) would be five months old, and the same size as the sea-herring at that age. Pilchards 3 to 4 inches long are abundant in October Mr. M. Dunn has recorded, and, at Marion's rate of growth, would be the fry of March or April ova; but on the Cornish coast, June, or even earlier, appears to be the spawning period, and it is impossible until more extended work has been done to accurately decide the rate of growth. It may be added that the southern or Mediterranean sardine is a smaller form (6 to $7\frac{1}{2}$ inches) than the northern sardine which ranges from 9 to 10 inches when adult, a size which corresponds with the Canadian pilchard (*Clupanodon ceruleus* Girard), of which mature specimens studied by me ranged from 209 to 237 mm. ($8\frac{1}{2}$ to $9\frac{1}{2}$ inches).

The rate of growth is of first importance, as it is a guide to the age at which the various species of the herring family reproduce. The matter is one upon which authorities differ greatly. The common sea-herring was supposed by Professor Huxley to reach maturity in its first year, as De Caux had ventured to surmise before.* Mitchell held that maturity was reached in eighteen months, while Meyer favoured the second year, when the fish he thought were 8 inches long. but at the present time the prevailing opinion is that in the third or fourth year these fish reach the spawning condition as Sundevall, Ljungmann, Jenkins and others hold. Such a form as the dwarfed Caspian herring is of course exceptional, and is found to be ripe when only $4\frac{1}{2}$ or $4\frac{3}{4}$ inches long, while land-locked herring such as the variety in the Windebyer Noor, near Kiel, spawns when $5\frac{3}{8}$ inches long, and in its third year after being hatched. The Baltic herring spawn when 7 inches long. The sprat, a species only one-third the size of the shad, and half the size of the average herring and gaspereau, spawns when $5\frac{1}{2}$ inches long (*i.e.*, in its third year), that species being 3 inches long in its first year and $4\frac{3}{8}$ in its second year.

The movements of the young clupeoids, larval and post-larval, are interesting, and while much variety of opinion has existed amongst authorities, there is now a consensus of view which may be summarized as follows: The young fry, when newly hatched and far more delicate and translucent than most other fishes in the sea or in rivers, lie on the bottom for some time. The shad, it is true, was stated by Mr. Seth Green, to seek the main current in midwater in the rivers where it is hatched. 'How different this (he said) from the young trouts that lie almost helpless for 45 days and then are fain to hide behind roots and stone! Whereas these minute, transparent, gelatinous things, push boldly for the deep swift current, where they are too insignificant to be attacked by the great fishes.' It may be pointed out that, when liberated from the Seth Green hatching boxes, anchored in a current, the fry were bound to take to the swift water, 'with their heads up stream,' such delicate organisms being carried by the current away from the shallows. My own examination of the spawning grounds and 'nurseries' on the St. John river convinced me that the pebbly shores

* Professor Huxley, in his famous address at Norwich Fishery Exhibition, April, 1881, on 'The Herring,' admitted he had overestimated the rate of growth, in view of the results of the Baltic Commission investigations.

are the normal resorts of the fry of shad and gaspereaux, the transparent young being invisible as they securely lie amongst the shingle, sheltered from the rushing stream of water overhead. Even the sea-herring, hatched out on spawning beds at some depth, do not mount at once to the surface, but lie at the bottom (this stage is figured on Plate VIII., fig. 1), until they reach a length of 10 mm. ($\frac{1}{3}$ inch). When slightly larger the yolk is absorbed and larvæ 10 to 24 mm. long ($\frac{1}{3}$ to $\frac{2}{3}$ inch), (Plate VIII., fig. 2), ascend to the midwater level, where they linger until an inch or more in length (24 to 28 mm.), when they are found floating in countless myriads in the surface waters. The transparent, worm-like, almost colourless clupeoid larva begins to acquire some pigment or spots of colour after the small sac of food-yolk, suspended under the body, is absorbed (Plate VIII., fig. 2). Indeed, in the herring the eye is bright and silvery on hatching out, and Mr. Holt states that the mouth is open (Ann. of Nat. Hist., 1889, p. 370), though this does not, from my own study of herring larvæ, appear to be always the case. When about 1 inch long the post-larval herring move inshore, lingering near river mouths until they are 2 inches long (Plate VIII., figs. 3, 4), when they resort to midwater, and in the autumn following are again found inshore, having attained a length of 80 to 100 mm., *i.e.*, 3 to 4 inches (Plate VIII., fig. 5). I have obtained them in harbours in August and September congregating with the gaspereaux and shad in large schools. The shad appears to be the most precocious of the clupeoids in its early development. The yolk is absorbed by the fourth or fifth day after hatching (Plate IX., fig. 18), though a remnant remains, near the liver, until the fifteenth day, but minute conical teeth are developed before the end of the first week of larval life. The young fish develop rapidly, and within three months, though still delicate transparent creatures 2 to 2½ inches long, they have all the fins well-developed, and the deep form of the adult is being assumed (Plate IX., fig. 20). Norris, in his 'American Fish-Culture,' Philadelphia, 1868, gives a figure of the shad at this stage (*see* Plate X., fig. 36), referring to it as three months old in the text, page 161; but a descriptive note, at the end, states that the fish represented, is two or three weeks old, a patent impossibility, and that it is copied from the first report of the Massachusetts Fish Commission. By November the young shad are 4 or 5 inches long and frequent estuaries and harbour mouths.* This stage is represented in Norris' book, figs. 2 and 3, opposite page 141, and as the figures are extremely interesting, I have copied them on my Plate X., figs. 37 and 38. The parent fish, it may be added, descend after spawning and are captured late in July or in August, in poor condition, hardly fit for food. Those that escape the estuary nets resort to sandy flats, to recuperate, which they do rapidly. At the head of the Bay of Fundy are extensive feeding grounds of the shad, where they improve and fatten so rapidly that the 'fall' shad are regarded as the choicest of all inshore fishes for table purposes.

The gaspereau, like the shad, undergoes rapid growth after hatching out in June, when it is 5 mm., or $\frac{1}{2}$ inch in length, for it trebles its length in about a month. I secured specimens in the Washademoak lake, River St. John, N.B., $\frac{2}{3}$ inch (15 mm.) long (Plate VIII., fig. 10), which were of extreme interest. As no published account of these larva has been given by me though I described them to Section IV., of the Royal Society of Canada, several years ago, I will briefly detail their main features. The extreme posterior position of the anus is marked, the otocysts are unusually large, a feature common in the herring family in the larval stages, the head is depressed and the colour spots are black, excepting a few yellow dots which appear around the pupil of the eye, and an orange patch occurs in the pronephric region, behind the pectoral fins. The large size of the translucent pre-anal fin is a notable feature. There are three rows of black spots at this stage, *viz.*, a dorsal row from the crown of the head to the upper lobe of the tail, a second chain along the middle lateral line, and a third series along the middle abdominal line. I kept specimens alive and ten days later, when

* The capture on several occasions of shad 4 inches to 4½ inches long in New York harbour indicates a much slower growth than that generally favoured.

SESSIONAL PAPER No. 22a

the fish must have been 30 to 40 days old, they measured 16.5 mm. ($1\frac{3}{20}$ inch) (Plate VIII., fig. 11), and the rudiments of the dorsal fin are now seen as delicate rays, while the front part of the lower jaw is studded with minute teeth. A maxillary flap hangs from the upper jaw, this maxillary flap being prominent also in the young shad (Plate IX., fig. 19). Further, the notochord, as in the shad, consists of a network of irregular cells, unlike the regular notochordal disks, characteristic of the herring, sprat, &c. At this stage the pre-anal lobe, of great length, still forms a prominent feature, and is probably diagnostic of the gaspereau, though it is prominent in such a form as *Ammodytes*, the sand-eel. The globe of the eye is now black with pigment and the swim-bladder is visible as a large silvery almond-shaped sac with pigment (black) in its dorsal wall. Pigment is more abundant over the whole of the fish at this stage, the head, cheeks and throat being spotted plentifully with black, amidst which a few yellow stands of colour pass. In this stage, as in the previous stage, the dorsal fin membrane is very narrow, and forms a thin, rather meagre membranous ridge along the back from the shoulder to the tail. The pre-anal fin is still of disproportionate length and breadth, indeed, its breadth almost equals that of the trunk, a very unusual feature in fish larvæ, although in the shad it is a fairly prominent structure (Plate IX., figs. 18, 19). The tail is more distinctly spatulate, the hind margin being no longer rounded, but markedly flattened. Between this stage 16.5 mm. ($1\frac{3}{20}$ inch), and the stages figured on Plate X., fig. 26, when a size of 30 mm. ($1\frac{1}{2}$ inches) is attained, no intervening stages have been secured. The blunt rounded head, the stout, somewhat shortened body, and the large size of the eye and the paired fins, are in contrast to the similar stages of the herring (Plate VIII., fig. 4), and the shad (Plate IX., fig. 20). When 35 mm. long ($1\frac{3}{8}$ inches) (Plate X., fig. 27), the external features are practically the same, the pigment forming two lunate patches at the base of the tail being more marked; but the general translucency of the body is preserved and the pigment consists of very minute black specks scattered all over the dorsum, especially on the head and on the tail, a few spots occurring on the premaxilla, maxilla and mandible. Two features are worthy of special attention at this stage, viz., the shortness of the maxilla, which does not extend as far as a line drawn perpendicularly through the centre of the eye, whereas in the shad the maxilla extends considerably behind such a line (*vide* Plate IX., fig. 24), and in the herring (Plate VIII., fig. 5) barely reaches such an imaginary line, while again the snout is very acuminate and not bluntly rounded as in the shad and Twaite shad (Plate IX., figs. 23, 24). The strong serrations of the middle abdominal scales or scutes, so characteristic of the adult gaspereau, are already well marked (Plate X., fig. 29). A much older stage was obtained in St. John harbour, New Brunswick, about the middle of August, when specimens from 3 inches (75 mm.) up to 5 and $6\frac{1}{2}$ inches (140 mm.) were secured (Plate X., figs. 28 and 29). The specimens could not possibly be the young of the same season, and though one in ten was of the small size first mentioned and a fifth of them of the largest size, all presented much the same features and were practically adult in general external appearance. The scales are comparatively large, and completely clothe the body, and they differ much in form and size from the scale of the sea-herring of the same size (Plate X., compare fig. 30, a gaspereau scale, with fig. 31, a sea-herring scale, both scales being from the dorsum near the base of the dorsal fin). Hardly less distinctive is the series of abdominal scutes or middle ventral line of keeled scales. These, in the gaspereau (Plate X., fig. 30) are much more strongly pointed and projecting than in the young herring (Plate X., fig. 31), while the strong anterior process (*a*) is absent, or represented by a mere indication of a process in the posterior bifid margin of the scale. The sides and opercular surfaces are brilliant silvery in appearance, while the dorsum is of a dark purplish blue, thickly spotted with black. The orange or ochre tint, noticed in the early larval fish, still remains as a suffused tinge though far paler than when the gaspereaux are 30 mm. long. The paired and unpaired fins are very deeply spotted with black, whereas in the herring the fins are clear and transparent, and bear no black

spots excepting the tail-fin and a portion of the dorsal fin. In many specimens the dark lunar patches at the base of the tail still appear, while the dusky patch on the shoulder, absent in the herring, is distinct and remains in the adult. The very distinctive features referred to, and there are many others, are of aid in at once separating young gaspereaux from young herring of the same size with which they congregate in estuaries and harbours, or from the young shad, which are natives of the same rivers, though they do not seem to be as a rule found associated in the same schools of clupeoid fry.

The subsequent history of the adults of the clupeoids, whose life-history from the ovum onward has here been sketched, furnishes one of the most important subjects for marine biological research in the future. Apparently all alike resort to deep water, only to return to the inshore areas as the spawning time approaches. Specimens may be occasionally captured in estuaries and inshore areas long after the usual spawning time; but their occasional character emphasizes the general rule. Like the salmon, they disappear, and their whereabouts cannot be determined. With the return of the spring or the fall spawning time the herring schools come in from their unknown haunts, just as the shad and gaspereau revisit their chosen rivers in April and May, or the pilchard and sprat congregate in their breeding areas in the open sea far out from land, the former in May, June, July and later, and the latter in the earlier summer months, though both these fish, like the smelt, come in from deep water for some unknown purpose, when they are captured in immense quantities in October, November and December; often indeed as early as the last week in September in the case of the pilchard, or as late as the third week in January in the case of the sprat. Reproduction and feeding are the two main purposes which stimulate the migrations of fishes; but these do not explain the obscure movements referred to. Even Pennant ventured to so surmise (*Brit. Zoology*, vol. III., 1759). Of the pilchard, he says, that 'it appears in vast shoals off the Cornish coasts about the middle of July, disappears the beginning of winter, yet sometimes a few return again after Christmas. Their winter retreat is the same as the herring, and their motives for migrating the same.' It is remarkable that fishes so familiar as these clupeoids should present problems so difficult to solve; but as Frank Buckland wrote, and the words are almost the last he ever penned: 'It will be seen that we have a huge field of inquiry before us, the results of which will not assume the form of a scientific plaything; but of a key by which we may hope to unlock the mysteries of the vast ocean.'

(In the preparation of the plates I have utilized my own drawings made from the specimens studied by me; but I have availed myself of the excellent figures published in some of the memoirs referred to in the text. These last-named figures are as follows: Plate VIII., figures 2, 3 after Mr. E. W. L. Holt, 4 after Dr. P. P. C. Hoeck; 6*a*, 6*b* after Dr. F. Raffaele, 8, 9 after Professor W. C. McIntosh, 10 and 11 after Mr. J. T. Cunningham; Plate IX., figures 12-16 after Dr. Ernest Ehrenbaum, 17-19, 21-22 after the late Prof. Ryder, 23-25 after Dr. P. P. C. Hoeck; Plate X., figures 36-38 after Thaddeus Norris.—E. E. P.)

XII

SAWDUST AND FISH LIFE.

FINAL REPORT BY PROFESSOR A. P. KNIGHT, QUEEN'S UNIVERSITY,
KINGSTON, ONT.

The following concludes my report upon the effects of sawdust on fish life. The work was begun at the Dominion biological station, St. Andrews, in 1900, continued at the biological laboratory of Queen's University during the summers of 1901 and 1902, and concluded during the summer of 1904, by a series of observations which were made in tidal waters at different points along the coasts of Nova Scotia and New Brunswick.

LITERATURE.

Since my last report, completed three years ago, no new literature has been published on the subject in Canada, excepting in the annual reports of the Ontario Fish Commissioner for 1902 and for 1903. In his report for the former year the Ontario Deputy Commissioner of Fisheries says:—

'Ample opportunity of determining that sawdust is injurious to fish life has been given to the department while engaged in transplanting its bass, where the ice used had not been thoroughly rinsed. On an examination of the bass which had died in transmission, particles of sawdust were found between the gills, which it may be assumed caused the death of many of the fish. But the danger to and effects upon fish life from this pollution do not alone arise from this cause, but they are also due to the poisonous gases which are emitted from the decaying deposits; and these gases are not only most deadly to fish life, but they are a great menace to human health as well. It may be assumed that for this reason, in waters in the vicinity of old mill sites no fish are usually to be found.'

There are two points in this extract which require some elucidation. The first is the assumption that in transplanting bass, the fish that died on the journey were killed by sawdust. Before admitting this, one would need to know whether all the fish at the beginning of the journey were in vigorous health and strength. Can Mr. Bastedo assure us that the fish which died were not injured when they were being caught? Can he assure us that the water in which they were transported was thoroughly aerated on the journey? If not, the weaker fish and the injured fish would die from suffocation, not from the effects of a few grains of sawdust adhering to the ice. Mr. Bastedo's transportation tank may have been a veritable 'Black hole of Calcutta' for his poor bass!

The other point—that about poisonous gases—is not new to any one who possesses the slightest acquaintance with the literature of sawdust effects upon fish life.

Charles Hallock, writing in *Forest and Stream*, December 29, 1888, says:—'The old foundation walls and dams remain, and untold tons of tan bark and sawdust still cover the beds of the abandoned mill ponds, knee deep, all of it in a perfect state of preservation . . . nevertheless, the brook continues fairly stocked with small trout, despite the supplementary fact that it has been unmercifully fished ever since

6-7 EDWARD VII., A. 1907

the days of the "Mountain Miller," fifty fingerlings per rod being not unusual now for a day's catch.'

In the same magazine a writer who signs himself 'Piscator' answers the boggy about the effects of poisonous gases emitted by sawdust. 'He discourses on the poisonous gases from rotting saw-dust, and I will not waste space in refuting this idea, so flippantly put forth from time to time, but demand that the dead fish from such causes be produced in some single river or stream in America. It cannot be done, hence full-grown men should discard such transparent nonsense.'

Another quotation. Prof. Prince, the Dominion Fish Commissioner, in his report for 1899, says:—'There is no case on record of salmon or shad or any other healthy adult fish being found choked with saw-dust or in any way fatally injured by the floating particles.'

It is to be hoped that these quotations will convince all critics that the only way to settle the question of the effects of saw-dust on fish life is that suggested by Professor Prince, namely, by 'accurate and thoroughly scientific experiments.'

In his report for 1903, Mr. Bastedo again returns to the subject. He says:—

'Referring to the injurious effects of sawdust on fish life, as to which conflicting opinions are expressed by fish culturists, a writer in a recent number of *Forest and Stream* points out that one of the first difficulties which fish culturists had to overcome in the artificial propagation of trout was the deleterious effects of the fungus growth that always appeared in the troughs and boxes in which the eggs were hatched, especially where these were manufactured out of new lumber; and he makes the emphatic statement that this fungus is so deadly to the eggs that if a million were to be put into green lumber troughs, not a single egg would mature. He very pertinently remarks that if the exposed surface in a hatchery trough could be the primary means of such deadly consequences, what a master power for injury there must be in sawdust, in which form the exposed surfaces of the wood are multiplied almost indefinitely. If his conclusions are well founded, the effect of throwing tons of sawdust every year upon the spawning beds, or where it will float and lodge upon the spawning beds below must be most disastrous. In his opinion, it is this fungus alone that destroys the young fish that are exposed to it, and not that mortality occurs by the sawdust becoming fixed in the gills during inhalation, as is generally supposed. Whatever ground there may be for a difference of opinion on the subject, it is well known that fish will abandon streams the beds of which have become covered with this refuse.'

The following is the letter which Mr. Bastedo has summarized in the foregoing paragraph. It is regrettable that an official should try to settle the sawdust question by quotations from an anonymous writer, rather than by the slow and accurate method of scientific experiment. Quotations may be the only contribution which Mr. Bastedo can make, but he might at least furnish the public of Ontario with quotations from some more reliable source than from a nameless writer.

SAWDUST AND FISH LIFE.

(Extract from '*Forest and Stream*,' vol. 61-2, p. 490).

December 19, 1903.

EDITOR 'FOREST AND STREAM,'—Referring to the injurious effects of sawdust on fish life, will you kindly allow me to offer the following notes on the subject, from the fishculturist's point of view:

One of the first difficulties which the early trout breeders in this country had to overcome, was the presence of a fungoid growth that always appeared in the wooden troughs or boxes that the eggs were hatched in. It invariably grew on, and from the surface of, the wood that the troughs were made of, and in all our personal experience in hatching fish eggs, we never knew a single instance, east of the Mississippi, in which fungus did not appear on the surface of the wooden hatching troughs very soon after

SESSIONAL PAPER No. 22a

the water was turned into the troughs, unless the wood was very old or had long been water soaked. In these cases, the fungus does not appear to so great an extent, but when the lumber is new, the fungus, except in highly oxygenated waters, invariably appears very soon after the water comes in contact with the green wood.

This fungus is one of the most deadly things in the world to trout and salmon eggs. It is so destructive that if a million trout eggs were put into green lumber troughs to hatch, they would every one of them be killed before they hatched. Not one would escape. 'Domesticated Trout,' speaking of this fungus (page 126, sixth edition), says: 'Fungus is a vegetable growth of low order, which makes its appearance almost invariably where there is water, and especially on newly cut wood, on which it eventually becomes a mass of nearly colourless or milky slime.

'This fungus, if once present in the hatching water, will certainly attach itself to the eggs, and when it does, their fate is sealed, you cannot save them from its effect, for it never lets go its hold. It will surely eat out the vitality of the embryo within, and will either kill it entirely or will leave a puny, lifeless, transparent creature, which will in all probability never live to grow up. It cannot, therefore, be guarded against with too much care.'

In consequence of this action on the surface of lumber under water, wooden hatching troughs were formerly charred, and now are all covered with a coating of asphaltum, on which fungus does not grow. No fishculturists of any experience would think for a moment of using wood for hatching trout or salmon eggs, without first covering every part of the surface with asphaltum, or something furnishing similar protection against fungus.

Now, if the exposed surface of the three planks which form the hatching trough can exercise such a deadly and universal effect on the fish eggs that are in it, what a vast power of injury there must be in sawdust, in which form the exposed surfaces of the wood are multiplied almost indefinitely. Take an inch board a foot square and reduce it all to sawdust, and it will give an amount of exposed surface almost infinitely greater than the board itself. Then consider what must be the effect of throwing tons of this sawdust every year directly upon the spawning beds of the fish, and where the sawdust will float down to the spawning beds below, if there should happen to be any below. From the moment the sawdust falls into the water it begins to produce the fatal fungus, and makes it absolutely impossible for a fish egg to hatch where it is, and what is more, the invisible fungus which destroys the eggs so effectually, gets into the gills of the young fish that are exposed to it and kills them also; and, besides this, by one of those wonderful instincts that are implanted in the lower animals, fish will avoid a stream where the conditions of spawning are unfavourable, and sooner or later will abandon a stream, the spawning beds of which are covered with sawdust.

The writer trusts that the above considerations are sufficient to show that large deposits of sawdust should be looked upon with much suspicion in streams that are valued on account of the fish life that is contained in them.

SALMO.

Of course, a fungous growth does occur upon fish eggs, but it does not necessarily come from sawdust. It is simply the case of an aquatic plant starting to grow upon organic matter—the eggs, or upon the bodies of the fry when these happened to receive injury in any way. I have seen such growths upon both eggs and fry, and that too in water that never contained a particle of sawdust. Whether this fungus is the same that grows upon rotting wood I cannot say, but of course every intelligent person nowadays knows that the rotting of all wood and trees, and the decay, putrefaction and death of animal tissues are alike preceded and caused by a fungus or bacterial growth which fastens upon the animal in the one case, or plant in the other, and ultimately causes the death of the individual.

But this fungous growth is an entirely different matter from the poisonous effects of sawdust. All wood cells, whether in the tea plant or pine, contain compounds that have been stored in the cell. When these cell contents are liberated and dissolve in

6-7 EDWARD VII., A. 1907

water we get a solution whose poisonous or other effects depend entirely upon the strength of the solution.

The experiments described in my second report showed clearly that the poisonous effect of sawdust water varies directly within the strength of the solution. A strong aqueous extract from sawdust is so poisonous as to kill in a short time nearly all forms of aquatic life. A weak solution is comparatively harmless. The question then of whether any particular stream is sufficiently polluted with sawdust to kill fish life is simply the question of determining whether enough sawdust has been passed into the stream to poison its waters. It is a question of the strength of the sawdust solution. There is no mystery about the matter. Any one who can understand the making of a cup of tea can understand the making of sawdust extracts. If we wish to make a strong cup of tea, we use plenty of the leaves and a comparatively small volume of water. If we wish to make an infusion we use a smaller quantity of the leaves and a larger volume of water. It is the principle which herbalists, druggists and medicine mongers have used for thousands of years. Senna tea, chamomile tea, not to speak of dozens of others, are examples of infusions such as we get by immersing sawdust in water.

Keeping this principle in mind, my work during the past summer consisted largely in ascertaining the quantity of sawdust discharged into a stream in a given time, and the total volume of water passing the mill in this same time.

The first mill visited was one located on the way to Little Harbour, a few miles from New Glasgow, Nova Scotia. The mill supplies lumber to the farmers in the neighbourhood. The timber, chiefly second growth spruce, and a little hemlock, is drawn to the mill during the winter. In the spring, when water is plentiful in the brook, the logs are sawn into boards, the sawdust and smaller refuse being discharged into the stream below.

The logs are all very small, and yield only from 40 to 100 feet per log. The total cut during the past few seasons averaged only 100,000 feet.

Previous to my visit, no rain had fallen for about six weeks, and consequently the mill was not running, on account of lack of water. The only water passing the dam was that from ordinary leakage. Below the mill, the brook was nearly dry. But in the spring and during summers when the rainfall was normal, smelt and sea trout came up to the foot of the mill dam, and were often caught with hook and line at the mill end.

The 'by-wash' at the side of the mill, by which the surplus water escaped when the mill was not running, was a very shallow flume about 14 feet wide, 80 feet long, and from 6 to 9 inches deep during the spring freshets. The total fall was 20 feet, consequently the slope down the by-wash was a very gradual one. The proprietor of the mill was of opinion that sea trout were able to pass up this by-wash and did ascend it every spring. At any rate, sea trout were caught every week by boys fishing in the mill dam. It was a common thing for boys from New Glasgow to go out to this mill pond on Saturdays and take home with them a string of trout in the evening.

Below the mill, there were none of the unsightly beds of sawdust and mill rubbish so frequently to be seen in Ontario streams. The tidal water from the Cumberland straits came up the East river, then ascended the mill stream to the very foot of the mill dam, and in returning carried away with it almost every particle of sawdust and rubbish which left the mill.

In this stream, therefore, there could be no question about the ascent of fish being stopped by mill rubbish. It was all carried down stream and away out to sea. The important question here was whether the ascent of anadromous fish was not stopped by the mill dam. If they were thus stopped, they could not reach their natural spawning grounds above. In this case, one can easily see how the supply of fish is cut off at its very source. My experiments and observations would seem to indicate that over-fishing on the one hand, and mill dams with no proper fishways, on the other hand, are

SESSIONAL PAPER No. 22a

more responsible for depleting our streams and rivers of fish than all the sawdust in all the streams in Canada put together.

Applying the principle of the strength of infusions to the sawdust and water in this stream, we can soon discover whether it is poisonous or not.

The water passing the mill in the spring, when the mill is not working, is a stream 14 feet wide, 6 to 9 inches deep, and flowing at the rate of 18 inches per second. Thus $14 \times \frac{2}{3} \times \frac{3}{2} \times 60 \times 60 \times 24$, or about 1,209,000 cubic feet of water will pass the mill every 24 hours.

Now, as a result of very careful calculations, supplied to me by the Messrs. Todd Bros., lumber merchants, of St. Stephen, N.B., it appears that in sawing logs into one-inch and two-inch boards, about one pound of sawdust is formed for every foot of sawn lumber, board measure. On this basis, 100,000 pounds of sawdust per season would be passed into this stream, and if the mill cut timber for 100 days per season, about 1,000 pounds of sawdust would be mixed with the 1,209,000 cubic feet, or about 75,000,000 pounds of water. Expressing the sawdust in the form of percentage, we find the solution would be .001 of 1 per cent.

Turning now to my laboratory experiments,* we find that a strength of .12 per cent killed a minnow in 20 minutes, and a percentage of .16 per cent killed a minnow in 90 minutes. That is, the pollution in this stream was only $\frac{1}{120}$ of the strength of the laboratory solutions. Of course, these figures are only approximations, but they point unmistakably to the conclusion that this small mill stream emptying into the East river and thence into Pictou harbour, is not polluted with sawdust sufficiently to kill fish life.

The next mill I visited was one on a branch of the Petitcodiac, a river which flows into the Bay of Fundy. The proprietors gave me the following information: The quantity of lumber that is cut ranges from thirty to forty thousand feet per day, during a season of five months, say 4,500,000 feet of lumber. The stream in high water is about 220 feet wide, and from 5 to 6 feet deep. The average velocity is 2 miles an hour. In August, when I was there, the stream was only about 50 feet wide, and the depth did not exceed 12 or 15 inches. Consequently, if we average these estimates it will be found that about 700,000,000 pounds of water would pass the mill every 24 hours. The sawdust, at the estimate of 1 pound for every foot of lumber cut, would amount to 35,000 pounds per day, or expressing these figures as percentage strength of solution, about .05. Here, again, therefore, there can be no doubt that sawdust does not kill fish life. But, here again, there are mill dams upon the stream with no proper fishways, and consequently anadromous fish cannot pass up to their spawning grounds. Add to this the fact that this and similar streams are all overfished year after year, and the amazing thing is that any fish are left in them at all.

AT ST. JOHN, N.B.

On arriving at St. John, I visited a number of the lumber mills and obtained a vast amount of information from a member of one of the largest lumber companies in the city. The annual cut of each firm, the kind of saws used—whether gang, band, or circular saw—and the mode of disposal of the refuse, were all carefully discussed. None of the mills in the immediate vicinity of St. John empty the sawdust into the river, but a few large mills and a considerable number of small ones far up the river and its branches, do discharge the sawdust and other refuse into this stream.

While, therefore, little refuse in the shape of slabs, edgings, butt ends, or bark, could be seen for many miles up the river, and no trace whatever of sawdust; yet, gradually, as I reached a part nearly halfway to Fredericton, there appeared evidence of the work of the lumber mills. Edgings, laths, logs, and sawdust were seen either floating or stranded plentifully along the shore. Opposite and above Maugerville this was

* See my 'Further Report' to Minister of Marine and Fisheries, published, 1906.

specially the case. The commonest kind of logs were spruce and cedar, and mingling with these a few pine.

In the upper half of the journey to Fredericton, a number of small sawmills were noticed here and there along the shore. Evidently they were doing a purely local trade. Quite a number had been abandoned. Nine miles from the capital there was brisk rafting of logs, no less than four steam tugs being employed in this work. The booms and logs extended for 4 or 5 miles along the river. All the mills along this part of the river were driven by steam and burnt their own sawdust.

Between St. John and Fredericton, therefore, there is no doubt that neither the rubbish nor the sawdust exists in sufficient quantity in the river to do any harm to fish life. But it becomes a matter of interest to ascertain, if possible, what the effect would be if the refuse from all the mills at St. John and up the river did discharge their sawdust, slabs, edgings, &c., into the stream. Because it must be remembered that up to 1899 the law against discharging mill rubbish was not enforced upon the St. John river, and certain other large rivers in Ontario and Quebec, inasmuch as parliament thought it only fair to the lumbermen to allow them the privilege of getting rid of their waste lumber in the easiest possible way.

Assuming then, that mill waste were discharged into the St. John river, what would be the effect? If it would poison fish eggs, fish fry, or the minute microscopic life which forms the food of fish fry, we can easily understand that this would be one reason why fish have decreased in number in this river during the past 30 or 40 years. Let us see. According to the information I received from lumber merchants in St. John, the following is a fair estimate of the cuts of lumber on this great river during the last year or two:—

	Feet, board measure.
Messrs. Burns & Murchin	10,000,000
“ Hilliard Bros.	10,000,000
“ J. R. Warner & Co.	10,000,000
“ A. Cushing & Co.	43,000,000
“ Murray & Gregory	15,000,000
“ Stetson, Cutter & Co.	30,000,000
“ Randolph & Baker	20,000,000
“ Dunn Bros.	10,000,000
“ John E. Moore	10,000,000
“ Miller Bros	23,000,000
M. A. Gibson	40,000,000
The Scott Lumber Co.	10,000,000
Messrs. Murchin & Sons.	5,000,000
R. A. Estey	7,000,000
A. Fraser	10,000,000
Tobique Lumber Co.	10,000,000
Van Buren Lumber Co.	13,000,000
St. John Lumber Co.	33,000,000
Geo. Murchin.	8,000,000
A number of smaller mills on the St. John and its branches in Canada and the United States. . .	90,000,000
	407,000,000

Now, on the assumption that each foot of lumber, board measure, will produce a pound of sawdust, the total sawdust would of course amount to 407,000,000 pounds per annum.

So much for this part of the data required to find the strength of the sawdust pollution of the St. John.

SESSIONAL PAPER No. 22a

According to the Hydrographic Survey of the State of Maine (Walter Wells, superintendent, 1869), the total drainage area of the St. John river is 26,000 square miles, of which 7,400 lie in the State of Maine. The annual discharge from the area in Maine is 284,000,000 cubic feet. Using this as a basis, it follows that the annual discharge from the whole area will amount to about 1,000,000,000,000 cubic feet, or 62,000,000,000,000 pounds.

On the assumption that the saw mills run for about two-thirds of the year, say 200 days, it will follow that 407,000,000 pounds of sawdust mingle with about (40 trillion) 40,000,000,000,000 pounds of water. Expressing this in the form of percentage strength of sawdust solution, we get .001 as the result.

Comparing this again with my laboratory experiments, in which a solution of .12 per cent strength killed a minnow in 29 minutes, and another solution in which a strength of .16 per cent killed in 90 minutes, we see that even if all the mill refuse were discharged into the St. John the pollution would not be great enough to kill fish.

Moreover, we must make two allowances in the case of the St. John river. In the first place, much of the lumber is spruce, and according to my laboratory experiments of 1902, spruce sawdust was the least poisonous of all. In the second place, it must be remembered that St. John is the scene of the great reversible falls. During two periods of every 24 hours the St. John river falls into St. John harbour. During two other periods of the day the salt water of the Bay of Fundy pours into the mouth of the St. John river, the tide effects being felt as far up the river as Fredericton. This immense body of salt water, therefore, mingling with the fresh water of the river, lessens the strength of the sawdust pollution at the mouth and renders it still less likely to do harm.

BAY OF FUNDY.

One would suppose it quite as likely to hear that the Atlantic was polluted with sawdust as to hear that the Bay of Fundy was. And yet that is precisely what could be heard among the fishermen along the Bay of Fundy in 1877 and 1879.

In 1889, the late W. H. Rogers, inspector of fisheries, published what was known as *The Suppressed Sawdust Report*. Writing in reference to pollution of the Bay of Fundy, he says (page 2 of his pamphlet):—

‘It has been stated that the falling off in the catch of shad in the Bay of Fundy was caused by sawdust; that fish swallowed it, and died in large numbers in consequence. The fact that ideas of this kind gained some credence led me to inquire more carefully into the matter, but not for my own satisfaction, because no such doctrine could be accepted by any one with the most limited knowledge of the habits of fish, or the natural laws governing them. The same idea had been exploded several times before in the case of other branches of the fisheries, notably the Digby herring fishery. My views and reports on this fishery will be found on file in the year 1879, and it will be seen that the state of that fishery since has fully sustained the position I maintained at that time. The average annual catch from 1870 to 1879, ten years, was 22,300 boxes, and from 1880 to 1887, eight years, 55,200 boxes. During the years 1877 and 1879, when the annual catch fell to about 5,000 boxes, sawdust was pointed to as the cause, and numerous signed petitions were sent to the government pressing for the enforcement of the law. My view was stated to be that the decrease was merely owing to a periodical fluctuation, with which sawdust had nothing to do, and that the fish would return in as great abundance as ever. And I appeal with full confidence to the facts, as stated, substantiating my view after an experience of nine years has thrown its light upon the subject. In 1887 the catch of Digby herring amounted to 74,135 boxes; the catch for 1888 is only 12,200. We may, therefore, expect again that large numbers of petitions will be sent to the government asking the enforcement of the sawdust law, so as to save the Digby herring fishery from destruction.’

THE STE. CROIX RIVER.

Returning again to the immediate subject of my report, I would like to call special attention to the conditions found at St. Stephen, N.B., on the Ste. Croix river.

This river has been the scene of lumbering and milling operations, I suppose, for over a hundred years. At first the trade was an export one with the mother country, the lumber being in the form of square timber. The many old wharfs at St. Andrews now in a state of utter decay may be taken as an index of the extent of these early lumbering operations. That a great deal of wealth was accumulated in these early days, both at St. Andrews and St. Stephen, from the trade in timber, is attested also by the remains of many fine private residences and grounds still to be seen in every street of these towns, but especially in St. Stephen.

Gradually, as the character of the lumber trade changed from the manufacture and export of square timber to that of deals and boards, the centre of this business shifted from St. Andrews to St. Stephen, because here there was magnificent water power. At one time—some thirty years ago—there were not less than 13 large sawmills at St. Stephens, all discharging every pound of their sawdust into the Ste. Croix river. To-day there is not one-third of this number. The sawdust is still discharged, however, into the river, excepting that from cedar shingles, which is carted away and burnt.

During the many years that sawing has been carried on here, millions of tons of sawdust must have been passed into this river. When the tide is out, the sawdust is carried down below the town by the river's current, so that for practically a mile below, little or no sawdust accumulates along the banks. But beyond this point, for a distance varying from $1\frac{1}{2}$ to 3 miles, immense beds form, especially during July, August and September, when the water is low in the river. During the freshets of spring these beds are washed down and away out into Passamaquoddy bay.

Here then, if anywhere in Canada, we ought to find fish killed by thousands as a result of the fungus growths, poisonous gases, or other effluvia which have been so graphically described by those who have written upon the ill-effects of sawdust. But, strange to say, so far as I can learn, no unusual death rate among fish has ever been reported along the mouth of the Ste. Croix. On the contrary, there has been only the usual decrease in the catch of anadromous fish, such as has occurred along almost every river in the maritime provinces. The decrease has not been due to the effects of sawdust, but to deforestation, to overfishing, and to lack of fishways, or improper fishways, so that anadromous fish cannot pass up the rivers to their natural spawning grounds.

Moreover, Mr. Frank Todd, an unusually well-informed man upon all fishery matters, a gentleman who has been inspector of fisheries for this district for a number of years, tells me that he has caught hundreds of salmon at the tail end of the lowest mill on the river, where sawdust would naturally be most abundant; and that during every season for years he has watched salmon ascending the river towards their natural spawning grounds above.

Looking at the mills, the sawdust, the fishways and the annual catch of salmon by anglers, it is quite clear that sawdust has not destroyed the salmon fishing on the Ste. Croix river.

Turning now to look at the subject from the point of view of an infusion of sawdust in water, what do we find? Well, we find this: The annual cut of lumber at St. Stephen, board measure, is, according to Mr. Frank Todd, about 35,000,000 feet. According to Mr. Wells, from whose report I have already quoted, the annual outflow of water of Ste. Croix is 44,800,000,000 cubic feet, or, expressed in pounds, 2,800,000,000,000.

Now, if we express the weight of sawdust as percentage of the weight of water for two-thirds of the year, which is about the length of time that the sawmills run each year, we shall find that the solution is one of .002 per cent strength.

SESSIONAL PAPER No. 22a

Comparing this with fatal doses of sawdust poison as determined in my laboratory experiments already alluded to, it can easily be seen that no harm can be done to fish fry or fish eggs by the water at the mouth of the Ste. Croix river.

Moreover, another important factor must be taken into account. Tidal water rises about 3 feet at the ends of the lowest mills on the Ste. Croix. The sawdust is discharged, therefore, not into 123,000,000 cubic feet of river water daily, but into this amount of fresh water plus the tidal water of Passamaquoddy bay. This tidal water is of immense volume. When the tide is out the river averages 50 yards in width and four feet in depth for 5 miles below the mills. When the tide is in, this increases to 150 yards in width and 20 feet in depth. In other words, the volume of water into which the sawdust is discharged becomes fifteen times larger, and the strength of the solution becomes fifteen times less. Consequently, in tidal waters sawdust pollution is diminished and the poisonous effects, if any, are still further reduced below what they would be in a river that did not discharge into the sea.

CONCLUSIONS.

1. I submit the same general conclusion as I did in my report for 1902. No stream can be pronounced off-hand as poisoned by sawdust. Each stream must be studied by itself and the varying conditions must be thoroughly understood before a judgment can be pronounced. The chief things to be considered are (1) the quantity of sawdust and (2) the volume of water into which the sawdust is discharged. Subordinate conditions are the rapidity or sluggishness of the stream, the amount of sunlight or shade and the character of the water, whether from agricultural lands or from primitive forests.

2. I have not the slightest hesitation in saying that no stream or river which I have yet studied in Ontario, New Brunswick, or Nova Scotia, is sufficiently polluted with sawdust to destroy half grown or full grown fish.

3. The varying strengths of sawdust solutions that will kill different kinds of fish eggs have not yet been determined. Perch eggs were hatched out in the university laboratory in a solution of .03 per cent strength.

4. In place of sawdust being the potent factor in the destruction of fish life, it would seem likely that mill dams are the real cause. Mill dams without proper fishways prevent the ascent of anadromous fish to their natural spawning grounds, and thus cut off all chance of natural propagation. As suggested in a recent report by Professor Prince, the question of the adequacy of fishways is a vital one to Canadian fisheries.

5. It would seem more reasonable to amend the Act against passing sawdust into streams, and make it approximate to that in force in the State of Massachusetts. In this state, it is provided that whenever the Fish and Game Commissioners should decide 'that the fish in any brook or stream are of sufficient value to warrant the prohibition or regulation of the discharge of sawdust from sawmills, and that the discharge thereof from any particular sawmill materially injures such fish, they could restrict the pollution by an official order.'

This would compel a personal inspection of a stream before an order could be issued to stop its pollution by sawdust. In this way both the interests of millowners and of the general public would be carefully weighed before the law would be placed in execution.

XIII

PROFESSOR MACALLUM ON THE CHEMISTRY OF MEDUSÆ.

A CONDENSED RÉSUMÉ OF RESULTS

BY PROFESSOR EDWARD E. PRINCE.

Commissioner of Fisheries and Director of the Marine Biological Station of Canada.

A detailed account of the laborious researches of Professor Macallum, F.R.S., on the inorganic composition of certain marine jelly-fishes or medusæ, appeared in the *Journal of Physiology*, Vol. XXIV., pp. 213-241. These researches were commenced in the summer of 1900, at the Marine Biological Station of Canada, and were continued during several seasons, with results so interesting in themselves and so suggestive in their theoretical bearings as to justify repetition in an abbreviated popular résumé. The conclusions which they appear to reasonably yield are, indeed, of such profound biological significance that I have ventured to prepare a condensed summary, divested as far as possible of technical phraseology.

The medusæ are amongst the most familiar of sea-side objects. These disc-shaped *Ctenophorates*, variously called jelly-fishes, sun-fishes and sea-nettles are, as Dallas said, 'wonderfully beautiful creatures, though the amount of solid matter contained in their tissues is incredibly small. The greater part of their substance appears to consist of a fluid differing little, if at all, from the sea-water in which the animal swims, and when this is drained away, so extreme is the tenuity of the membranes which contained it, that the dried residue of a jelly-fish, weighing two pounds, which was examined by Professor Owen weighed only thirty grains.*' The fluid or so-called jelly substance is, however, as Professor Macallum's researches show, not identical with sea-water. Professor Macallum began his investigations by placing jelly-fishes in vessels of sea water of various strengths, and by altering the proportions of individual salts, he endeavoured to ascertain the action of the salts upon these living organisms. As the exact composition of the jelly-fishes themselves was unknown, it soon appeared to him that no conclusive results were possible until the composition of the medusæ had been ascertained. Two species, it may be mentioned, were specially studied, viz.: *Aurelia flavidula*, Peron and LeSueur (closely allied to the European *Aurelia aurita*) and *Cyanea arctica*, the first-named ranging from 5 to 10 inches in diameter, in the late summer months when it is mature, while the last-named (*Cyanea*) may reach a size of 3 to 5 feet across the disc, although smaller examples are most common. Specimens of *Cyanea arctica* are on record having a diameter of not less than 7½ feet, and possessing tentacles over 120 feet long.†

Owing to their simplicity of structure, especially their histological features, there is a prevalent impression that jelly-fish imbibe, in sponge-like fashion, any fluids by which they may be surrounded, and Professor Loeb, of Chicago, has published the opinion that the existing chemical environment normally affects directly, not only the chemical constitution of medusæ; but their physiological activities as well, to a remarkable extent. The swimming motions or pulsations of *Aurelia* and *Gonionemus* are dependent, he declared, upon the presence of sodium, calcium, and potassium ions in their sea-water environment. Professor Loeb instanced an experiment in which a ring-like portion of the margin of *Gonionemus* was cut away, and the usual locomotor pulsations ceased in ordinary sea-water; but, when placed in a $\frac{5}{8}$ normal solution

*Natural History of the Animal Kingdom, London, Griffin & Co., p. 70.

†Rolleston's Forms of Animal Life. 2nd Ed., Oxford, p. 788.

(i.e. 3·6 per cent) of sodium chloride. it rhythmically contracted for an hour or more. He decided that the margin differed from the centre of the disc in that species, and contained sodium, calcium and potassium ions in different proportions. The pulsations in the case of *Aurelia* did not cease after its margin had been cut off. Dr. Macallum found, however, that the contractions of the disc of *Aurelia* were rare and feeble in ordinary sea-water, after cutting away the margin of the disc, though very vigorous in the $\frac{2}{3}$ normal solution of chloride of sodium; but he concluded that the salts did not act directly on the tissues, e.g., the nerve cells, muscles, &c., as Dr. Loeb thought; but on the nerve endings in the epithelium of the lower surface of the jelly-fish, usually called the sub-umbrella. This was clear from the fact that all contractions ceased when a 0·08 per cent solution of formalin in sea-water was gently brushed over the surface, or when the surface was so stroked with the back edge of a scalpel as to scrape the epithelium. These ectodermal cells, or epithelium elements, which form the thin covering over the gelatinous bell (mesoglœa) possess no markedly contractile character, and have assumed, in the morphologist's view, a function practically sensitive and protective alone, 'they have largely given up,' as the late Professor T. Jeffery Parker said, 'the function of contractility to the muscle processes or fibres.' This layer of living ectoderm prevents that direct influence, and interchange, which Professor Loeb regards as exercised by the chemical environment of the medusæ. Any rapid exchange between the outside medium and the salts in the tissues of the jelly-fish is barred, otherwise the composition of the 'jelly,' which forms so large a portion of the disc, would change with every change in the sea-water in which the creature floats, e.g., in passing from ocean water to brackish, and *vice versa*.

The gelatinous tissue or jelly is really a supporting lamella between the endoderm and ectoderm layers, but immensely thickened, as compared with the mesoglœal lamella in *Hydra*, and it is very effective in impeding the exchange referred to, and indeed, in preventing the diffusion of foreign matters. Methylene blue, injected by a hypodermic needle into a vigorously pulsating *Aurelia*, was found to stain one spot only, and it was not possible to detect any spreading-out of the colour even after 24 hours interval. While the prevention of the diffusion of foreign substances is secured on the one hand, and the retention, on the other hand, is ensured of fluid and inorganic matters, the loss due to injury is also minimized and repairs to the surface are facilitated, even when such injuries are extensive. Thus, a third of the disc may be removed; but the naked cut surface is soon overgrown by a cuticle of small and glistening epithelium cells. The jelly consists of a minutely reticulated meshwork of proteid, called discin, which retains water and inorganic salts, and by its excessive firmness resists diffusion and osmosis so long as the trabeculæ are maintained. Though the epithelial cuticle interposes a barrier against rapid exchange between the watery environment and the disc substance, and the mesoglœa itself resists the diffusion of foreign matters, yet the epithelial cells of the surface of the bell, and the lining cells of the gastro-vascular canals, exercise a remarkable selective power. They take in some chemical matters and reject others in the most unmistakable manner.

Before referring to the details of this interesting selective action of the cells as living units, and to the methods adopted by Professor Macallum in his researches, it may be necessary to point out that the composition of medusæ has engaged many observers. Krukenberg found in *Rhizostoma Cuvieri*, from the Adriatic, that the solids were 4·608 per cent and the organic 3 per cent; in *Aurelia* the solids were 4·2056 and 4·66 per cent, and in *Chrysaora hyoscella*, the percentages of solids were 4·25 and 3·7. Ladenburg found in two examples of *Aurelia aurita* from the Bay of Kiel, where the surface salinity is 1·7 to 1·8 per cent on the average, that the solids were 2·06 in one example, and in another 2·1 per cent. Krukenberg also attempted the estimation of the chlorine in medusæ from different localities, and found that *Aurelia* from east of the mouth of the Rhone showed 1·5975, and *Rhizostoma Cuvieri* showed 1·65075 per cent, as compared with specimens of *Aurelia* from the Gulf of Trieste and the Red Sea, which showed a percentage of chlorine as follows: 1·79275, 2·0306 and 2·2223, when

SESSIONAL PAPER No. 22a

the water of the sea contained respectively, chlorine percentages as follow: 1·8105, 1·931 and 2·0945. Other medusæ, from the same sources, Krukenberg found to contain chlorine greater in amount than in the surrounding sea-water, and he stated that in medusæ from waters of low salinity, their salinity was relatively much higher than in medusæ from sea-water of high salinity. He also found that a piece of jelly (in sea-water of 2·1868 per cent of chlorine) gave a fluid containing 2·334 per cent of chlorine; while, when the sea-water contained 2·272 per cent, the jelly fluid showed 1·345 per cent of chlorine—a most remarkable result, due to diffusion laws. Whether the loss of water, however, was owing to exudation or to mechanical processes, Krukenberg could not decide. In distilled water pieces yielded, he found, 4·93 and 4·13 per cent of chlorine, and in a medium containing magnesium sulphate only, the loss of salts decreased with the increase in the strength of the sulphate. A 6 per cent solution showed 4·33 per cent in the fluid given off, while in a 10 per cent solution it was 4·34 per cent; but in a 20 per cent solution the chlorine in the fluid was 3·229 and 3·666. With solid magnesium sulphate placed on the fragment of jelly, the fluid given off contained from 1·292 to 1·596 per cent of chlorine.

For the purposes of the St. Andrew's investigation it was necessary to have ample material to enable adequate analyses to be made. Hence a juice was prepared from living specimens of jelly-fish. The specimens were suspended in muslin bags in the station laboratory, for about ten minutes, so that the sea-water on the outside, and in the gastro-vascular canals internally, could drip away.

After this draining the specimens of *Aurelia* were subjected to a mincing process by hand, and the fine minced jelly was, after a second straining, kneaded thoroughly until liquified. The strained fluid, mixed with the kneaded material, presented a turbid appearance until the cellular elements settled, when the liquid was opalescent. Crystals of thymol were used for preserving samples, or else 2 cc. of formalin to 1000 cc. of the fluid. This fluid was stored in phials having tight-fitting glass stoppers.

As the canals in *Cyanea arctica* continue into the long dependent filaments, more time was necessary for the draining process in that species; but even after the lapse of an hour some sea-water still remained. There was in consequence of longer suspension some loss of organic material.

The specimens of *Cyanea* were then allowed to liquify spontaneously, after being broken up, and in the course of twenty-four hours a brownish red liquid resulted, in which the ropy tentacles remained undissolved. This was preserved by adding 2 or 3 cc. of formalin to 1000 cc. of the fluid. Preservation was satisfactory, but a precipitate settled in the *Aurelia* fluid, consisting largely of magnesium hydrate in union with some proteid matter. The medusa fluid or juice was subjected to elaborate analysis by Professor Macallum in the physiological laboratories of the University of Toronto, and the details require, of course, to be studied in the original paper, but the main results may here be summarized:—

(a) The sulphuric acid is much below that of the surrounding sea-water, absolutely and relatively.

(b) The magnesium is less than in sea-water, in *Cyanea* as much as 10 per cent less.

(c) The lime is the same as in sea-water at St. Andrew's and Canso in the case of *Aurelia*; but in *Cyanea* it is greater.

(d) The potassium shows the greatest disparity, being in *Aurelia* 40 per cent in excess of the amount in the sea-water and in *Cyanea* 100 per cent greater.

The selective action of the living cells forming the exterior covering and the internal (gastro-vascular) lining, is responsible, there can be no doubt, for the relatively large amount of potash salts taken in, and the ratio of the proteid nitrogen and phosphorus in one as compared with the other, viz., 1:2·5 is corroborative. The slight decrease in the sodium may be due to its replacement by potassium. The difference of the aqueous environment at St. Andrew's and at Canso explains the difference in the analyses of the specimens of *Aurelia* from the two places. Their subjection every

6-7 EDWARD VII., A. 1907

twenty-four hours to greater variations at St. Andrew's than at Canso during embryonic and larval life is the likely explanation. At St. Andrew's the extremes are no doubt in April and August, but at Canso the range of variation is limited, and due to the depth, &c., of the adjacent waters. The following chlorine determinations show this:—

Surface water, Canso, chlorine 1.6543.

Atlantic outside of Canso, chlorine, surface, 1.6032; 10 fathoms, 1.6302; 25 fathoms, 1.7262; 50 fathoms, 1.7476.

The degree of salinity in the surrounding medium affects little the presence of chlorine in medusæ. If once a salt of sea-water is appropriated by the jelly, it remains there for life, and any exchange must inevitably be slow. The jelly favours fixity and uniformity of concentration, and the epithelium cells are effective as a barrier. Professor Macallum's view is that heredity must be the cause of the selective power, whereby the cells accept the lime and sodium salts on the whole as they are in sea-water, and take in also the potash, but reject some of the magnesium and sulphuric acid. Whether, however, a power of choice was inherent from the first in medusæ, or developed as an acquired function, must be decided by the conditions regarded as obtaining in their ancestral progenitors, and the sea-environment in which they existed in past geological times.

Cœlenterates are a primitive type, indeed, the *Graptolitidae* of the Silurian age, and the Silurian and Devonian *Stromatoporida*, are generally regarded by palaeontologists as hydroids, and there can be no question of the remains of Jurassic medusæ in the Solenhauten slates, and of at least one Cretaceous medusa; and the reference of these ancient forms to the order of (Craspedote) Trachymedusæ, and to certain orders of the *Acraspeda*, shows a striking stability in their morphological and structural features.

What must have been the environment of the early jelly-fishes? What were the surrounding conditions in the primitive seas which determined for these ancestral Hydrozoans that fixity of inorganic composition referred to? Professor Macallum points out that the primal seas, when life first appeared, must have contained a less quantity of salts, derived from the more readily decomposable rock materials, under the enormous atmospheric pressures, and at the high temperatures, at which vapour condensation first took place.

Biologists are well aware of the fact that the simplest forms of animal life (such as the Protozoan form *Amoeba*), while intolerant of extremes of heat, become sluggish as the temperature rises above 15° C. until at 30° or 35° C. movements cease altogether, but may be restored by lowering the temperature. If, however, the heat be raised to 40° C. heat rigour is produced, the protoplasm coagulates and the organism dies. There is, of course, a certain percentage of salts in solution in the fresh water in which *Amoeba* lives.

The sudden addition of 2 per cent of the chloride of sodium at once produces dry-rigor and general shrinkage; but if the change be gradual *Amoeba* will live in a 4 per cent solution, i.e., one twice as strong as that which results in dry-rigor, if the change is sudden. *Amoeba* has no barrier-membrane or cellular layer, but merely an ectosarc or slightly differentiated protoplasmic stratum externally. The contrast between the Protozoa and the Metazoa renders deductions unsafe, but, after all, Medusæ are low in the scale. Experiments with a remarkable fresh-water Medusa (*Crapedacustas soverbii* Allm.*) discovered in the Royal Botanical Society's Gardens, Regents Park, London, some years ago, are interesting in this connection. Marine Cœlenterates are not very tolerant of fresh-water, and the Medusa just mentioned is the only non-marine jelly-fish known. Romanes found that it was even more intolerant of change. Dropped into sea-water at 85°F. (being a tropical species) it remained unaffected for 15 seconds, then there were two or three tonic spasms, lasting

*Professor Ray Lankester named it *Limnocodium* at the time of its discovery. See *Nature*, Vol. XXII., 1880 (pp. 147, 177, 361, &c.).

SESSIONAL PAPER No. 22a

a few seconds, but in 30 or 40 seconds these faded into irregular twitchings. It became contracted and quiescent at the end of the first minute. On being replaced in fresh-water a strong spasm occurred after five minutes had elapsed, and for 20 minutes there was no motion. Irritability continued for some hours, as proved by pinching with forceps, but the effects of the sea-water immersion proved fatal. It was found to live for some hours in brackish or very weak salt-water (1 in 12, or 1 in 15), and it lived for days in a still weaker solution (1 in 18). Marine jellyfish cannot endure a high temperature, indeed 70°F. is fatal; but this fresh-water form withstood 100°F.—its pulsations being 80 per minute at 65° to 75°F., while they increased to 130 per minute at a temperature of 85°F. Freezing killed *Crapedacustas*, whereas marine species have been frozen and on being thawed out, they swam about as usual. Again, marine species survive for hours in saturated brine, as Romanes proved. There is a parallelism, as Dr. W. B. Carpenter long ago pointed out between morphological differentiation and physiological differentiation, and the physiologist may well be impressed by the diverse animal forms, amongst the Metazoa, which are able to maintain a vigorous vitality in the midst of greatly changed or changing external conditions. They have within themselves the power of compensating for these changes in an extraordinary degree. Above all, the specialized and complex organization of man possesses surprising capability of resistance to, or rather, independence of, environmental changes. He is capable 'of sustaining the highest as well as the lowest extremes of temperature and of atmospheric pressure,' to quote from the distinguished authority just referred to. This resistance to varying external changes, is an inherent potency by which organic individuality is to no small extent maintained.

To return from this excursus to Professor Macallum's investigation, it seems clear that while the inorganic composition of *Aurelia* and *Cyanea* has acquired comparative fixity, the adaptation of these forms to changes in chemical environment is incomplete and variable. When the salts in sea-water were less abundant than they are now the medusæ would, doubtless, acquire a fixed relation to the relatively concentrated potash salts, while more tolerant of the salts of soda, as they became more concentrated. More than the usual amount of potash salts would be absorbed, in order to retain the physiological equilibrium; but this excess would diminish as the cells accommodated themselves to the altered relation between the potash and the soda salts. The power of taking up sodium and magnesium compounds would increase though not to such a degree as to take in the full amount present in sea-water. Further, the power to select lime would early approximate to the limit of the amount in sea-water.

The amounts, absolute and relative, are detailed in the following table:—

That the amount of sulphuric acid is much below that in sea-water, both absolutely and relatively in *Aurelia* and *Cyanea*, is very noteworthy, and its slow rate of increase in sea-water must be the explanation of the low proportion. There are three equivalents of acid to one of lime in sea-water; but in river-water the acid equivalents are much smaller than those of the lime. Apparently it was not possible for the Medusæ to accommodate themselves to these external constituents in the same degree, owing no doubt to the physiological rate of accommodation being slower for sulphuric acid. The degree of accommodation to each constituent of sea-water varies very much, resulting in a deficiency in the case of sodium of 3-4 per cent, of magnesia 5-10 per cent, and sulphuric acid 32-36 per cent.

While these speculations are offered by Professor Macallum with reserve, they give interest to the well-known fact that some salts are relatively more abundant in their vascular fluids than in the media in which animals live, or than in their food.

The proportions of sodium, calcium and potassium, omitting for the moment magnesium, in the *Aurelia* and *Cyanea* juice, are strikingly similar to their proportions in mammalian serum and in Ringer's solution*, and indicate that these proportions in plasma are primitive and ancestral, and must date from a geological epoch when sea-water was poorer in salts of magnesia than it is now. In vertebrates and invertebrates of old, as in the Medusæ of to-day, the fluids in the vascular system might be compared to modified sea-water, so far as its inorganic constituents are concerned, and the physiological relation between the tissues and the salts in their vascular fluids, fixed primitively, continued hereditarily to their descendants, whether they changed their habitat from the sea to fresh-water or to the land. The low proportions of magnesium to sodium in vertebrate blood, and the high proportions in sea-water, must have been established when magnesia was less abundant than now in sea-water.

The view propounded by Professor Macallum implies that in the sea originated all animal life. 'The sea,' August Weissmann indeed declared, 'is the birthplace of all animal and plant life; and from it animals and plants have spread on to the land and into the fresh waters which permeate it.'

The jellyfish tissues have, it is clear, accommodated themselves to the high and increasing magnesium content of the ocean. Professor Loeb's idea that sodium ions are poisonous in sea-water, and may be antagonized by calcium and potassium ions in the tissues, mistakes and obscures the significance of the problem. The animal cell, exposed for ages to the three elements in its environment, has adapted itself to them, and the proper explanation of the third element's action is, that such a mixture of the solutions reproduces the primitive fluid-environment of the creature, hence the terms 'poison' and 'poisonous' are inapplicable.

*Ringer's solution is a mixture of salts favourable for the development and maintenance of contraction in cardiac and ordinary striated muscle.

SESSIONAL PAPER No. 22a

The physiological habit, established ancestrally, is maintained. Loew's idea that, because potassium salts favour chemical condensation-processes, this accounts for the high selective capacity for potassium possessed by animal and vegetable organisms, fails, however well-founded, and does not explain why medusa cells pack such salts away in the inert or dead jelly of the bell.

Reference may be made to other salts, small in quantity but important, and conveniently omitted in estimating the total sum of salts in sea-water and in the juices of medusæ. There is apparently no alumina in *Aurelia* and *Cyanea*, while the silica detected is so small in quantity that it may be due to sand particles, protozoan skeletons, &c., in the gullet and gastro-vascular canals, though the jelly of *Aurelia* may contain silica, as sponges and cœlenterates, of course, can utilize the silica of sea-water. The iron present is, in St. Andrew's *Aureliæ*, ·0036 to ·004 per cent, and in Canso *Aureliæ* ·00087 (volumetrically), while in Canso *Cyanea* it is ·001796 to ·00207 per cent, whereas St. Andrew's sea-water contains only ·00006 per cent and Canso sea-water slightly more, viz.: ·00098 per cent. Phosphoric acid in *Aurelia* juice contains ·013314 per cent and *Cyanea* juice ·030315 per cent, but it must be noted that only a small portion exists in inorganic combustion, the rest being from nucleo-proteid and lecithin. Bromine in sea-water, according to the late Professor Dittmar, is ·3402 of the total halogen, and in *Aurelia* from Canso, with a total halogen of 1·723, it would be ·00586 per cent. Iodine, in 50 litres of sea-water, amounted to ·0006, yet in contrast to analyses of sponges, repeated and careful tests with *Aurelia* and *Cyanea** failed to show the presence of that element. Another method showed its presence, but only ·00001 to ·00025 in 50 litres, and probably minute animals account for it. A very large quantity of the juice is necessary to determine its presence.† Does the gastro-vascular lining (i.e. the epithelial cells) reject iodides in sea-water, just as the sulphuric acid is rejected? If so, that is the explanation of the much smaller amount of iodine the medusa contains than the sea-water contains, in which it lives.

The conclusions yielded by the very elaborate and careful analyses of Professor Macallum, and summarised in the final pages of his paper, may be concisely stated as follows:—

1. Medusæ differ in their chemical composition, as regards salinity, from the sea-water in which they live, and two species differ from each other, in the same water and on the same day. Specific individuality is not signalized by morphological and anatomical features only, but is indicated by inorganic chemical composition as well.

2. The salinity of the sea-water environment may vary considerably, but affects very inconsiderably the salinity of organisms like medusæ.

3. Salts, once deposited in the jelly of living medusæ, are unaffected by osmosis while they continue to live in sea-water.

4. The sodium in medusæ is slightly less, and the potassium considerably more, than in the sea-water, taking the total halogen as the standard. The lime is about the same as in the sea-water, but the magnesia is less (as much as 10 per cent less), and the sulphuric acid very much less (32 to 35 per cent) in the medusæ.

5. The iron is more, and the iodine less, in medusæ than in sea-water; and the latter is apparently not associated with any compound which can be precipitated by alcohol.

6. The lining cells of the medusa's digestive system are living units, which exercise selection in absorbing the salts of sea-water, and this selection is more vigorous in respect to some constituents than others.

* 2 litres of the juice were used.

†The total amount of proteid in *Aurelia* is very small, only $\frac{1}{4}$ to $\frac{1}{8}$ per cent of its total weight; thus 2,000 cc. of juice only yields a total of 2·6 grains of proteids.

6-7 EDWARD VII., A. 1907

7. The different selective preferences exercised are explained by the past history of the sea-water environment. Magnesia and sodium steadily increased, but lime and potassium must have reached their present proportions ages ago; and the internal epithelial cells of medusæ accommodated themselves accordingly, although they have not yet accommodated themselves to the increasing sodium and magnesia.

8. The inorganic composition of medusæ, as shown by Professor Macallum's researches, reflects the composition of sea-water less of to-day, than of past geological periods, possibly very remote periods.

HON. LOUIS-PHILIPPE BRODEUR,
Minister of Marine and Fisheries

SIR,—I have the honour to submit herewith the Supplement to the thirty-ninth Annual Report of the Marine Branch of the Department of Marine and Fisheries, being for the year 1906, containing a statement of merchant shipping, wrecks and casualties ; lists of certificates granted to masters and mates ; the reports of the harbour commissioners of Toronto, Belleville, Quebec, Three Rivers, North Sydney and Montreal for 1906 ; list of harbour masters ; reports of harbour masters generally ; reports of pilotage commissioners ; reports of port wardens, and list of shipping masters.

I have the honour to be, sir,

Your obedient servant,

F. GOURDEAU, Lt.-Col.,
Deputy Minister of Marine and Fisheries,

APPENDIX 1

MERCHANT SHIPPING.

The total number of vessels remaining on the register books of the Dominion on the 31st December, 1906, including old and new vessels, sailing vessels, steamers and barges, was 7,512 measuring 654,179 tons register tonnage, being an increase of 187 vessels, and a decrease of 15,646 tons register, as compared with 1905. The number of steamers on the registry books on the same date was 2,810, with a gross tonnage of 375,263 tons. Assuming the average value to be \$30 per ton, the value of the registered tonnage of Canada, on the 31st December last, would be \$19,625,370.

The number of new vessels built and registered in the Dominion of Canada during the last year was 397, measuring 21,741 tons register tonnage. Estimating the value of the new tonnage at \$45 per ton, it gives a total value of \$978,345 for new vessels.

A statement follows, showing the number of vessels and number of tons on the register books at the different ports of registry in the Dominion, on the 31st December last, along with a comparative statement of the tonnage from 1874 to 1906. A statement is also published of the number of vessels built and registered in the Dominion during the last year, and a comparative statement of the number of new vessels built and registered from 1874 to 1906, both inclusive. A comparative statement is also given of the tonnage of the Maritime States of the world.

TORONTO HARBOUR MASTERS FIFTY-SIXTH ANNUAL REPORT.

To the Commissioners of the Harbour of Toronto :

GENTLEMEN,—I have the honour to submit my report for the year 1906.

Last winter was an exceptionally mild one, so ice did not form in the harbour until January 8th, of this year. The harbour was clear of ice on April 1st, having been frozen over 82 days, or 33 days less than in 1905.

The first vessel to arrive was the s.s. *Macassa*, Captain Coonep, on March 10th, with freight and passengers from Hamilton. He got the hat. The last to arrive was the stone hooker, *H. M. Ballou*, Captain J. Johnston, on the 13th December, from Frenchman's bay. She had no cargo and was unable to proceed further than the Queen's wharf.

The number of vessels arriving this year is 3,406, or 74 more than in 1905. Below is a comparative statement of arrivals, viz.:—

	1905.	1906.	Increase.	Decrease.	Tonnage.	
					1905.	1906.
Propellers, loaded	446	457	11	..	212,553	203,878
" light	102	31	..	71		
Steamships, loaded	2364	2513	149	..	1,141,642	1,267,304
" light	2	2	..		
Sailing vessels, loaded . .	419	395	..	24	51,759	53,645
" " light	1	8	7	..		
	<u>3,332</u>	<u>3,406</u>	<u>169</u>	<u>95</u>	<u>1,405,859</u>	<u>1,524,827</u>

The year commenced with a cash balance of \$5,278.87. The receipts for the year amount to \$11,691.66, making a total of \$16,070.53. The expenses for the year were \$11,053.29, leaving a cash balance of \$5,917.24, or about \$600 more than last year's balance.

The coal receipts for the year are as follows, viz. : Anthracite coal, 105,884 tons ; bituminous coal 56,618 tons ; in all 162,502 tons or 19,651 tons less than for 1905. There was a strike in the U.S. coal mines early in the spring, delaying shipments to Canada for some time, and that loss was never quite made up.

The total quantity of coal imported into Toronto by rail and vessel, as per returns from the government at Ottawa, is as follows, viz. : Anthracite coal, 559,571 tons ; bituminous coal, 657,753 tons ; in all 1,167,324 tons, a falling off of 95,694 tons.

The highest water for the year was 22 inches above zero, on July 6th, at the Queen's wharf gauge. The lowest water was 1½ inches above zero, on the 1st December. The average for the year was 13 inches above zero, or ¾ inches above the average for 1905.

The comparatively high water and the absence of any freshet in the River Don this spring, rendered dredging in the eastern part of the harbour unnecessary. Dredging was therefore confined to the western entrance, which was dredged to the rock, giving from 14 to 16 feet of water on the range course, and a foot less in the channel. Any subsequent shallowing, that has occurred in this channel, is to be attributed to the deposit from the Bathurst street sewer.

Total quantity of material removed was 19,376 cubic yards, at a cost of \$4,753.61.

The light-houses were lighted at the Queen's wharf, for the first time in the spring, on April 1st, and were discontinued on December 14th.

The buoys were placed out on April 2nd, and taken up on November 11th.

SESSIONAL PAPER No. 23

The Queen's wharf was constructed in 1853. The upper part being a good deal out of repair, the commissioners decided to replace the wooden upper part with a more durable material, and during the summer, one hundred feet have been made of concrete at a cost of about \$2,200. It is proposed by the commissioners to continue this work, year by year, until the whole upper part of the wharf is of concrete. The cribs below low water mark were, upon examination, found to be perfectly sound.

A deputation consisting of representatives from the City Council, Board of Trade and Harbour Commissioners, proceeded to Ottawa on December 12th with the view of impressing upon the Minister of Public Works, the necessity of deepening the western channel to 18 feet, so as to allow any vessel on Lake Ontario to enter this, the most important port of refuge on the north shore, at any time and under any stress of weather. The minister promised that an expert report would be made, with a view of having this work done by the government, as the Harbour Commissioners have no means for so expensive an undertaking.

The west end of the Queen's wharf showing signs of decay, the white lighthouse was moved a few feet forwards upon solid ground, but the movement was so made that no material change was made to the range course, which is N. E. by N. $\frac{1}{2}$ N.

There are 88 vessels wintering in the harbour this year, viz.: 11 passenger steamers; 9 freight propellers; 11 schooners; 12 ferries; 7 tug boats; 8 steam launches and about 30 sailing yachts; in all, about 17,160 tons register.

Mr. J. G. Sing, C.E., the government engineer-in-charge, reports as follows, under date 31st December, viz.: 'Dredging operations have been carried on during the past season at the eastern channel, and some 70,000 cubic yards of material moved therefrom. The governing depth is now 16.6 feet. Fourteen hundred and sixty-five feet of close sheet piling has been constructed in the channel side of the east pier, commencing at the northerly end of the one thousand feet previously completed. The cribs are thus secured from danger of being undermined. The greatest depth of water will be found in mid channel.'

Mr. R. F. Stupart, Director, Meteorological Observatory, Toronto, reports as follows, viz.: 'During the season of navigation, sixteen storm warnings were displayed at the Toronto Storm Signal Stations, and in nearly every case a storm succeeded the warning issued. The two heavy gales on Lake Ontario were those which were experienced between the 27th and the 28th of October, and between the 21st and 22nd of November.'

'Although, undoubtedly, the majority of mariners heed the storm signals, there are others who seemingly, do not, and one wreck, on the lake this season, with much loss of life, can be directly attributed to the disregard of storm-signal warnings.'

'The storm-signal station at the Eastern Gap was put in operation at the opening of the season. A 70 foot mast was erected to carry the signals, which owing to their altitude and the open sky line, can be seen from a long distance in every direction. The lamps or night-signals are lighted by electricity.'

'The Queen's wharf signal station is also maintained, as it was considered to the best interests of the shipping trade that it should remain. The lanterns here, however, are not lighted by electricity, as the current has not yet been carried to the vicinity.'

'A true velocity of the wind blowing on the lake, can now be ascertained from the latest improved wind gauge,' which is installed at the Eastern Gap Fog Alarm building.'

The precipitation for the year 1906 is: Rain, 27.21 inches; snow, reduced to water, 3.77 inches; in all 30.98 inches, or .22 inches less than for 1905.

I am, gentlemen, your obedient servant,

COLIN WM. POSTLETHWAITE.

Harbour Master and Secretary.

APPENDIX 3

REPORT OF THE QUEBEC HARBOUR COMMISSIONERS FOR THE YEAR
ENDING DECEMBER 31, 1906.

(UNDER THE AUTHORITY OF THE QUEBEC HARBOUR COMMISSIONERS' ACT, 1899.)

QUEBEC, January 2, 1907.

To the Honourable
L. P. BRODEUR,
Minister of Marine and Fisheries,
Ottawa.

SIR,—In compliance with the requirements of the Quebec Harbour Commissioners' Act, 1899, I have the honour to report as follows on the doings of the Quebec Harbour Commissioners for the year 1906.

CHIEF ENGINEER'S REPORT.

The annexed report (marked 'A'), from the Chief Engineer, Mr. St. Geo. Boswell, conveys information in regard to all matters coming under his care in connection with the commissioners' properties, the various additions and repairs made to them, and the work of securing the dock wall under contract with Messrs. M. P. & J. T. Davis.

WHARFINGER'S REPORT.

The annexed report (marked 'B'), from the wharfinger, Mr. P. Flynn, gives the usual information regarding the traffic of the Louise docks during the year 1906.

HARBOUR MASTER'S REPORT.

The annexed report (marked 'C'), from the harbour master, Mr. J. C. Sullivan gives information in regard to the opening and closing of navigation in the harbour, formation of ice, &c.

PREMISES LEASED.

Renewals for one year of premises leased have been given to Messrs. E. M. Lennon & Co., Whitehead & Turner, Canadian Import Co., Madden & Son, Julien Lapointe, Jos. Gingras, T. Davidson & Co., A. R. Pruneau & Co., and J. S. Thom

Reynar's wharf, formerly occupied by the Quebec Coal Co., has been leased to the Department of Marine and Fisheries, and Store No. 11 and yard in the rear to Mr. J. B. E. Letellier, wholesale grocer.

REPAIRS TO PROPERTY.

Careful attention has been paid to the various properties of the commissioners, to maintain and bring them up to a first class condition.

Details will be found in the chief engineer's report.

SALOONS NEAR DOCKS.

The commissioners are pleased to note that the license commissioners have taken action on their recommendation and have refused to grant licenses to saloons in close

proximity to the docks, thus taking a temptation out of the way of the sailors and the thousands of immigrants who are arriving there during the season of navigation.

SECURING DOCK WALLS.

The work of securing the dock walls, necessitated by the accident in 1905, the contract of which was awarded to Messrs. M. P. & J. T. Davis, has been progressing favourably, the work in the inner basin being nearly completed. A supplementary contract, involving a further expenditure of about \$200,000, for the balance of the work in the outer or tidal harbour, has been awarded to Messrs. M. P. & J. T. Davis, and it is hoped that the whole work of securing the dock wall will be completed early in 1908. This work not only will secure these walls, but give the increased depth of water, now so much required.

SECURING CROSS WALL.

This work which has to be done by day work and carried on during the winter months, was commenced in January, 1906, and considerable progress made. Work will go on during the winter of 1907, and it is expected it will be completed in 1908. The cost will be about \$50,000.

GRAVING DOCK ACCOMMODATION.

The commissioners being impressed by the necessity of increased graving dock accommodation at Quebec, to meet the needs of the St. Lawrence trade, on the 6th of September passed the following resolution, which was forwarded to the honourable the Minister of Public Works, and the members of the Dominion government.

Resolved:—That the Quebec Harbour Commissioners respectfully bring to the attention of the honourable the Minister of Public Works, the inadequacy of the Graving Dock accommodation in the Harbour of Quebec to meet the requirements of the St. Lawrence trade.

That the graving dock at Lévis, with an entrance of 62 feet, does not permit steamers of recent construction which are now performing this service, to dock.

The following steamers are on the St. Lawrence service :

<i>Empress of Britain</i> ...	65 feet beam.
<i>Empress of Ireland</i>	65 " "
<i>Victorian</i>	60 " "
<i>Virginian</i>	65 " "

Other steamers now performing service between England and the North American ports are 75 feet and upwards. The new Cunard steamers now under construction are 88 feet. H. M. S. *Dominion* recently in our port, and which required to dock, had a beam of about 80 feet. None of the above-named steamers could enter the Lévis graving dock for repairs.

It is therefore most urgent, that suitable docking accommodation should be provided at as early a date as possible.

The Quebec Harbour Commissioners would respectfully point out that, in event of any accident to those steamers the situation would be serious, and this may, to some extent be the cause of the continued high rates charged by the insurance companies, as permanent repairs could not be made anywhere in the St. Lawrence.

The Quebec Harbour Commissioners would therefore respectfully but urgently press upon the honourable the Minister of Public Works, the necessity of the immediate construction of a graving dock, in the Harbour of Quebec, and as the dock, if commenced at once, could not be available for steamships sooner than 1910, and as it will be national in

SESSIONAL PAPER No. 23

its character, serving the whole shipping trade of the Dominion of Canada, it should have an entrance of 100 feet, which would be able to give the necessary accommodation to the steamers now and in the future frequenting the St. Lawrence.

The commissioners would further respectfully submit to the honourable the minister, the dimensions of three of the principal European graving docks, viz.:—

Canada graving docks, Liverpool, length 925 feet, width 94 feet.

Southampton graving docks, Liverpool, length 860 feet, width 90 feet.

Bremenhaven graving dock, Germany, length 741 feet, width 92 feet.

HARBOUR IMPROVEMENTS.

In view of the constant and increasing demands for better accommodation in the Harbour of Quebec, the commissioners, by a memorial of date, November 19th, addressed to the Right Honourable the Premier, made the following recommendations:—

1st. That the river face of Pier No. 1, is now being utilized by the Canadian Pacific Railway Co., for the berthing of their Empress steamers, and has proved to be of the greatest possible service not only to the Harbour of Quebec; but the commissioners venture to think to the whole Dominion, as owing to the existence of this pier these large vessels have been afforded a suitable berth, and the Canadian Pacific Railway Company have been able to divert a large amount of traffic to the St. Lawrence route. They are already complaining of lack of accommodation which the completion of Pier No. 1, will meet when both sides of the pier are available in place of only one as at present.

The commissioners understand that other steamship companies intend placing large passenger and cargo boats on the St. Lawrence route.

These vessels will require accommodation of the same kind as that now provided for the Empress boats. In view of this fact, the commissioners consider that Pier No. 1, as shown on plan 323, should be completed at the earliest date, so that, when the Canadian Northern and other railways now under construction reach Quebec, the harbour accommodation required for the steamship connections will be in readiness.

2nd. The construction of a cribwork retaining wall along the south side of the river St. Charles from the Quebec and Lake St. John Railway Company's cribwork to Flood's wharf, as shown in the submitted plan R 322, between the points K and M, and to fill in the contained area, the whole for the purpose of giving the railway companies better access to the Louise docks.

3rd. To widen the breakwater on the inside face, as shown on plan R. 323.

This would provide a deep water berth on the inside face of this pier, and would furnish much needed additional quay surface.

LEGAL ADVISER TO COMMISSIONERS.

At the meeting of the commissioners held on the 5th of March, Mr. C. Edouard Dorion, K. C., was appointed joint legal adviser, with Mr. J. A. Lane, advocate, the appointment dating from the 1st of March.

EXPENDITURE ON CAPITAL ACCOUNT.

The expenditure on Capital Account during the year has been \$180,851.23.

Particulars of this expenditure will be found in a statement accompanying this report.

Under the provisions of 62-63 Vic., chap. 34, section 4, the commissioners have received on account of capital account from the Dominion government, \$156,859.71.

6-7 EDWARD VII., A. 1907

REVENUE AND EXPENDITURE.

The revenue of the commissioners for the year 1906 has been \$100,899.62, an increase of \$8,269.37 over that of 1905, and the expenditure \$83,502.57, leaving a surplus of \$17,397.05 over the working expenses and interest on \$50,000 of First Preference Bonds.

ICE CUTTING.

During the winter of 1905-1906, 80,737 blocks of ice have been cut for local use.

Care has been taken that all the ice cut for domestic purposes is perfectly pure, and taken from localities in the harbour that had been selected after an analysis of the ice had been made.

To this report are annexed the various statements conveying the information yearly forwarded to your department, in connection with the harbour, as also a complete statement of the commissioners' accounts for the year.

I have the honour to be, sir,

Your most obedient servant,

JAS. WOODS,

Secretary-Treasurer.

SESSIONAL PAPER No. 23

A

HARBOUR ENGINEER'S OFFICE.

QUEBEC, 2nd January, 1907.

JAMES WOODS, Esq.,
 Secretary-Treasurer,
 Harbour Commission.

SIR,—I have the honor to submit, herewith, the following, with reference to the various works in connection with the maintenance and improvement of the Harbour of Quebec, executed by this department during the year 1906.

CONTRACT WORK.

Messrs. M. P. & J. T. Davis, the contractors for the construction of a new quay front to the Louise Embankment in the wet dock, and for 322 feet of new frontage in the tidal harbour, have made satisfactory progress with this work.

The substructure for the wet dock frontage has been completed, with the exception of 141 feet; the cribwork structure block for this length has been completed, and will be put in place early next spring. The superstructure in the wet dock, has been completed for a length of 900 feet, and the back filling has been brought up to the same point. One of the substructure cribwork blocks for the tidal harbour frontage, is now complete, ready for sinking, and the second one has been built up to a height of 12 feet.

CROSS WALL STRENGTHENING

The work of placing tie rods in the cross wall was begun in January last, and 14 rods were put in place; in addition to this 61 two inch holes have been drilled through the masonry walls ready for the placing of rods during the present winter; this work had to be discontinued in April, so as to permit of the surface of the cross wall being restored to its original condition, and made ready for the season's business.

GENERAL WORK.

The commissioners' dredge was employed during the early part of the past summer, by the contractors for the new quay front, for the purpose of preparing the foundations for the wet dock cribwork blocks; and was also employed by the Great Northern Elevator Company, for removing silt which had accumulated over and blocked the suction pipe furnishing water to the elevator engine.

The Nova Scotia Steel & Coal Co., moved their discharging plant out to the new dock face, in the latter part of June, and berthed the first vessel at it on the 9th of July.

To make connection with the Canadian Pacific Railway's lines to the north of gas works, a new railway track has been laid down for a length of some 500 feet, from the embankment main line to the boundary of the commissioners' property at Ramsay street.

Owing to the number of ballast trains brought down over the commissioners' tracks, for the purpose of furnishing material for the breakwater extension, and to the increase in the number of passenger and freight trains, due to the berthing of Empress boats at the breakwater, the traffic on the main line has been somewhat congested, and will soon have to be relieved by the construction of an additional railway line; this, however, cannot be done, until the wing of the Terminal Company's brick building has been removed.

6-7 EDWARD VII., A. 1907

A part of the site formerly leased to the Great Northern Railway Co., has been leased as a coal yard to the Quebec Coal Co. The weigh house has been removed from Reynar's and installed near this site for the use of the Quebec Coal Co., and other dealers having coal on the Embankment.

The northern section of the old immigration buildings on the breakwater, has been taken down, a landing shed for the reception of passenger's baggage, erected in its place, and four additional arc lamps have been installed, in connection with the landing shed, at this berth.

An office has been placed in Shed No. 18, in substitution for the one in the demolished section of the old immigration buildings.

The part of the Embankment, north of the roadway, has been divided up into numbered sections in order to facilitate the location, and storing of lumber, &c.

As vessels berthed at the breakwater extension obscured the red range light at high tide, this light shall be temporarily increased in height.

A metallic tower of the required height, is now being constructed by the Department of Marine and Fisheries, to take the place of the present temporary arrangement.

To reduce the insurance premiums of the various buildings of the commission, brick chimneys have been placed in all the offices connected with the sheds and stores.

The sheds Nos. 13, 14, 18 and 22 have been painted, and roadways and railway tracks, generally, kept in a good state of repair.

The building store No. 11, situated on Dalhousie street, has been fitted up as a wholesale grocery establishment, to meet the requirements of Messrs. J. B. E. Letellier, to whom it has been leased.

To form a berth for the ss. *Savoy* at the southern face of Atkinson's wharf, a portion of the pond between this and Marmette's wharf has been dredged out, and the face of the wharf put in a state of repair.

A part of the store No. 5, on the East India wharf, has been taken down, as it was in a dangerous condition, and the additional wharf surface thus made available, has been planked over and put in a condition to receive cargoes of coal.

The roof of shed No. 1, has been sheathed with galvanized iron, and the building No. 8, painted, minor repairs have been made to the other wharfs and buildings belonging to the commission.

The entrance gates to wet dock were not opened for the morning tide on September 12, the tide not having risen sufficiently for the purpose.

The Cross Wall draw bridge was operated for the first time the past season on the 16th of April, and for the last time on December the 6th.

The water was retained in the wet dock for the first time on May 7; and the last time on December 3, on which date the gates were allowed to remain open, and were secured for the winter.

I have the honour to be, sir,

Your obedient servant.

ST. GEO. BOSWELL,
Chief Engineer.

B

QUEBEC HARBOUR COMMISSIONERS' OFFICE.

QUEBEC, January 2, 1907.

JAMES WOODS, ESQ.,
Secretary-Treasurer,
Quebec Harbour Commissioners.

SIR,—I have the honour to submit the following with reference to the traffic of the St. Charles docks and wharfs, showing the number of vessels, their registered tonnage, amount and description of cargo landed and shipped from those docks during the season of 1906 :

SESSIONAL PAPER No. 23

Inwards 294 vessels, 1,168,310 tons register.

23,654 tons general cargo.
 3,714 " cement.
 11,976 " salt.
 7,517 " grain.
 2,575 " molasses.
 1,026 " earthenware.
 1,213 " bricks.
 3,259 " railroad iron.
 114,458 " coal.

Outwards 95 vessels 308,233 tons register.

13,466 tons general cargo.
 16,186 " pulp and paper.
 4,405 " grain
 862 head of cattle.
 2,125 tons of asbestos.
 18,521 P. S. of lumber.
 15,523,340 feet B. M. timber.

ANTHRACITE COAL TRAFFIC.

101 barges landed 26,112 tons coal.

LOWER PORT STEAMERS.

41 vessels 9,749 tons register.

Landed 419 tons general cargo.
 Shipped 1,961 tons general cargo.

VESSELS IN DISTRESS USING THE DOCKS.

SS. *Coronel* touched bottom at Belle Isle, came into basin to be surveyed was found to be all right and proceeded to Three Rivers to load.

SS. *Cervona* grounded at Anticosti, came back to Louise Basin to be surveyed, having been found seaworthy, proceeded on her voyage.

SS. *Athenia* grounded at Cap à la Roche on her way down from Montreal, came into Louise Basin to be surveyed, found to be all right and proceeded to sea.

SS. *Polino* grounded at Goose Island; after having been floated came up to the Louise Basin; after having landed the balance of her coal went to the dry dock to be repaired, and then came back to the Louise docks to winter.

SS. *Kensington* grounded at Matane; after having been floated up to breakwater, where she discharged a part of her cargo; being surveyed proceeded to Montreal to land the balance of her cargo, came back and went into graving dock; after being repaired came into the Louise dock, loaded cargo and proceeded to sea.

During the past season the different ocean mail steamers landed 112,000 passengers at the immigration station, Louise docks, who were forwarded to their future homes by the different railway companies.

No record has been kept of cabin passengers.

There are wintering in the Louise docks 25,000 Q. S. of lumber, besides coal, railway ties, &c., &c.

During the year, spaces were rented at low rates for storage of coal landed and removed from the water front.

The surface traffic has required the employment of 8,219 cars, being an increase of 1,648 cars over last year.

6-7 EDWARD VII., A. 1907

There are stored in the different freight sheds, salt, cement, &c., &c., which the owners are obliged to remove before the opening of navigation, viz.:

1,878 tons cement.
 750 " coal.
 718 " salt.
 414 squares lumber.
 350 tons hay.

The Dominion Coal Company have 13,000 tons coal stored on space rented to them, and the Nova Scotia Coal and Steel Company 4,000 tons coal on their space.

The docks are occupied during the winter by a large number of vessels of various tonnage, where they find safe quarters until the opening of navigation.

I have the honour to be, sir,

Your most obedient servant,

P. FLYNN,
Wharfinger.

NOTE.—The partial filling of the breakwater extension by the Canadian Pacific Railway Company has required 4,453 carloads of filling material, aggregating 100,074 cubic yards.

The above cars are additional to the 8,219 cars used for surface traffic on the docks.

C.

QUEBEC HARBOUR COMMISSIONER'S OFFICE,
 QUEBEC, January 2, 1907.

JAMES WOODS, Esq.,
 Secretary-Treasurer, Quebec Harbour Commissioners,
 Quebec.

SIR,—I have the honour to submit the following with reference to the harbour, for the year 1906.

Navigation was open in the harbour all winter.

Tugs were working in the Louise dock up to December 7.

Bat. schooner, *Caron* arrived from Lower St. Lawrence under sail on April 4.

Government ss. *Druid* left Louise basin on April 6.

Bat. schooner *Caron*, for Lower St. Lawrence, under sail with general cargo, on April 13.

Schooners *Marie Elmira* and *Florida*, first schooners from Lower St. Lawrence, arrived in the harbour on April 14.

SS. *Savoy*, first outward steamer with passengers and freight, left the harbour on April 16 for Lower St. Lawrence.

The ice bridge connecting the Island of Orleans with the north shore broke up on April 17.

The ice in the wet dock and tidal basin broke up on April 17.

Anticosti lightship No. 15 left for tidal basin on April 18.

SS. *Campana* and SS. *Polino* left for Montreal on April 19.

SS. *King Edward* left the harbour with passengers and freight for Lower St. Lawrence on April 20.

First Richelieu and Ontario Navigation Company, *Chicoutimi* left for the Lower St. Lawrence on April 23.

SS. *Scottish Hero*, first steamer from sea with coal cargo, arrived in the harbour on April 24.

All pontoons were placed in the harbour on April 23.

SESSIONAL PAPER No. 23

Lake and Cap Rouge ice passed down on April 16 and 17.

Government mail tender left for Lower St. Lawrence on April 23.

First passenger boat of the Richelieu and Ontario Navigation Company from Montreal, *St. Irénée* arrived in the harbour on April 24, and made her return trip the next evening.

The first Royal Mail and passenger steamer, *Parisian* arrived in the harbour on April 30.

During the month of August the French warships *Le Desaix* and the *Jurien de la Gravière*, H.M.S. *Dominion*, and the German gunboat *Panther* arrived and anchored in the harbour.

No ballast was discharged in the harbour during the past season.

In addition to the routine work of the harbour and the office, four hundred and thirty-one (431) ocean sea-going vessels have been berthed in the Louise docks, break-water and Point Carcy wharfs.

The limits of the clear water space (forbidden anchorage) are indicated at night by red lights, and in day time by sign boards on both sides of the river.

The last ocean Royal Mail steamer *Empress of Britain* (Canadian Pacific Railway Co.), left the harbour with passengers and mails, on November 16.

The Richelieu and Ontario Navigation Co. steamer, *Tadoussac* made her last trip from the Saguenay on November 27.

SS. *Murray Bay* of the Ontario and Richelieu Navigation Co., made her last trip from Quebec to Montreal on November 27.

SS. *Deramore*, last freight steamer, left the harbour on November 30.

The last passenger and freight steamer, ss. *Kensington* left the Louise Basin on December 2.

SS. *Restigouche* arrived from Lower St. Lawrence and went into winter quarters on December 2.

The last freight steamer ss. *Deramore* left Port Malbaie on December 2.

The ice in the wet dock formed on December 5.

The ice in the tidal basin formed on December 7.

The ice in the St. Charles formed on December 11.

The ice bridge connecting the Island of Orleans and the north shore formed on December 11.

Notices have been posted in suitable localities, warning parties from discharging rubbish of any kind in the river, and every precaution is being taken to prevent any violation of the regulations of the commissioners in that respect.

I have the honour to be, sir,

Your obedient servant,

JAS. G. SULLIVAN,

Harbour Master.

6-7 EDWARD VII., A. 1907

HARBOUR COMMISSIONERS' OFFICE,
QUEBEC, February 9, 1907.To the Chairman and Commissioners,
Quebec Harbour Commission,
Quebec.

GENTLEMEN,—We have the honour to inform you that we have examined the books and vouchers of the commission for the year ending 1906, and beg to report that we found same correct and in good order.

Mr. Woods, the secretary-treasurer, gave us all facilities in making the audit.

We have the honour to be, gentlemen,

Your obedient servants,

A. J. MESSERVEY,
J. B. LEBRUN,
Auditors.

SESSIONAL PAPER No. 23

APPENDIX 4

REPORT OF THE HARBOUR COMMISSIONERS OF THREE RIVERS FOR
THE YEAR ENDING DECEMBER 31, 1906.

THREE RIVERS, P. Q., June, 15.

To F. Goudreau, Esq.,
Deputy Minister of Marine and Fisheries,
Ottawa.

SIR.—I have the honour, by the direction of the Harbour Commissioners of Three Rivers, to forward herewith, for the information of the Honourable the Minister of Marine, statements of receipts and disbursements of the commission for the year ended 30th December, 1906. Also a synopsis of the operation and a comparative statement of navigation of the port during the same year.

Yours respectfully,

GEORGE BALCER, *Secretary.*

THREE RIVERS HARBOUR COMMISSIONERS, REPORT FOR THE YEAR 1906.

COMMISSIONERS :

P. A. Drolet, Esq., Chairman.

Henry E. Hart, Esq.
P. A. Gouin, Esq.Jos. L. Fortin, Esq.
F. S. Tourigny, Esq.

Geo. Balcer, Secretary.

Disappointed again by the unfortunate delay in the construction of the new harbour works, the season of navigation 1906, not more than its predecessor, could meet—as far as ocean traffic is concerned—the expectation we so confidently relied upon. Not that the volume and value of our transactions suffered any reduction, by no means; they are steadily on the increase; but on account of the persistent lack of proper accommodation and reduced wharf-space, none of our contemplated projects could yet be introduced, and the products of our field and farms, our industrial establishments continued keeping shy of our port. Even part of the lumber of our Three Rivers mills for export by sea and most of the raw-material and coal for our manufactures had again to resort to round-about means to reach their destination.

The results of such a situation are easily foretold: they cannot, at length, avoid being disastrous. And so it came that no more than 49 steamers entered our port in 1906, the lowest figure for many years, against an average of 80 for the last decade and a hundred and over, two and three years ago.

No doubt the decrease, of late, in the export of lumber to the English market, continued a leading factor in the decline of our shipping; for 26 steamships only, carrying but 21,500,000 feet lumber, against 47 and 31,000,000 feet in 1905, and a far larger proportion in former years, registered last season and completed, with but one single cargo of cattle, our direct export by sea.

Our imports did not fare better. Coal did not come up to the quantity expected, as the Dominion Coal Co's. temporary wharf-space does not allow bringing in the full

6-7 EDWARD VII., A. 1907

supply. Other companies were simply forced to keep out altogether. Consequently, but 55,000 tons of coal, 8,500 tons of sulphur, 2,240 tons pig iron and a few smaller parcels, made up the list of direct imports in 1906.

If our ocean traffic showed such a serious falling off, the traffic by water between our port and the United States firmly held its own. Although canal boats show a reduction in number, the introduction of steam barges of greater capacity largely compensates the difference:—the tonnage in 1905 was 84,000, the highest on record, while in 1906 it figured over 96,000 tons.

The quantity of lumber carried by boat, which reached, in 1905, the already respectable figure of 23 million feet, exceeded, in 1906, by 50 per cent our total export to Great Britain, and by over 45 per cent the last export to the States; *i.e.* more than 33 million feet. Consequently, making up with the shipments by rail—not only a full average—but exceeding any quantity of lumber ever shipped by our firms to both the English and the United States markets; *viz.*, from 50 to 60 million feet.

Pulpwood by boat from Three Rivers came up to 55,000 cords; with the quantities shipped from the surrounding mills and by rail, the total exports exceed by a good deal the shipment of former years. The same with other exports: for according to consular reports, the total value of our direct export to the United States reached in 1906 \$1,500,000, the highest amount ever attained.

The temporary shrinkage in our marine operations, due to peculiar local circumstances, fortunately does not affect, as already mentioned, the regular development of the trade, nor the healthy condition of our economic situation. The output of our mines and manufactures, the products of our forests and mines, the demand for machinery, raw material, &c., are constantly progressing. We need only glance at the returns of our customs. The revenue collected at Three Rivers in 1906 was \$126,709, an increase of \$44,600 over 1905. Compared with the revenue of 1896, which amounted exactly to \$26,600, we can easily draw a conclusion.

A further redeeming feature to the disappointment of the moment is the fact, that early in November, the concrete walls of the new wharf were all completed, leaving merely part of the filling-in of the ground in rear and the laying of side tracks to hand over for traffic an additional 2,000 feet frontage with a depth of 30 feet and nearly 500,000 feet top wharf; *i.e.* four berths for the largest steamers and space for handling any amount of freight or storage.

On December 31, the railway between Three Rivers and Shawinigan Falls was inaugurated.

Thus two long desired wants have, at last, been satisfied.

THREE RIVERS, March 12, 1907.

GEORGE BALZER,
Secretary.

APPENDIX 6

REPORT OF THE HARBOUR COMMISSIONERS OF NORTH SYDNEY FOR
THE YEAR ENDED DECEMBER 31, 1906.

NORTH SYDNEY, N. S., April 29, 1906.

COL. F. GOURDEAU,
Deputy Minister of Marine and Fisheries,
Ottawa,

SIR,—The Harbour Commissioners beg to hand you herewith a statement of receipts and expenditures for the year ending December 31, 1906. Also, please find inclosed, a report of the number of vessels that arrived during the year, at the Sydneys, and the coal shipments and importations of ore, &c., at the several piers in Sydney and North Sydney.

Navigation was practically open to North Sydney during the whole year. Nothing prevented steamers arriving and sailing.

Your obedient servant,

WM. HACKETT,
Secretary.

Coal shipments, 1096 :	Tons.
Dominion Coal Co., Ltd, International Pier, Sydney	1,500,000
Nova Scotia Steel and Coal Co., Ltd	429,288
Iron ore importations, 1906 :	
Dominion Iron and Steel Co., Ltd., Sydney	518,516

APPENDIX 7

REPORT OF THE HARBOUR COMMISSIONERS OF BELLEVILLE FOR THE
YEAR ENDING DECEMBER 31, 1906.

BELLEVILLE, ONT., Dec. 31, 1906.

F. GOURDEAU, Esq.,
Deputy Minister of Marine and Fisheries,
Ottawa.

SIR,—The undersigned Harbour Master of the city of Belleville begs to submit the following report for the year 1906.

Navigation opened in Belleville Harbour on 16th day of April and closed on the 2nd day of December.

Import dues on	147 tons stone\$	7 35
"	1,327½ tons mds	132 67
"	12,344 tons coal	1,234 40
"	1,334,000 ft. lumber	66 77
"	822,000 laths	20 01
"	94,000 shingles	2 82
"	1,265 cedar posts	1 58
"	1¼ tons cheese	0 12
"	278 tons clay	16 68
"	35 yds. gravel	1 75
			<hr/>
			1,484 15
Expense for wood buoys, postage, &c	\$	8 68
Export dues on	18,000 brick\$	0 90
"	25 telegraph posts	0 25
"	1,166½ tons mds	116 64
"	93,171 saw logs, &c	385 37
"	596½ tons cheese	59 65
"	15,461 bush grain	19 11
"	45,000 shingles	1 35
			<hr/>
			583 27
Dues collected during the season are as follows :			
Total amount derived from imports	\$	1,484 15
" " exports		584 27
			<hr/>
Total	\$	2,067 42

The amount of dues on imports has decreased ; the coal is 3,641 tons, and export dues, brick by 127,000. Cheese has also fallen off

All of which is respectfully submitted.

I have the honour to be, sir,

Your obedient servant,

SYD. VANDERVOORT,
Harbour Master.

SESSIONAL PAPER No. 23

APPENDIX 8

REPORT OF THE PILOTAGE AUTHORITY OF QUEBEC FOR THE YEAR
ENDING DECEMBER 31, 1906.

QUEBEC, July 15, 1907.

F. GOURDEAU, Esq.,
Deputy Minister of Marine and Fisheries,
Ottawa.

SIR,—I have the honour to inclose you a report of the Quebec Corporation of Pilots from July 20, 1905, to January 1, 1907.

Charles F. Brown,	admitted Sept. 21, 1852,	Pensioned April 1, 1906,
Paul Pâquet,	" June 14, 1853,	" Aug. 17, 1905,
George Normand,	" July 4, 1854	" Aug. 16, 1905,
Numa Lachance,	" April 10 1855,	" May 1, 1906,
Cyprien Langlois,	" Oct. 24 1865,	" July 10, 1906,
Ephrem Chamberland,	" May 28 1869,	" Jan. 1, 1906,
D. Arthur Bouffard,	" April 7 1877,	" Oct. 24, 1906,
Nazaire Delisle,	" Nov. 7 1877,	" March 2, 1906,

Mr. Charles Pelletier, pilot on duty on board the bark *Magda* lost his life with all the crew in the storm of last November 16, 1906.

On March 20, 1906, and following days, all the pilots were examined on charts and compass, before Commander O. G. V. Spain. Every one went through satisfactorily, except three who failed, two of these, Messrs. Laurent Godbout and J. B. Tremblay, were declared physically unable to fulfil their duties.

During the season 1906, two pilots, Messrs. Adélarde Vézina and William Dorion, had their license cancelled for life, for misconduct.

Mr. Edmond Larochelle, jun., was appointed superintendent of Quebec Pilots on May 1st, 1906.

ALFRED LAROCHELLE,
Superintendent of Quebec Pilots

QUEBEC, July 15, 1907.

SESSIONAL PAPER No. 23

APPENDIX 15

REPORT OF PILOTAGE AUTHORITY OF SYDNEY, C.B., YEAR ENDING
DECEMBER 31, 1906.

F. GOURDEAU, Esq.,
Deputy Minister of Marine and Fisheries,
Ottawa, Canada.

SIR,—Herewith please find returns in connection with pilotage authority, district
of Sydney, year ending December 31, 1906.

I am, sir,
Your obedient servant,

W. A. RICHARDSON, *Secretary.*

STATEMENT OF RELIEF.

6-7 EDWARD VII., A. 1907

The following is a statement of the earnings which have been paid to the pilots so employed for the year of 1906, in the port of Pugwash :—

Pilotage dues on ships....	\$ 833 90	
Extra mooring and moving.....	30 00	To loading berth.
Piloting schooners.....	25 00	George Heather.
For schooners.....	6 50	Andrew L. Seaman.
" "	10 25	Alfred E. Seaman.
" "	10 00	Neil McHiver.
" "	6 00	George Tuttle King.
Pilotage dues total.....	\$ 921 65	

A number of schooners enter this port that pilot themselves inward and outward. There is no pilot fund in the district. The inclosed report is most respectfully submitted.

I am, sir, your most humble servant,

ELIAS KING,

Secretary of Commissioners of Pilots.

APPENDIX 20

REPORT OF THE PILOTAGE AUTHORITY OF BUCTOUCHE, N. B., FOR THE YEAR 1906.

BUCTOUCHE, N. B., January 29, 1907.

F. GOURDEAU, Esq.,
Deputy Minister Marine and Fisheries,
Ottawa.

DEAR SIR,—I herewith inclose pilotage returns for the pilotage district of Buctouche, for the year 1906, which I hope will be found satisfactory.

Yours very truly,

JOHN C. ROSS, *Secretary,*
Buctouche Pilotage Authority.

PILOTAGE Returns, district of Buctouche, province of New Brunswick, for the year 1906.
Act 36 Vic. cap. 54 sec. 24.

1. Names and ages of pilots licensed :—Joseph Crossman, age 55 years ; Joseph Belleisle, age 50 years.

2. The above pilots are licensed to undertake the pilotage of vessels of every description within and throughout the pilotage district of Buctouche.

3. Pilotage dues are charged as per section 1 of rules and regulations for the district, viz. : One dollar and fifty cents per foot draught of water both inward and outward bound.

4. Total amount of pilotage dues collected during the year \$210.25 ; of this amount \$206.25 was paid by 4 sailing vessels and 2 steam barges, all foreign ; and \$4 by 2 schooners British (optional).

5. The pilotage as above, was paid to the pilots who performed their duties as such to the respective vessels.

6. No new licenses were issued during the year, nor any expenses incurred by the pilotage authority.

JOHN C. ROSS,
Secretary Pilotage Authority.

BUCTOUCHE, N. B., January 17, 1907.

APPENDIX 21

REPORT OF THE PILOTAGE AUTHORITY OF NEW WESTMINSTER, B. C.,
FOR THE YEAR ENDING DECEMBER 31, 1907.

NEW WESTMINSTER, B. C., March 1, 1907.

F. GOURDEAU, Esq.
Deputy Minister of Marine,
Ottawa.

The pilotage authority of the port of New Westminster, B. C., beg leave to submit the following report for the year 1906.

Name of pilot:—James W. Rogers, age 40. Serving full district.

No. of vessels reported liable to pay pilotage.—

British sailing vessels	2	3
" steam "	5	4
Foreign " "	11	11
" sailing "	4	4
	22	22

One steam and one sailing vessel in port.

Nationality of above vessels reported inwards during 1906:—

British.	7
American.	10
Norwegian.	2
German.	1
Japanese.	1
	22

The total amount received for pilotage services for the year, as follows —

From British vessels	\$ 422 25
" Foreign "	742 40
	\$1,164 65

The above amount was duly paid the pilot, less 10 per cent.

The rates of pilotage for the district are as follows:—

For vessels under sail.	\$4 00 per foot.
" " " steam.	1 50 " "
" " in tow of a steamer.	2 00 " "

Respectfully submitted,

F. P. MAXWELL,
Secretary.

APPENDIX 22

REPORT OF THE PILOTAGE AUTHORITY OF RICHIBUCTO, N. B., FOR
THE YEAR ENDING DECEMBER 31, 1906.

REXTON, N. B., November 30, 1906.

F. GOURDEAU, Esq.,
Deputy Minister of Marine and Fisheries,
Ottawa.

SIR,—We, the pilot commissioners for the port of Richibucto, N. B., send you our annual report.

We held annual meeting in William J. Brait's office, Rexton, March 24. William H. Long, George H. Long, John A. Curwen, James W. Long, Albert A. Long. Five pilots were granted licenses for this port and posted in Custom House, Richibucto, N.B., on May 1, 1906.

Sorry we have to report loss of Norwegian bark *Adeoná*, while loading outside of bar, being driven on reef with northeast gale, and eleven persons on board perished November 13, 1906.

Depth of water on jib sheet bar 12 ft. 6 in. H. W. O. S.

Depth of water on outer bar 13 ft. 6 in. H. W. O. S.

JAMES GORDON,

Secretary to Pilot Commissioners.

Richibucto, N. B., December 13, 1906.

Ten vessels, 3,051 tonnage, loaded and cleared foreign.

150 schooners, 12,000 tonnage, loaded home trade and U. S. A.

APPENDIX 24

REPORT OF THE PILOTAGE DISTRICT OF MONTREAL FOR THE
YEAR ENDING DECEMBER 31, 1906.THE PILOTAGE OFFICE AT MONTREAL,
December 7, 1906.COL. F. GOURDEAU,
Deputy Minister of Marine and Fisheries,
Ottawa, Ont.

SIR,—Inclosed find the annual report of the working of this office during the present year.

Trusting that it will be found in order.

I have the honour to remain, sir,

Your obedient servant,

JAMES J. RILEY,
*Superintendent of Pilots.*THE PILOTAGE OFFICE AT MONTREAL,
December 7, 1906.To the Deputy Minister of Marine and Fisheries,
Ottawa, Canada.

REPORT ON MONTREAL PILOTAGE.

SIR,—I have the honour to report upon the operations of the Montreal pilotage Branch of your department for the year 1906.

The offices in Montreal are at No 1, Place Royale; Captain James J. Riley is the Superintendent, Mr. J. O. Michaud, the assistant, and Mr. Louis Pinoteau, the messenger.

The office in Quebec is on Dalhousie street, in a satisfactory location, opposite the office of the Quebec Pilots and the Boatman's landing; Mr. Ulric Thibaudeau is the officer in charge.

At the close of last season, there were forty-nine (49) branch pilots on the active service roll, and with the promotion of apprentice pilot, Mr. J. Oswald Frenette, the season of 1906 was opened with the full number of fifty (50) branch pilots in active service.

The retirement, in June, of branch pilot, Mr. Alfred St. Amant, by reason of physical disability, left a vacancy, that was filled by Mr. C. B. Hamelin.

The retirement, in November, of branch pilot, Mr. Néré Bellisle, on account of defective eye-sight, left a vacancy that was filled by Mr. Tancrede Perron, so that there are now the full number of fifty (50) branch pilots on the active service roll.

The earnings of the branch pilots amounted to seventy four thousand five hundred and fourty-four dollars and forty-nine cents (\$74,544.49), (See appendix I), which shows the names of the pilots, their ages, place of residence, date of branch, number of Montreal trips, number of trips to intermediate ports, total number of trips, earnings on Montreal trips, earnings on intermediate port trips, total of earnings and how employed, that is to say, whether special service or 'tour-de-rôle.'

SESSIONAL PAPER No. 23

The largest amount earned by any one pilot was two thousand, seven hundred and ninety-nine dollars and nineteen cents (\$2,799.19), and the smallest, one hundred and sixty-seven dollars and nine cents (\$167.09).

All the pilots were employed in special service, with the exception of thirteen (13) who were on 'tour-de-rôle' and who earned, between them, the sum of five thousand, one hundred and ninety-nine dollars and sixty-six cents (\$5,199.66).

The standard of conduct and efficiency of the pilots, as a whole, has been well maintained during the season now closed; all the special service appointments, with one exception, seem to give satisfaction, and even the exceptional case was not made a matter of special complaint.

Three cases of ebriety have been reported, one of them, a special service pilot, who has happily now been reinstated.

Appendix 2 shows the names of the ten selected apprentice pilots, and a summary of their season's work.

Two from this list have been promoted to branch pilots, as indicated on appendix 1, and those from the general list of apprentice pilots who have been promoted to the list of the ten selected are indicated on this list by 2.

May I be permitted to recommend a slight change in the by-laws, to the effect that apprentice pilots shall, during the period of their apprenticeship, serve 24 months at sea, to the end that they become conversant with the usages of seafarers, the language of the seamen whom, for the most part, they shall be called upon to assist, and obtain, in some degree, a sense of order and discipline.

Appendix 3 is a list of the apprentice pilots in the order of their seniority, all of whom are eligible for promotion to the list of the ten selected.

Appendix 4 shows the names of the persons receiving pensions from the pilots superannuation fund, and the amounts they receive each quarter. There have been four additions to this list during the year 1906. The accounts and the moneys of the pilots superannuation fund are in the custody, and under the management, of the Finance Department in Ottawa. This office only serves as a disbursing agency, and renders to the Finance Department an accounting, quarterly, of all moneys received.

The recent visit of Mr. C. W. White, from the Accounting Department, was productive of good, and the pilots superannuation fund will receive permanent benefit as a result of his labours.

Appendix 5, though, perhaps, not relevant to the present report, may interest you as showing that, at this office, 820 vessels have been reported, with a total of 1,977,534 tons, and with masters and crews aggregating 43,456, and that 63,722 passengers have been brought.

All respectfully submitted by your obedient servant,

JAMES J. RILEY,
Superintendent of Pilots.

6-7 EDWARD VII., A. 1907

APPENDIX 27

REPORT OF THE PORT WARDEN AT MONTREAL FOR THE YEAR
ENDING DECEMBER 31, 1906.

MONTREAL, January 7, 1907.

Honourable L. P. BRODEUR,
Minister of Marine and Fisheries,
Ottawa.

SIR,—I have the honour by direction of the council of this board and in compliance with section 31 of the Act governing the Port Warden's office, 45 Vic., chap. 45, to transmit herewith documents as follows:—

1. Port Warden's annual report for the year 1906.
2. Audited statement of receipts and expenditures of the Port Warden's office for the year ending December 31, 1906.
3. Statement of investments of Port Warden, surplus funds.

I have the honour to be, sir, your obedient servant.

GEO. HADRILL, *Secretary.*

MONTREAL, December 31, 1906.

To the President and Council
of the Montreal Board of Trade,
City.

GENTLEMEN,—I have the honour to submit the annual report of the business of this office, with the statements of exports, receipts and expenditure for the year 1906.

Navigation opened this season by the arrival of the steamships *Campana* and *Polino* at noon April 20.

The first ocean vessel to arrive was the Donaldson Line ss. *Marina* from Glasgow at 3 p.m., April 28, followed by the ss. *Montfort* at 4 p.m. same day.

The first sailing vessel to arrive was the Russian barque *Waltikka* from Luderits bay, South Africa, in ballast. She loaded lumber for Monte Video. There were only two oversea or foreign-going sailing vessels in port this season, this trade is rapidly becoming extinct.

The Strait of Belle Isle was reported open and clear of ice the first week in June, which is unusually early. The ss. *Manchester Shipper* reported, passing out at Belle Isle on June 9. The telegraphic communication with Belle Isle is becoming more important and advantageous each season.

The last ocean vessel to sail hence this season was the Elder Dempster Co's. ss. *Dagama*, which brought a cargo of southern pine and left port on December 2 at 10 a.m., getting safely through to Quebec the next day.

The improvements in the buoying, lighting, and deepening of the ship channel are steadily and satisfactorily progressing. Vessels are now able to come up at any hour of the night, in clear weather, and we are informed that there is not less than 30 feet of water at the lowest state of the river in any part of the ship channel between Montreal and Bastiscan. Permanent lighthouse piers, to replace the light-ships in Lake St. Peter, and new permanent ranges throughout the ship channel between this port and Quebec are of great advantage to the safe navigation of the river.

6-7 EDWARD VII., A. 1907

There has been no mishap to any vessel in the river between this port and Quebec, this season, that can be attributed to the ship channel. The ss. *Athenia*, owing to a sudden snow squall, went aground near Cap la Roche, was quickly floated and resumed her voyage.

There have been but few accidents of any kind in the St. Lawrence trade this season, the grounding of the Montreal Trade s, the ss. *Mystic* and ss. *Kensington*, being the only mishaps of a serious nature.

Three hundred and ninety-six oversea or foreign going vessels of all kinds were entered at this office with a tonnage of 1,361,418 tons, against three hundred and seventy-eight vessels and 1,303,490 tons in 1905, an increase of eighteen vessels and 57,928 tons, compared with last season.

The business to the lower ports this season consisted of—Entered, three hundred and seventy-six vessels of all classes with a tonnage of 590,935 tons, against three hundred and seventy-two vessels of 572,401 tons, an increase of four vessels and 18,534 tons.

The total importation of coal *via* the St. Lawrence river this season was 1,615,654 tons, against 1,448,780 tons in 1905, an increase of 166,874 tons.

The shipments of various kinds for the past season manifested and reported at this office, are, as per attached statement.

All of which is respectfully submitted.

ARCHIBALD REID,
Port Warden.

APPENDIX 28

REPORT OF THE PORT WARDEN AT QUEBEC FOR THE YEAR ENDING
DECEMBER 31, 1906.

PORT WARDEN'S OFFICE, QUEBEC, December, 1906.

F. GOURDEAU, Esq.,
Deputy Minister of Marine and Fisheries,
Ottawa.

SIR,—As requested by the 30th section of the Port Warden Rules, I beg respectfully to submit the following annual statement of the business transacted in this office during the year ending December 31, 1906, as follows:—

Fifty-four steamers were surveyed for clearance outward, after taking part cargo on board at this port, having previously shipped part cargo of grain and other goods at Montreal.

Three steamers were surveyed for clearance outward after having shipped full cargo of grain and other goods at this port.

Twenty-one steamers and three sailing vessels were surveyed, their hatches opened and cargo examined, on their arrival from sea.

Four steamers were surveyed on account of grounding and stranding in the River St. Lawrence below and above Quebec.

One steamer and two barges were surveyed on account of collision damages.

Two steamers were surveyed, and their value estimated, for general average purpose.

Sixteen surveys were held on damaged goods in stores and on wharf.

The receipts and disbursements of this office, were as follows:—

Receipts from all sources.....	\$716 00
Expenses.....	464 00
	<hr/>
Balance net receipts.....	\$252 00

Besides the above, there were several vessels damaged by stranding and otherwise that did not come under the Port Warden Rules.

Two steamers took live stock at Quebec during the season, amounting in all to 861 cattle; on which, if fees had been collected as in former years, would have amounted to \$12.92, as shown by accompanying statement.

I am, your obedient servant.

W. SIMONS, Naval Architect,
Port Warden.

SESSIONAL PAPER No. 23

QUEBEC, December, 1906.

RETURN of Cattle shipped at the Port of Quebec, during the season of 1906, with the names of steamers, and amount of fees if collected, as in former years.

 No fees were collected on above cattle.

W. SIMONS,

Acting Inspector of live stock and fittings.

QUEBEC, December, 1906.

APPENDIX 29

REPORT OF THE PORT WARDEN AT HALIFAX, N.S., FOR THE YEAR
ENDING DECEMBER 31, 1906.

HALIFAX, N.S., January 1, 1907.

F. GOURDEAU, Esq.,
Deputy Minister of Marine and Fisheries,
Ottawa.

SIR,—I have the honour to submit my report for the year ending December 31, 1906, accompanied by a statement of the receipts and expenditure during that period.

Surveys have been held on twenty-two steamers and ten sailing vessels which arrived at this port in a damaged condition during the year. The necessary repairs have been made to the vessels; and those of them bound for other ports, with their cargoes, proceeded to their destinations, where all of them, except the schooner *Edwin R. Hunt*, arrived safely.

The United States schooner, *Edwin R. Hunt*, of Bath, Me., put into this port, on October 10, leaky, while on a voyage from St. Ann's, C.B., bound to Philadelphia, Pa., with a cargo of plaster rock. A portion of the cargo was discharged, the vessel placed in the Halifax graving dock and the bottom and topsides were thoroughly caulked. After the repairs were completed, the portion of the cargo that was discharged, was reloaded and the vessel sailed for her destination on the morning of November 21. She was spoken on December 13 in the vicinity of Bermuda when the master reported that his chronometer had been broken and that he had difficulty in working out his position. Up to this date the vessel has not arrived at Philadelphia.

I have the honour to be, sir,

Your most obedient servant.

DAVID HUNTER,
Port Warden.

RECEIPTS AND EXPENDITURE of the Port Warden, Halifax, N.S., from January 1
to December 31, 1906.

DR.	\$ cts.	CR.	\$ cts.
To amount of fees received as port warden	2,227 75	By paid assistants, office expenses, &c.	1,529 97
Fees for inspection of cattle fittings.	17 88	Amount reverting to port warden..	715 66
	2,245 63		2,245 63

I hereby certify that the above is a true and correct statement of the receipts and expenditure of the Port Warden at Halifax, N.S., during the year 1906.

DAVID HUNTER,
Port Warden.

F. GOURDEAU,
Deputy Minister Marine and Fisheries.

APPENDIX 46.

REPORT OF THE HARBOUR COMMISSIONERS OF MONTREAL FOR THE
YEAR ENDING DECEMBER 31, 1906.

MONTREAL, August 14, 1907.

COL. F. GOURDEAU,
Deputy Minister of Marine and Fisheries,
Ottawa.

SIR,—I have the honour, by direction of the Harbour Commissioners of Montreal, to forward herewith for the information of the Honourable the Minister of Marine and Fisheries, summarized statement of the operations of the corporation, for the year ended December 31, 1906, which covers the final year of administration under the former commissioners.

The harbour revenue was \$381,297.77, an increase of \$16,228.89 over that of the previous year. The increases were:—wharfages on imports, \$21,687.65; local wharfages, &c., \$130.88; rentals, &c., \$551.73; in all \$22,670.26, while the wharfages on exports decreased \$6,441.37, leaving the net increase as above.

The revenue from the grain elevator was \$6,885.76, a decrease from the previous year of \$5,537.77.

The cost of management, maintenance, and repairs was \$141,948.82, an increase of \$24,164.82 over the previous year. The increases were: harbour repairs, \$18,845.75, harbour dredging, maintenance, \$10,150.53, while the other disbursements on account of harbour revenue decreased \$4,831.46.

The interest on loans was \$325,485.14, of which \$270,241.50 was for harbour improvements, \$33,608.44 for the new steel sheds, and \$21,635.20 for the grain elevator.

The amount disbursed on capital account was \$580,967.04 of which \$2,174.02 was on account of the grain elevator, \$438,082.36 on account of the new steel sheds, and the balance, \$139,810.66, on account of harbour improvements.

In July, debentures amounting to \$250,000, bearing interest at 6 per cent per annum fell due and were retired by a loan obtained from the Government under the Act 6 Edward VII., chapter 35, which bears interest of 3 per cent per annum.

In addition the following loans were received:—\$50,000 under the Act 61 Victoria, chapter 47, and \$1,015,000 under the Act, 3 Edward VII., chapter 36, making a total of \$1,315,000.

SESSIONAL PAPER No. 23

The bonded debt at the 31st December, 1906, was \$8,812,000, of which \$1,972,000 is due to the public, and \$6,840,000 due to the government, upon which the average rate of interest is 3.42 per cent.

The reports for the year of the Harbour Master, and the Chief Engineer, on the works for the improvement and maintenance of the harbour will be forwarded to you shortly.

I have the honour to be, sir,

Your obedient servant,

DAVID SEATH,
Secretary-Treasurer.

REPORT OF THE WORKS FOR THE IMPROVEMENT AND MAINTENANCE
OF THE HARBOUR OF MONTREAL FOR THE YEAR 1907.

John Kennedy, M. Inst. C.E., Chief Engineer.

HARBOUR COMMISSIONERS OF MONTREAL,
CHIEF ENGINEER'S OFFICE,
MONTREAL, January 31, 1907.

DAVID SEATH, Esq., Secretary, &c.,
Harbour Commissioners of Montreal.

DEAR SIR,—I beg to submit for the information of the Board of Harbour Commissioners, the following report upon the works in the harbour of Montreal for the year ended December 31, 1906.

NEW WORKS.

The principal works carried on during the year were, the enlargement of the deep-water areas in the basins of the harbour and in St. Mary's current by dredging; the depositing of back filling on the Bickerdike pier, and along shore to protect banks and serve for future wharfs; the extension of the system of railway tracks on the wharfs and the continuation of the building of steel freight shed.

The principal details are as follows:—

Section 1, downstream side of Victoria bridge abutment.—A large quantity of filling materials, consisting of cellar excavations, ashes, road scrapings, &c., have been delivered free of cost to the Commissioners, from various sources in the city, and spread under direction of the Commissioners' men, to form an embankment for future wharf areas.

Sections 5 S. to 11 S., inclusive, Bickerdike Pier.—The work of extending the high-level wharf was resumed on April 26 by derricks, which began to deposit filling material on the front part of the pier, section 11 S., and the work was continued by one to three derricks until May 29, when 30,775 cubic yards, scow tally, had been deposited, approximately enough to complete the back filling of the pier. In addition 22,000 cubic yards, cart tally, of cellar excavations, ashes, &c., were brought from the city in carts, free of cost to the Commissioners, and deposited under the direction of the Commissioners' men. A part of this was built into a graded roadway ramp in section 10s adjoining the rear side of the pier, by which timber, lumber and other articles can be transferred from or to the water by wagons.

As the derrick filling of 1906 has not been levelled back, no addition has been made to the wharf space available for berthing ships, which remains as at the close of last year, viz.: a length of 2,500 feet measured from the upstream end of Windmill Point basin

Section 4.—A new roadway, 30 feet in width was made between Riverside street and the upper side of Windmill Point basin, and properly graded and macadamized.

Expenditure in 1906—

Filling and grading	\$ 3,530 02
Dredged material for filling.....	7,550 81
	<hr/>
Total.....	\$11,080 83

Sections 1 to 5.—A fence was built from the Mill street sewerage pumping station to the abutment of the Victoria bridge, on the high-level along the boundary line between the harbour and the adjoining properties, as established by the decision of the Imperial Privy Council. Granite boundary stones were put in on this line, between August 24 and September 1.

SESSIONAL PAPER No. 23

An area of harbour property, about 45,000 square feet in extent on sections 3 and 4, formerly occupied by the Grand Trunk Railway Company's sheds, was levelled and made available to let for piling space or other use in connection with the harbour.

Expenditure, \$445.97.

RAILWAY TRACKS.

Sections 4 N to 10 N.—In January, two tracks were laid at the request of the Grand Trunk Railway Company, from their new elevators downwards, the two tracks together measuring 1,510 feet, or 0.2864 mile. The existing railway tracks on the north-west side of Windmill Point basin, from the upstream end of the new Grand Trunk elevator upwards, were rearranged, and 3,929 feet, or 0.7441 mile, of new track was laid at the request of the Grand Trunk Railway, early in the season.

Expenditure \$11,111.91.

Sections 5 N and 6 N.—Rearrangement of tracks was necessitated by the break in the culvert at the upper end of the Windmill Point wharf.

Expenditure, \$318.04.

Sections 15 and 16.—A new track was, at the request of the Canadian Pacific Railway, laid between the sides of steel sheds 7 and 9, King Edward pier, and the edge of the pier.

The track is designed for the loading and unloading of heavy goods direct from car to ship vice versa. The track is of 80 lb. steel rails, Am. Soc. C. E. section and measured from its junction with the shore wharf tracks to the outer end of the pier, is 1,315 feet, or 0.249 miles in length.

Expenditure, \$5,538.92.

Sections 42 and 43.—The siding built in a former year for the use of the Canadian Pacific Railway, was extended 477 feet down stream.

Expenditure, \$1,171.99.

Sections 46 to 55.—The railway embankment and track upon it, for use of the Great Northern Railway, which were almost completed at the end of 1905, were finished early in the spring of 1906. Opposite the property of the St. Lawrence Sugar Refinery, sections 46, a ramp which led to refinery property, was removed, the wharf graded to proper level and the new track extended in a straight line and connected with previously existing main line tracks on the wharf. The length of the new line, as finished, is 5,500 feet, or 1.04166 mile.

A siding was laid alongside the new main line from sections 46 to 48, at the request of the Great Northern Railway of Canada, from the St. Lawrence Sugar Refinery eastwards. It is of 80 lb. rails and 1,200 feet long from point to point of switches.

Expenditure in 1906 :—

Main track and embankment	\$4,340 46
Siding	2,773 38
	<hr/>
Total	\$7,113 84

Mackay Pier.—A small portion of the tracks was levelled up at the end of July.

Expenditure, \$215.41.

STEEL FREIGHT SHEDS.

The building of the steel freight sheds on the high-level wharfs and piers, sections 12 to 18 inclusive, was continued throughout the year. The chief items of work done and the general condition of each shed at the end of 1906, are as follows :—

Shed No. 2. At the end of 1906 the shed was fairly advanced, the scoria block paving had been laid on the lower floor, and the shed was in use by Messrs. H. and A. Allan. After the close of navigation, in November, 1906, the scoria block paving which was objected to by the shipping companies as being too rough for hand trucking, was taken up, and preparations made to lay a concrete floor.

6-7 EDWARD VII., A. 1907

The reinforced concrete bed of the upper floor was in place, except the side strips, and the concrete roof and roof covering laid. Nearly all the steel work of the conveyor gallery was erected and its concrete flooring and roofing made. The corrugated iron covering of the end was partly erected, and the rolling up doors of the end ramps were up.

Shed No. 4, Alexandra pier. At the end of 1906 the steel work of the shed and conveyor gallery was nearly erected. The reinforced concrete bed of the upper floor and part of the concrete roof was laid. The earth-filling of the lower floor was in place and it had been covered with plank by the shipping companies and the lower storeys used for cargo throughout the summer.

Shed No. 7, King Edward pier. The steel work of the shed and its conveyor gallery was nearly all erected at the end of 1906. The overhang beams on the basin were cut so as to give sufficient clearance for a railway track between the shed and the edge of the wharf.

The concrete foundation bed of both the upper and the lower floors was laid except the side strips. The concrete roof of the shed and the concrete roof of the conveyor gallery was nearly all laid.

The lower floor of this shed was used by the shipping companies during the season of navigation.

Shed No. 8, King Edward pier. During 1906 the foundations of the shed were laid and the greater part of the steel work erected.

The concrete foundation bed of the upper floor, and the cinder concrete roof were nearly all laid. The shipping companies laid a temporary plank floor and used the lower floor of the shed during the greater part of the season of navigation.

Shed No. 9, King Edward Pier. The steel work of this shed and its conveyor gallery was nearly erected at the end of 1906. The overhang beams on the basin side were cut so as to give sufficient clearance for a railway track between the shed and the edge of the wharf.

The concrete foundation bed of both the upper and lower floor was laid except the side strips. The concrete roof of the shed and the concrete roof of the conveyor gallery were nearly laid.

The lower floor of the shed was used by the shipping companies during the season of navigation.

Shed No. 10, King Edward pier. During 1906, the foundation of this shed was laid, and most of the steel delivered on the ground but not erected. Some filling was done between the walls.

The surface of King Edward Pier, between the sheds was partly cut down so as to lay the tracks alongside of sheds to proper level.

Shed No. 12, Jacques Cartier pier. The only work done to this shed in 1906, was the erection of the steel work and the laying of the concrete roof. The shipping companies laid a temporary plank floor and used the lower floor, for the greater part of the season of navigation.

A large quantity of material had been delivered on the ground, but nothing had been done to the erection of any of the other seven sheds up to the end of 1906.

DREDGING.

The dredging of the year was done in the following places:—

In the channel, above Victoria pier, leading to Lachine canal and to Windmill Point basin, sections 12 and 12 S. to section 20 inclusive; in the basins between the Lachine Canal entrances and the Alexandra pier; in the basins between the Alexandra, King Edward, Jacques Cartier and Victoria piers, and continuing the dredging of the new deep water channel between Victoria Pier and the Longueuil bar.

In the deepening of the basins, where the bottom is hard rock, it has generally been made to 29 feet at lowest water of 13 feet on the lock sill, which for basins where vessels move slowly equals more than 30 feet in the open channel where they are under way.

SESSIONAL PAPER No. 23

The following are the details of the work :—

Sections 12 and 13.—Basin between the canal entrances and the Alexandra pier. The greater part of the basin was gone over and dredged to obtain 29 feet clear depth at 13 feet on the sill in 1905. Certain areas of rock that were found too hard to dredge economically were blasted, but had not been dredged at the end of the working season of 1905. The greater part of this blasted rock, and certain other shallow spots, were dredged in 1906. There now remains to be removed only a few small isolated obstructions to give a clear depth of 29 feet with 13 feet on the lock sill.

Sections 14 and 15.—Basin between the Alexandra and King Edward piers. A small area opposite the outer end of Alexandra pier. Section 14, and a small area in the basin and also strips alongside Alexandra and King Edward piers, section 15, were dredged to obtain the clear depth of 29 feet of 13 feet on the sill. The actual depth has not been tested, but little work remains to be done.

Sections 16 and 17.—One, and in places two dredge cuts have been made alongside the wharfs and piers, in the basin, to complete the 29 feet depth at 13 feet on the sill, close up to the berths. This dredging has not yet been tested.

Section 19.—Strips alongside part of the shore wharf and alongside part of Jacques Cartier pier, and also a lump in the basin near the outer end of the pier, were dredged to complete the depth to 29 feet at 13 feet on the sill, but have not yet been tested.

Section 20.—A small area of shallow water opposite the outer point of Victoria pier, which obstructed the entrance to the basin section 19, has been dredged to make 29 feet depth, but has not been tested.

Main channel, sections 12, 13, 14 and 14 S.—Dredging was continued here to complete a clear depth of 29 feet at 13 feet on the sill. Several isolated lumps of rock were taken off and also the area of rock blasted last year. Testing, at the close of the year, indicated, still a few stones to be lifted.

Sections 17 S., 18 S. and 20 S.—Small areas on these sections, on the south side of the channel towards the Mackay Pier, have been dredged to make 29 feet at 13 feet on the sill, but has not yet been tested.

Sections 21 to 46, Ship Channel, Victoria Pier to Longueuil Bar.—The work of providing a deep channel through the St. Mary's current, called for the present "the New Ship channel through St. Mary's current," was continued throughout the season, as stated in last year's report. The work consists of deepening a channel lying to the north-west, or city side of the present ship channel, for the greater part of the length, adjoining the old channel just below the Victoria pier and about opposite section 46, of the minimum breadth of 450 feet and of 30 feet depth at extreme low water of 13 feet on the lock sill. Dredging was resumed on the opening of navigation and continued until the close of the season. Two dredges were employed most of the time and the area worked upon was that between sections 21 and 42. Certain lumps that remained in the dredged part of the channel at the end of 1905 were removed, and the main cutting was continued upstream until at the beginning of October. The new channel had been finished and tested to a width of 450 feet, and a clear depth of 30 feet at 13 feet 7 inches on the sill, (the depth to which the 30 foot channel in the river is being dredged by the Department of Marine and Fisheries) from the Longueuil bar to its junction near Victoria pier, with the present channel of 25 feet 3 inches at 13 feet on the sill. At its upstream junction with the old channel, and between that channel and the wharf, there was sufficient width of deep water (300 to 600 feet width) to allow the traffic to pass through the new channel. On October 5, four steamship pilots were taken through the new 30 foot channel on a Harbour Commissioners' tug, and at later intervals, any other pilots who wished, were taken through at any time they applied. Altogether, thirty pilots were shown through; and they expressed themselves as well pleased with the currents, marks and other conditions for navigating the new 30 foot channel. During the remainder of the season of navigation the new channel was used by many of the large ships.

Sections 43 to 47.—Considerable deepening was done by the W. J. Poupore Company in the basin above and that below the Tarte pier, and below the Sutherland pier, to procure material for the filling of the Tarte pier. This deepening was done free of

6-7 EDWARD VII., A. 1907

cost to the Harbour Commissioners, the Poupore Company being allowed to use the dredged material for filling.

Section 47, Maisonneuve.—A small quantity of deepening, by dredging, was done for the immediate purpose of obtaining sand for blinding the roadways.

Mackay Pier.—A large part of the material, dredged from the harbour, in sections 4 to 24, was deposited on the lower 1,200 feet of the Mackay pier, to protect the pier, (making a bank for a railway ramp to low level), and to avoid the long haul of the materials to Maisonneuve, there being no nearer available place for dumping. The rocky and durable materials were dumped on the outside and on the downstream end of the pier, and the softer, put inside.

Expenditure, \$24,340.61.

Sections 47 to 51.—Almost the whole dredgings raised from the harbour basins and the ship channel during the year, apart from that placed on the Mackay pier, and a small quantity for building roadways, were deposited along shore sections 47 to 51; the gravelly and harder materials were placed along the outer or river side of the railway embankment used by the Great Northern Railway of Canada, and the soft material was thrown over the bank to fill the large vacant spaces existing in certain places, on the harbour property between the shore and the railway embankment.

Expenditure, \$22,113.51.

GENERAL NOTES.

Montreal Warehousing Co's. Elevator, Section 9 N. Windmill Point Wharf.—The new steel elevator, built by the Montreal Warehousing Co., which was nearly completed at the end of 1905, was finished in the spring of 1906. The opening ceremony took place on April 28, after which the elevator was put into regular use.

MAINTENANCE AND REPAIRS.

The total cost of maintenance and repairs to harbour works in 1906, including the cost of removing the ice given below, is \$75,589.58, and it compares as follows with the expenditure of former years.

1875.....	\$16,499	1891.....	\$49,109
1876.....	35,711	1892.....	72,179
1877.....	26,077	1893.....	58,644
1878.....	18,974	1894.....	75,455
1879.....	18,819	1895.....	50,081
1880.....	17,330	1896.....	55,211
1881.....	16,159	1897.....	46,259
1882.....	27,962	1898.....	58,847
1883.....	35,678	1899.....	52,252
1884.....	44,869	1900.....	42,679
1885.....	42,158	1901.....	79,461
1886.....	64,986	1902.....	71,109
1887.....	64,984	1903.....	123,097
1888.....	49,520	1904.....	82,857
1889.....	51,892	1905.....	56,631
1890.....	59,380	1906.....	75,590

The breaking up of the ice.—Spring of 1906.—The ice formed in the fall of 1905 with less packing and shoving than usual. There was no ice-road during the winter of 1905-1906 from Montreal to Laprairie, nor from Montreal to St. Lambert, but there was one from Longueuil to Hochelaga. On March 20th the spring movement of the ice began. Local openings appeared and closed again and several local movements of the ice took place between Longueuil and the upper end of Nun's Island, accompanied by only moderate fluctuations of the water level until April 7, when the water stood at 27

SESSIONAL PAPER No. 23

feet 6 inches on lock sill. The main shove of the spring then occurred. The water rose six feet in fifteen minutes and eight inches more in the next fifteen minutes, reaching 34 feet 2 inches on the sill, the highest level of the spring of 1906. There was no further shoving of importance. The water lowered rapidly and almost continuously until April 9 at noon, when it had lowered to 25 feet 6 inches on the sill. It continued to lower, but more slowly until April 19 when it reached 17 feet 9 inches on the sill, an unusually low stage for spring. During the shoving, the ice did not move appreciable in the basin of the harbour within the McKay pier, sections 4 to 14, but on the sudden rise in the outer harbour on April 7 the water rushed in within Mackay pier and Jacques Cartier pier with such force as to move the whole field of ice between the end of the basins and Mackay pier upwards and carry with it the Commissioners boom and inclosed timber, and to sweep loose sticks long distances, under the ice-sheet on the Point St. Charles shoals.

The general shoving having been light and the water having risen only to a moderate extent, only a comparatively small quantity of ice was left upon the wharfs.

From the head of the harbour, down to the Victoria pier, section 20, that is, within the area protected by the Mackay pier, the wharfs were left practically clear. On the Victoria pier, section 20, an area of 150 feet by half the width of the pier, was covered with ice to an average depth of 8 feet. At the island ferry berth, an area of 60 feet by 15 feet was covered with ice to an average thickness of 3 feet. From the Victoria pier, section 20, to the rubber factory, section 27, ice was piled along the front of the wharf, extending back from the edge an average distance of 45 feet and about 4 feet average thickness. From the rubber factory, section 27, to the coal towers, section 34, the ice was piled along the front of the wharf extending back from the edge an average distance of 40 feet and about 3 feet average thickness. From the coal towers, section 34, to the Laurier pier, section 43, the ice was piled along the edge of the wharf, extending back from the front an average distance of 25 feet and about 6 feet average thickness.

Two thirds of the Laurier pier, section 43, was covered with ice for the full width to an average depth of 5 feet. About 40 feet of the outer end of the Sutherland pier, section 46, for its full width, was covered with ice 3 feet average thickness.

The removal of the ice from the Longueuil ferry berth was begun on April 14, and the ferry boat began the regular trips on the 16th, at which date the steamer *Prefontaine* arrived from Sorel.

The removal of the ice from the Victoria pier was begun on April 16, and at other points where necessary, and the whole work of ice removal was completed on May 3.

The largest number of men employed at one time was 68 as compared with 35 in the spring of 1905, 364 in 1904 and 700 in the spring of 1903.

Expenditure \$1,948.18

The general cleaning of the wharfs of winter rubbish, and placing the mooring posts, lights, &c., was commenced on April 16.

The principal repairs to the wharfs which were carried out throughout the summer were as follows:

Section 4, Culvert from Ogilvie Flour Mills.—The screen at the mouth of the culvert to break the force of the current, was repaired twice.

Sections 4 to 8, Windmill Point Wharf.—The iron ladders were renewed from the offset in the wharf, opposite Black's bridge, to the upper end of the basin.

Section 5, Ogilvie Street.—Ogilvie street, from Mill street to the wharf, was graded, macadamized and rolled with a steam roller. Work began June 27th, and was finished July 4th.

Section 6, Raceway from Peck Rolling Mills.—Raceway No. 6, carrying water from the Mills on Mill street, under the wharf and into the Windmill Point basin, failed on the 17th of September. Work was immediately begun repairing it, and the work was still under way at the end of the year.

An examination by diver, of all the culverts through the Windmill Point wharf was made, and all were found in good condition except Raceway No. 1, opposite Blacks bridge, which failed in 1904 and which was, in part, repaired, and Raceway No. 6 from the Peck Rolling mills which failed in September of this year, as stated above.

6-7 EDWARD VII., A. 1907

When examining the condition of the culverts, the condition of the cribwork of the wharf was also examined and it was found to be sound and good, except for a length of 125 feet of the wharf immediately below Raceway No. 7 which was found to be undermined and 2 to 3 feet off the bottom.

This space was partly underpinned with concrete in bags, but the weather becoming cold, the work was abandoned until the spring.

Expenditure in 1906, \$14,976.95.

Section 8, Windmill Point Wharf.—A small undermining at the corner of the wharf in Section 8, was filled with concrete in bags.

Section 8, Intercolonial Coal Co's allotment.—The space allotted to the International Coal Co., for piling coal, was graded and rolled. Work was begun April 24, and was finished May 21.

Section 11.—Between the two entrances of the Lachine canal, about 25 feet, of the top planking of the wharf which had been carried away by the ice, was renewed.

Section 14, Alexandra Pier.—The iron ladders, which reach from the water level to the top of the pier, were repaired and renewed throughout.

Section 16, King Edward Pier.—The hardwood plank, on the downstream corner of the pier, which was torn off by the ice, was renewed.

Section 18, Jacques Cartier Pier.—The downstream side of the pier was damaged by the ice. The face timbers were broken in and the ends damaged for an aggregate length of 125 feet, and about 8 courses in height. The break was thoroughly repaired.

The hardwood plank of the outer downstream corner, which was also torn off by the ice, was renewed.

The iron ladders were renewed on both sides and the outer end of the pier.

Section 19, Shore Wharf.—The face timbers of the wharf were broken in by the ice, and the top planking and sleepers lifted and broken.

Tie ends were "broomed" and smashed and the longitudinals displaced and broken. The damage aggregated about 300 feet in length and varied in height from 12 inches to 2 feet. The whole was thoroughly repaired and put in good order.

Section 20a, Victoria Pier.—The piles forming the corner of the wharf at the Terrebonne's berth were broken by the ice. The old piles, which were broken were pulled out and elm piles driven in their place, and well bolted to the wharf. The iron ladders on the upstream side of the pier, which were broken, were put in good order.

Section 20 B.—Sundry repairs were made to the outer end of Victoria pier. The floor planking was renewed and new coping put on, for a length of 75 feet, and some repairs were made to the top and face plank elsewhere.

Section 20 C.—Twenty-five pieces of new face plank were placed on the downstream end of the pier, and the outer corner was protected by being re-enforced with hemlock plank put on horizontally.

Section 20 E.—The work of completing the extensive repair to the inshore side of the pier, which was begun in 1904 and continued in 1905, was resumed as early in the season as the river level would permit.

The piles to within 50 feet of the upstream end had been cut off below where they were rotten in the fall of 1905, a few of the new tops had been put on the piles so cut, and some new caps were put on, when the raising river forced the abandonment of the work until the spring.

In the spring of 1906 new heads were spliced on the tops of the piles, new floor beams and joists were built on top, and the planking relaid. Work began April 15 and was finished May 28. Some necessary bracing was done in July.

A slip was made in the shore wharf, section 20, for the use of the steamer *Prefontaine*.

A slip was made in the inshore of the pier for the accommodation of the steamer *Gaspesian*, in October.

Section 20, Berri St. Ramp.—The guard timbers on the upstream and downstream slopes of the ramp, were repaired and renewed in part.

Sections 20 to 23.—One hundred and thirty piles were driven along the face of the wharf, to replace rotten ones, some of which had been broken and others which had been carried away by the ice.

SESSIONAL PAPER No. 23

The upper three courses of the wharf for a length of 300 feet had been broken by the ice and were thoroughly repaired, new face timber, sleepers and top planking were put on.

Thirty feet of new coping was put on the upstream pony crib of the new wharf, section 23. The work was done during the month of May.

Sections 24 to 27.—The front and top of the wharf in these sections, were rotten in part and broken by the ice in part. An aggregate of 625 lin. feet of new coping was put on, 700 lin. feet of the face was replanked, 250 lin. feet of the wharf had new sleepers under the top planking put on, and 500 lin. feet of the top of the wharf was replanked. The work began May 1, and was finished May 12.

Sections 28 to 30.—The face planking of the wharf, for 3 feet down from the top and for an aggregate length of 127 feet, was renewed. Two hundred lin. feet of new coping was put on, the top plank renewed for an aggregate length of 100 feet, and the corner of the wharf reinforced with hardwood plank. The work was done in May and July.

Sections 31 to 34.—An aggregate of 550 lin. feet of new coping was put on, new sleepers under the top planking were put in for 200 lin. feet of the wharf, and the planking relaid.

Hundred and twenty-five piles were driven along the front of the wharf, cut off near the water line, and bolted to the wharf, a waling piece put on the tops of the piles and the face of the wharf between the waling piece and the coping was re-planked for a length of 250 feet.

A repair was made to the corners of the slip of the Longueuil ferry and also to the corners of the slip at the Boucherville ferry berth.

Section 35, cattle space.—Three hundred and twenty-five lin. feet of the front of the wharf was rebuilt for seven courses down from the top. The three top courses had been broken by the ice, and the remaining four courses had become rotten and shaky.

New cross and longitudinal ties were put in, new sleepers and top and face planking put on.

THE MOORING POSTS WERE RE-SET.

Sections 35 to 37, Dominion Coal Co's. Tower, Hochelaga.—After the lowering of the river in spring a length of 70 feet of the wharf was found to be somewhat sunken. On examination by diver, the cribwork was found to be sound, but undermined by the winter scour.

35 piles were driven along the front, close together; these were cut off near the water line, bolted to the wharf and a cap or waling piece put along their tops. The coping was renewed and the top and face planking re-laid.

Sections 40 to 43, Shore Wharf and Laurier Pier.—The downstream corner of the pier was re-inforced with hardwood plank, the ladders throughout the pier were renewed and repaired, 30 lin. feet of new coping was put on and some small repairs made to the face and top planking.

Section 46, Sutherland Pier.—The whole length of the upper part of the downstream side of the pier and of the adjoining shore wharf, altogether 650 lin. feet, which had become much decayed were re-built for an average of four courses from the top. The top planking was reduced from 12 to 7 feet in width, and a large portion of the old sleepers was again used, the wood being sound.

Some of the top planking was re-laid with the plank which had been removed in re-building the wharf, and an aggregate of 400 lin. feet was planked with new plank.

A steel plate was placed on the upstream corner for protection against ice shoves.

225 feet hemlock coping was put on the upstream side and the face plank renewed in many places.

Sections 61 and 62, Racine Wharf.—Wharf at Locomotive and Machine Co's. property.

The filling at the downstream end had run out of the pony crib and undermined the tracks to a small extent.

6-7 EDWARD VII., A. 1907

The planking of the top was removed and the crib filled with rock by a derrick, the track well packed and the top planking replaced.

Section 74, Lemay Wharf.—A small repair was made to the slip in the wharf opposite the property of the St. Jean de Dieu Asylum.

4 scow loads of rock filling were put on the pier to replace the filling which had been scoured out.

Section 75, Doran Wharf.—Wharf opposite Longue Pointe Church.

The whole of the downstream side had the face planking renewed, two top timbers and the coping of the upstream side were renewed, and the flooring and side of the slip in the wharf were replanked.

GENERAL REPAIRS AND PATCHING.

The general repairing of the planking and timber work of the wharfs, which began on May 5, was carried on during the whole summer, and extended practically throughout the harbour, the bulk of which, however, was between the Victoria pier, section 20, and the Sutherland pier, section 46.

Roadways on the Wharfs.—The usual repairs and maintenance of the roadways of the wharfs throughout the harbour were begun on April 21, and stopped on November 28.

Latrines and Drinking Troughs.—The latrines of the low level wharfs which were stored away for the winter, were repaired and painted in the early spring and placed in position and the water service connected with them, and also with the water troughs, between April 28 and May 26. They were disconnected and stored away for the winter at the end of December. New wooden catch-basins were put under the drinking taps outside of the latrines.

The usual sweeping, scraping and watering of the wharfs was carried on throughout the season. The repairing of the wharf plant and tools was done in the commissioners yard, Papineau Avenue. The water carts, road scrapers, carts, sleighs, &c., were kept in thorough good order. The picks and other small tools were repaired in the blacksmith's shop and a large quantity of other smithwork required for wharf repairs was also done there.

Macadamizing stone.—The stone for macadamizing roadways were, in 1904, delivered unbroken by the contractor, and broken by the harbour commissioners' own men. The quantities used during the summer for maintenance were :—

	Tons of 2,000 lbs.
Sections 5 S and 6 S.....	493
“ 4 N to 10 N.....	664
“ 12 “ 19.....	2,359

“ 28 “ 34.....	277
“ 35 “ 38.....	353
“ 39 “ 46.....	187
Total.....	5,330

Electric lighting—The lighting of the wharfs was continued throughout the summer by the Montreal Light, Heat and Power Co., under contract.

Lighting commenced on April 31 with 61 lamps.

On May 1 the number was increased to.....	72
“ 2 “ “.....	85
“ 3 “ “.....	94
“ 5 “ “.....	105
“ 10 “ “.....	138

and on June 14, the whole circuit of 165 lamps was in operation. The largest number of lamps, burning at any one time was 167, which included two special lamps at the

SESSIONAL PAPER No. 23

repair shop, being carried on at Raceway No. 7, Windmill point. All the lamps were kept in operation until the night of December 7, when the number was reduced to 124.

This number was further reduced to 87 lamps on December 11, and on December 26, the lighting was discontinued for the season, with the exception of three lamps which were kept burning at Raceway No. 7.

The total lighting of the season was equivalent to 36,913 lamps burning one night.

The cost of lighting was \$7,362 12

Buoys and Beacons.—Three black spar buoys to mark out the south side of the channel between lower end of Windmill Point basin and the Mackay pier, were placed and maintained during the season.

A red spar buoy was placed on the north side of the Longueuil bar, to mark out the end of the shoal at the Sutherland pier.

Four red buoys and seven black buoys were placed and maintained until the end of the season, in the new ship channel leading from Longue Pointe to the new wharf opposite the locomotive works, section 62.

Two rectangular beacons were placed by the commissioners at sections 41 and 42 to mark the line which leads from the ship channel into the upper part of the harbour. Red lights were maintained on these beacons by the Department of Marine and Fisheries, and also on two poles which were erected by the department at Bellerivè Park, sections 31 and 32.

The following beacons were put up to mark out the new 30 feet channel through the north side of the current St. Mary, viz.: a pair of rectangular beacons, one in rear of section 34 and the other on section 35, showing the new ship channel from the upper side of the Longueuil bar inward, towards section 35; another pair of rectangular beacons, one on section 43 and the other on section 46 showing the new channel from the latter reach upstream to section 30; and a third pair of rectangular beacons on section 38 showing the new ship channel from section 30, also upstream, into the part of the harbour above Victoria pier.

Maintenance dredging.—Dredging for maintaining the harbour in 1906 was as follows:—

Sections 5 S to 7 S inclusive, southeast side half of Windmill Point basin and Sections 5 to 7 inclusive of the northwest side of the same basin were dredged over the greater part of their area to make a clear depth of 25 ft. 3 in. at 13 ft. on the sill. The dredging consisted of clearing out of various deposits that had accumulated during the last ten years chiefly from the Mill Street sewer and raceways from the Lachine canal and from coal spilled over board at the coal berths, and washings from the wharfs. The greater part of the area dredged has been tested and found clear.

Sections 20, 21 and 22.—A dredge cut was run along side the wharf of these sections, to clear away obstructions so as to allow vessels of 25 ft. 3 in. draft at 13 ft. on the sill to be brought close to the wharf.

Sections 35 and 36, Dominion Coal Co's. Berth.—A dredge cut was made alongside a part of the wharf, clearing off obstructions to a depth of 25 ft. 3 in. at 13 ft. on the sill, as close to the wharf as practicable.

Dredging Plant.—The dredging plant used in 1906 was all owned and operated by the commissioners. It consisted of three bucket or dipper dredges, five floating derricks, five steam screw propeller tugs, three hopper bottomed scows of 200 cubic yards capacity, sixteen deck scows of a capacity of 150 cubic yards each, and three of 67½ cubic yards, besides smaller scows, floats, &c. Further particulars of the vessels are given in the annexed tables. The drilling and blasting boat was not operated in 1906.

All the dredging plant was wintered afloat, in 1905 and 1906, near the Mackay pier opposite the workshops, except Derrick No. 1, which had been hauled out in the fall of 1905 for extensive repairs during the winter and the damaged dredge No. 3, which was hauled out and wintered on the hauling-out slip.

The dredges were served throughout the summer by the Tugs *St. Peter*, *Robert Mackay*, *Aberdeen*, and *Alphonse Racine*. Service was also rendered about half the time by the *Courier*, in carrying men and stores and occasionally in towing scows, the other half of the service being given to the towing of timber for wharf building and repairs.

6-7 EDWARD VII., A. 1907

The dredges worked by day only, and all continued steadily at work from their dates of commencement until the close of navigation, except Dredge No. 1 which was run into and wrecked by the SS. *Albert M. Marshall* on October 8, and Derrick No. 3, which was laid off in consequence of the disablement of Dredge No 1.

Dredge No. 1 worked from April 26 until sunk on October 8, No. 2 from May 2, till November 29, and No. 4 from April 26 till November 30.

The aggregate number of days during which the dredging duty on the harbour works, reckoning all days except Sundays and holidays, was for No. 1, 136 days; for No. 2, 170 days; and for No. 4, 183 days, making in all 489 days and the aggregate for all the dredges throughout the season was 4,890 hours. The nominal working time of the dredges was 10 hours a day. The aggregate actual working time, that is, the time during which the dredges actually dredged, exclusive of that lost for repairs, changing positions, detention by ships, irregularities of scow service, and all other causes, was 3,384 hours, an average of about 70 per cent of the nominal working hours.

The derricks worked by day only. Derricks, Nos. 3 and 4 commenced work on April 17, clearing ice off the wharfs; No. 5 commenced work on April 27; No. 6 commenced on May 7, and No. 1 commenced on August 9. The output of the dredges is small and the cost of dredging is high because of the unfavourable conditions under which most of the work is done.

The dredging in Windmill Point basin was cleaning up and that in the harbour, above Victoria pier, was largely in rock and in taking off only a very light cut, or in cleaning cuts previously made, and the material was nearly all trap and shale rock. The dredging in the new ship channel below Victoria pier was largely in the swiftest part of the current and in isolated areas and in light cutting.

The quantity of work done in 1906 was further curtailed by the loss of No. 1 dredge for nearly two months of the working season, and part of the time of the other two dredges was taken up in the work of salvaging portions of the machinery and other accessible parts of the wreck of Dredge No. 1 in the swift part of St. Mary's current.

The cost and the character of the dredging in different parts of the harbour in 1906 are given below. All the quantities are scow measurements from the tallied number of flat deck scow loads of measured average capacity, or box measurement from the tallied number of boxes placed on scows, containing four cubic yards per box.

The cost of dredging in each case includes its proportion of all the costs of maintaining and working the dredges, tugs and scows as above stated, but does not include the cost of unloading the dredgings from the scows by derricks, which is separately given.

Aggregate dredging.—The aggregate quantity dredged at all places during the year was 246,525 cubic yards, box and scow measurement, and the average cost was 34.44 cents per yard. The material was carried on flat scows, either on the open deck from which it was unloaded by clam shells and floating derricks, or in four yard boxes which were lifted and dumped by the derricks. All the dredged stuff was thus unloaded by the derricks, and deposited in or behind crib work for wharf building and in spoil bank. The average cost of the whole derrick work, apart from the scow service, was 11½ cents per cubic yard, scow or box measurement.

The total outlay for working the whole fleet was \$113,748.60, which embraces the entire cost of working the plant and machinery including repairs, outfit, wages, salaries, management charges, insurances, allowance for depreciation of plant, and all charges of every kind, except interest on capital. The allowance for depreciation of the plant is \$18,069.64, and it includes not only the estimated depreciation of the plant in use in 1906, but that upon all the commissioners dredging plant, whether in use or not. It is also to be noted, in making comparison with previous years, that depreciation was not included in the cost of dredging in any year previous to 1896.

The cost of maintaining and working the three dredges was \$38,801.55, or an average of \$79.35 per day per dredge and an average of 15.74 cents per cubic yard dredged.

The cost of maintaining and working the five floating derricks for unloading scows was \$28,848.98, or \$39.57 per day per derrick for 729 days aggregate service, unloading dredged material and an average of 11.52 cts. per cubic yard.

SESSIONAL PAPER No. 23

The cost of maintaining and working the two tugs which attended the dredges was \$31,455.61, an average of \$32.16 per tug per day, and an average of 12.76 cents per cubic yard dredged.

The cost of the scow service was \$14,642.46, an average of 5.94 cents per cubic yard dredged.

The following are the comparative quantities and costs of dredging and unloading for 1906 and for previous years.

Years.	Cubic yards dredged.	Total cost.	Cost per cubic yard.	Kind of dredges employed.

6-7 EDWARD VII., A. 1907

The cost and character of the dredging in different parts of the harbour in 1906 are given below. All the quantities are scow measurements from the tallied number of flat deck scow leads of measured average capacity.

The cost of dredging in each case includes its proportion of all the costs of maintaining and working the dredges, tugs and scows, but does not include the cost of unloading the dredgings from scows by derricks, which is separately given.

Windmill Point Basin South side deepening.—Shale and trap rock, partly blasted and partly not blasted, with some admixture of muddy deposit from parts of the deepening work and cleaning of the bottom made in previous years. Depth of water at time of dredging, 33 to 36½ feet; quantity dredged 1,050 cubic yards scow measurement. Expenditure \$378.12. Cost per cubic yard 20½ cts.; unloading by derricks 11½ cts. Of this amount half was charged to places where the material was used and half to dredging account.

North side deepening.—Same material as above. Depth of water at time of dredging, 30 to 35 feet; quantity dredged, 2,025 cubic yards. Expenditure, \$1,628.30. Cost per cubic yard, 69 cts. unloading by derricks, 11½ cts. per yard. Of this amount, half was charged to places where the material was used and half to dredging account.

Windmill Point Basin.—South side cleaning.—Loose rock, silt and mud with accumulation of coal and sawdust deposit. Depth of water at time of dredging, 25 to 35 feet; quantity dredged, 7,050 cubic yards. Expenditure, \$2,580.92. Cost per cubic yard, 25¼ cts.; unloading by derricks, 21½ cts. per yard. Of this amount, half was charged to places where the material was used and half to dredging account.

North side cleaning.—Same material as above. Depth of water at time of dredging, 26 to 36 feet; quantity dredged, 31,275 cubic yards. Expenditure, \$14,475.64. Cost per cubic yard, 34¾ cts.; unloading by derricks, 11½ cts. per yard. Of this amount, half was charged to places where the material was used and half to dredging account.

Basin sections 12 to 14.—Between entrance to canal and Alexandria pier.—Material, rock, hardpan, sand and stones with some mud. Depth of water at time of dredging, 27 to 38 feet; quantity dredged, 39,225 cubic yards. Expenditure, \$16,255.68. Cost per cubic yard, 30 cts.; unloading by derricks, 11½ cts. per yard. Of this amount, half was charged to places where the material was used and half to dredging account.

Basin section 15.—Between Alexandria and King Edward piers.—Material, silt and mud in detached spots. Depth of water at time of dredging, 29 to 32 feet; quantity dredged, 4,575 cubic yards. Expenditure, \$1,299.12. Cost per cubic yard, 16⅞ cts.; unloading by derricks, 11½ cts. per cubic yard. Of this amount, half was charged to places where the material was used and half to dredging account.

Basin sections 16 and 17.—Between King Edward and Jacques Cartier piers.—Material, silt and mud in small spots. Depth of water at time of dredging 29 to 37 feet; quantity dredged, 15,375 cubic yards. Expenditure, \$5,093.28. Cost per cubic yard, 21½ cts. Unloading by derricks, 11½ cts. per yard. Of this amount, half was charged to places where the material was used and half to dredging account.

Basin, section 21.—Inside Victoria pier.—Material, silt and mud in small areas. Depth of water at time of dredging, 26 to 35 feet; quantity dredged, 6,825 cubic yards. Expenditure, \$2,937.24; cost per cubic yard, 31½ cts.; unloading by derricks, 11½ cts. per yard. Of this amount, half was charged to places where the material was used and half to dredging account.

Section 36.—Dominion Coal Co's. berth.—Cleaning out silt and deposit alongside wharf. Depth of water at time of dredging, 28 feet; quantity dredged, 800 cubic yards. Expenditure, \$307.26. Cost per cubic yard, 26⅞ cts.; unloading by derricks, 11½ cts. per yard. Of this amount, half was charged to places where the material was used and half to dredging account.

Basin, section 46.—Below Sutherland pier.—Material, sand for blinding roadways. Depth of water at time of dredging, 33 to 34 feet; quantity dredged, 2,400 cubic yards. Expenditure, \$826.06. Cost per cubic yard, 24½ cts.; unloading by derricks, 11½ cts. per yard. Of this amount, half was charged to places where the material was used, and half to dredging account.

Sections 12 to 20.—Material, principally shale and trap rock, partly blasted in former years, with some silt and stones. Depth of water at time of dredging, 28 to 37

SESSIONAL PAPER No. 23

feet ; quantity dredged 39,675 cubic yards. Expenditure, \$18,992.42. Cost per cubic yard, 36 $\frac{2}{3}$ cts. ; unloading by derricks, 11 $\frac{1}{2}$ cts. per yard. Of this amount half was charged to places where the material was used and half to dredging account.

Sections 21 to 36.—Ship channel in current St. Mary's. Material, hardpan, gravel, sand and boulders, chiefly in small detached shoals. Depth of water at time of dredging, 28 to 40 feet ; quantity dredged 96,250 cubic yards ; expenditure, \$48,535.22 ; cost per cubic yard, 39 cts. ; unloading by derricks 11 $\frac{1}{2}$ cts. per yard. Of this amount half was charged to places where the material was used and half to dredging account.

Section 12.—Surplus dredgings to the extent of 8,625 yards were deposited by derricks in spoil bank near the ship yard. Half cost of material, charged to place of deposit, \$1,766.59.

Mackay Pier.—Surplus of dredgings were deposited by derricks during the season on the lower end of the guard pier, principally on the outer side. 110,660 cubic yards. Half cost of dredging and derrick work charged to place of deposit, \$24,340.61.

Sections 50 to 53.—Spoil bank on river beach. Surplus dredgings, that is dredgings beyond those which were required for construction work, to the extent of 80,265 cubic yards, seow measurement, were deposited by derrick along the river beach in sections 50 to 53, in such way as to be available for forming part of future wharf filling or embankment for extension of railway tracks. Half cost of dredging and derrick work charged to spoil bank, \$18,715.

Appended are tables giving additional particulars of the dredging work and dredging plant, and of the repairs done in 1906.

Yours respectfully,

(Signed) JOHN KENNEDY,
Chief Engineer.
